SANITARY ENGINEER

PLUMBER & STEAM FITTER of CANADA

Vol. XIII. Publication Office, Toronto, January 1st, 1919 No. 1

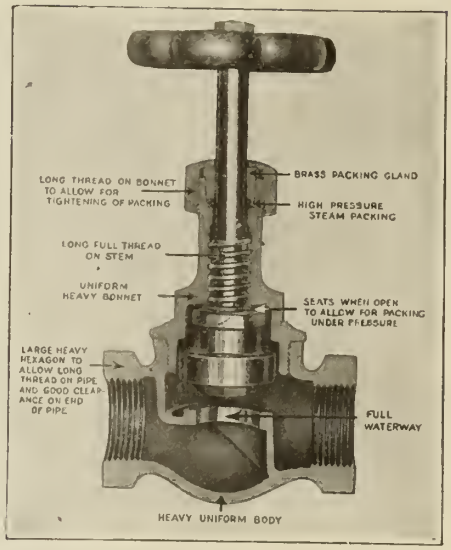
It's a Winner and We're Proud of It!

Emco Globe Valves are made in one of the most modernly equipped brass manufacturing plants under the British flag.

In examining an **Emco** you will particularly note the uniform thickness of metal, the long full threads on spindle and other features that will impress upon you the fact that you are getting full value for your money.

Emco Globe Valves are fitted with metal packing gland and are complete in every detail. Every valve is packed with high-grade packing before it leaves the factory.

We can make prompt shipments from stock. Let us quote you our prices on your next brass goods requirements.



LONG THREAD ON BONNET TO ALLOW FOR TIGHTENING OF PACKING
BRASS PACKING GLAND
HIGH PRESSURE STEAM PACKING
LONG FULL THREAD ON STEM
UNIFORM HEAVY BONNET
SEATS WHEN OPEN TO ALLOW FOR PACKING UNDER PRESSURE
LARGE HEAVY HEXAGON TO ALLOW LONG THREAD ON PIPE AND GOOD CLEARANCE ON END OF PIPE
FULL WATERWAY
HEAVY UNIFORM BODY

Dominion Rubber System Belting Insures Maximum Service

Dominion Rubber System Belts are built to a scientific quality standard which insures the proper width, thickness and type of construction to efficiently serve a given purpose.

Dominion Rubber Systems Belts are *one-piece belts*—with absolute uniformity, dependability, economy and satisfaction built into each foot.

The layers of strong endless fabric are saturated and embedded in special rubber which gives a toughness that is practically indestructible.

Its rubber surfacing has a tested pulley grip greater than that of any other belt made, hence it allows minimum power leakage.

Where water, acids, oils, dust, grit, belt-shifters, etc., soon ruin ordinary belting, there is a type of Dominion Rubber System Belting that will withstand the severest punishment and eliminate many replacements and delays.

The largest users of belting in Canada have proved the value and efficiency of our belting in actual service and through the special free service of our belting experts, have cut costs and speeded up production.

This free technical service is yours to command whether you are a customer or not and it opens the door to the entire facilities of the largest rubber organization in Canada with a fifty year record for producing dependable products.

If your belting problems need emergency service, phone or wire our nearest branch.

"Dual" Mixer

A valve that really mixes Hot and Cold Water, and maintains a uniform mixture.

For ease of operation, simple construction and easy installation, it has set a new standard of efficiency.

Cold Water must be turned on first, no possibility of scalding.

Made in several forms for Showers, Sprays, Operating Rooms, etc.

At the well-known works of Messrs. Brunner, Mond & Co. these valves provide baths for 2,500 employees.

Why Jenkins Bros'. Valves are Superior

Fig 106

They are the original renewable Disc Valves. They have more imitators than all other makes of valves combined. They have kept pace with increasing steam pressures and severe working conditions. They are of the simplest design, and can be easily repaired by any man of ordinary intelligence. They are made interchangeable in every part, and any part can be duplicated promptly and inexpensively by the dealer. In the majority of cases they can be repaired by merely changing the disc without the laborious task of regrinding.

Fig. 108

They are recognized as the Standard Steam Valves in all parts of the World, and wherever there are supply houses—Jenkins Bros'. Valves will be found. The Standard of quality never changes except to improve, and while to-day there are hundreds of imitators, the sales of genuine Jenkins Bros'. Valves are constantly increasing.

Fifty Subscriptions from One Firm

THE International Business Machines Company, of which Mr. Frank E. Mutton is vice-president and general manager, subscribed to 10 copies of THE FINANCIAL POST some months ago—these copies to go to their travelling salesmen. Now this company has increased the number of these subscriptions to 50 because the results of the experimental subscriptions have proved so satisfactory.

FRANK E. MUTTON

Mr. Mutton explained that the object of putting THE POST in the hands of the men of his company was to keep them intelligently acquainted with general business conditions in Canada. He said he knew no better paper than THE POST for the purpose. It would seem that his men have responded fully to effort made to keep them well informed about Canadian business affairs—so much so that the management have added 40 other men to the original 10 to receive THE POST.

When Mr. Mutton was with the National Cash Register Company as its Canadian manager, he was the king of all managers in the matter of sales records. In this position he achieved a big reputation built on solid achievements. He learned salesmanship in a school where competition was of the hottest kind, and where the competitors were brilliant men. Giving Mr. Mutton full credit for superior personal qualities and energy of the most ardent kind, it is taking nothing away from him when it is said that not a little of his success was due to his intimate and sympathetic knowledge of the other man's business. And he taught the men associated with him as salesmen to know the point of view and requirements of the men they called on to sell machines to.

As vice-president and general manager of the International Business Machines Company, Mr. Mutton is putting into operation an idea used by him in past days with brilliant results—he is causing his salesmen to know the business and requirements of their prospective customers. To establish points of contact swiftly and surely is one of the open secrets of successful selling.

In the case of **your** solicitations of customers and desired customers, it is excellent strategy to have your salesmen so well informed about business conditions generally, and about the interests of the men they canvass, that they will be able almost instantly to relate their proposals to the interests of the buyer. When a salesman shows himself intimate with the interests or business or objectives of the man whose order he wants, he is immensely strengthened as a salesman, and his percentage of successful canvasses goes steadily up.

Our definite suggestion to you is: Subscribe to THE POST yourself, and learn from its pages how your salesmen or executives can draw power from this newspaper. Then, having acquired the sought-for knowledge, subscribe to THE POST for each man in your service who can profit you by knowing what is in THE POST each week. If Frank Mutton and other prominent executives are making a success of THE POST as a salesman's aid, it is reasonable to suppose that other managers of salesmen and executives can likewise employ THE POST as a producing agent. And so we ask you to sign and forward the coupon below.

The MacLean Publishing Company, Limited,
Dept. S.E., 143-153 University Ave., Toronto.

Send me us THE FINANCIAL POST OF CANADA (weekly). Subscription price of $3 will be remitted on receipt of invoice in the usual way. Have this copy sent to

GALT BRASS CO., LIMITED

GALT, CANADA

For the Plumber—

The period of readjustment after the War, about which so many people are talking, presents to the Sanitary Engineer greater opportunities to develop new business.

During the War many homes have been neglected and the Plumbing particularly has fallen into disrepair. It would be quite conservative to say that at least twenty thousand houses in Canada require new Bathrooms.

Now is the time to get after this business. It's a selling preposition and Bathrooms can, and should be, sold in just the same way as any other commodity.

Prospective customers should be circularized and furnished with new and up-to-date literature, explaining the advantages and benefits of good plumbing, and the householder should understand that there's no room in the house more attractive than a good bathroom, and know that nothing adds greater value to a house as a selling proposition.

The Sanitary Engineer can make this plain to his customer by advertising, by correspondence and by personal talks; and he will find his work much easier if he uses our Booklet showing "Enamelware for the Home," and uses Port Hope Enamelware in his installations.

SANITARY ENGINEER

VOL. XIII. JANUARY 2, 1919 No. 1

Someone Should Be Held Responsible

There Should be Some Interest Taken by the Trade in Such Matters as Are Referred to in This Article—Lives Lost and Ill-health Brought About by Poor Installations

WE HAVE winter with us again, and we have all over the Dominion reports appearing in our newspapers of fatalities as the result of improperly installed heating systems. What is being done to eliminate such fatalities? Absolutely nothing. The heating trade seems to be in a state of coma. No concerted action that we can learn of is being made, and still the jerry builder and cheap-jack holds sway.

Let us review the situation again. though we have taken these matters up very fully and often during the last few years in SANITARY ENGINEER. In the first place the heating of a building has never been regarded as one of real importance. It has almost always been looked upon as a source of expense from first to last; not as a necessity that could be turned into a profitable asset, but rather in the light of a liability. Such being the case, the cutting down of first cost has been and is to-day looked upon as being the most important element in a heating system.

Now, in the first place, what class of men are the most logical and practical to explain to the public the danger in a thousand and one ways of an impractically installed heating system? The heating engineer, of course. And who are doing the least to instruct the public of the dangers that lurk in a home or building in which there is a heating system that is not fully equipped and properly suited for a building? Again we have no alternative but to admit it should be the heating engineer. Why? Because in the main he himself is not a salesman, he is the victim of the sub-contractor, the bulk contractor or the architect on the one hand, or he is often so anxious to procure the heating contract that, instead of tendering on what he knows is absolutely necessary, he merely quotes on the system specified by the class of men mentioned above.

What does all this kind of procedure amount to? or, should we say, what are the results finally? The cheapest impractical appliances are installed. If a warm-air furnace is specified, the whole apparatus very often means no more than a jumble of tin pipes, as light gauge as can be procured, a poor, miserably designed hot box of a stove in a light gauge galvanized casing and as cheap a type of wall register as can be procured.

No real engineering science is embodied in the make-up of the apparatus, no heat-controlling device, no well laid out job, and no thought as to either the heat loss of a building or precautions to ensure that the maximum amount of heat from the fuel burned is procured to really warm the house or building in which the apparatus is installed. In fact here is the state of affairs which exists in Toronto and many other large Canadian cities. Mr. Workingman builds himself a home, or he likely buys some cheap shack. He adds to it as time goes on. He uses stoves to heat this piece-meal home until he becomes convinced that he should have a warm-air furnace installed. He goes to some departmental mail order store and buys whatever is offered to him, perhaps a furnace which looks to him, standing there on the store floor, as if it was big enough to heat a town. He buys it and gets possibly a few instructions (How to install a furnace). Next, he goes to some hardware store and buys so many lengths of tine pipe, a few registers, and there he has all he wants. Little does he know that men are studying the problems of warm air heating and even to-day. with all the scientific thought expended, we venture to say that we have not by any means reached the millennium in any type of heating. Much less warm air heating.

In the city of Toronto any person can procure anything he wants in the shape of plumbing and heating goods and can install them himself, though it is against the law to install plumbing goods without a permit, etc., etc., but it is done because the goods can be procured from irresponsible mail order and department stores and no questions asked. In effect this type of store says: "What care we if these plumbing goods not being properly installed result in generating tuberculosis, pneumonia, influenza, etc., etc. Or, what care we when we sell a furnace, whether a few dozen lives are lost as a result of improperly installed heating appliances. Neither do we care how much fuel is wasted. It's none of our business, we are here to make money. We are in business to sell goods."

In fact, selling such goods under present methods is about on a par with the doctor who prescribes a certain mixture of medicine, and forgets or neglects to state at what intervals the medicine is to be taken. Of course no doctor ever lived who would do such a thing. But that is just what is being done in effect by persons or institutions who sell furnaces, or plumbing goods, and who are not held responsible for the proper installation of these appliances.

JERRY-BUILDING

Defective furnace installation caused the death of a whole family last week. Four persons were asphyxiated by coal gas. It is a wonder that fatalities of this sort are not more frequent. The hot-air system of heating has been made unpopular not because it is intrinsically inefficient, but because the contractors have insisted on low-priced work. Cheapness rather than thoroughness has been the ideal.

The art of speculative building in this city has been developed to a high point. Sheet metal workers have been expected to do a fifty-dollar job for forty dollars. As a result, a good many people are uncomfortable in severe weather, and there are too many fire alarms. If the public health demands a careful inspection of all plumbing installation, with the application of the smoke-test, why should not the city authorities set up a standard for heating installations?

—Toronto Daily News,
Dec. 26, 1918.

Next, there is the bulk and sub-contractor or architect who specifies the size and type of furnace and method of installation. Should these men be held responsible or should the heating engineer? SANITARY ENGINEER does not want to appear too arbitrary in this matter. But we would assert very strongly that the heating engineer should by all means be held responsible. He is the practical man on the job, and he should be the judge. Long after the architect or contractors are forgotten, the name of the heating engineer or the manufacturer of the appliances installed is remembered and commended or condemned according to the merits of the installation.

Who was it improperly installed furnaces in homes owing to which lives have been lost? We refer to any or all. Where is the jury, or was there a proper and practical inquest held in connection with the deaths of all the persons who have lost their lives within the last, say ten years? There should be practical heating engineers on such a jury. Men who could give a proper verdict. Some one should be made responsible. There is honor and service in responsibility, and we heating engineers should wake up and grasp this responsibility. We would then cease to be the tools of every Tom, Dick, and Harry of a contractor or architect. In fact, the influence which, because of our practical knowledge, we could bring to bear upon the public's mind would be enormous if we would only assert ourselves more prominently.

Cause for Alarm

There is a big movement on foot to assist workingmen to build homes for themselves, or to house our returned soldiers. What is going to be the outcome of this scheme if practical heating systems are not installed in these homes? These homes are going to be wasting hundreds of thousands of tons of fuel. These homes are going to be generators of every disease known to humanity, and who pays? The workingman, the soldier and their babies. These homes will be a liability instead of an asset. And particularly so if these homes are erected in the same manner as is being followed by the housing commissions in the United States. But as this is another story, the writer will not dwell on that phase of the housing scheme of America. What SANITARY ENGINEER foresees is, that if impractical men are allowed to plan houses for our returned soldiers, for our workingmen, and there is no jurisdiction over the heating appliances, either as to the way they are installed or their efficiency in consumption of fuel, then, such appliances will be installed (as per usual): first cost only will be the chief factor, and lives will be endangered, the health of the occupants undermined and no one will be responsible.

SECURING POSITIONS FOR SOLDIERS

What the Government is Doing With and For Our Returned Soldiers—How Information is Being Secured—Able Men at the Helm—This Does Not, However, Prevent Every Citizen From Doing His or Her Share

FROM time to time SANITARY ENGINEER has been asked a number of questions re what is being done for our returned men. In this connection a short article appeared in our Dec. 15 issue, but since that date we have received a communication from the Government information bureau regarding the question, and have pleasure in publishing same in full for the benefit of our readers:

HOW DEMOBILIZATION BRANCH OF SOLDIERS' CIVIL RE-ESTABLISHMENT GETS CONTACT WITH RETURNING MEN OVERSEAS

Routine In Canada

The Demobilization Branch of the Departments of Soldiers Civil Re-Establishment is under the direction of Major L. L. Anthes with T. A. Stevenson as assistant. Major Anthes is leading manufacturer and engineering expert and was chosen as representative of manufacturing and technical interests while Mr. Stevenson as secretary of the Toronto Trades and Labor Council was chosen to represent labor interests. The Re-Establishment Department makes its first contact with the Canadian soldier while he is still overseas. Major T. W. Anderson, the overseas representative, who is already in England, is conducting a questionnaire of the members of the C.E.F., the men being required to state their occupation at the time of enlistment, the occupation they wish to follow on their return to Canada, the dispersal area which they have chosen and other necessary detailed information. This information, which will be tabulated at headquarters in Ottawa within a month, is to be used in connection with the survey of industries being conducted by representatives of the Department of Labor. These representatives, who have technical knowledge of the industries which they are assigned to survey, will periodically collect data regarding positions actually vacant and liable to be vacant.

The man and the job will be connected at the demobilization employment offices which are now being established throughout Canada at every military dispersal centre and in every city of 10,000 population and over.

Under Provincial Control

These offices will be under the control of the Provincial Departments of Labor, but are being organized and co-ordinated by the Dominion Department of Labor. There is a safe and sure system of directing the returned soldier to these employment offices and of seeing to it that he gets preference in employment. The Provincial Returned Soldier Commission whose organizations have been built up on a very extensive scale during the past four years will be charged with the work of befriending the soldier and of directing him to the employment office. At the employment office there will be a representative of the Department of Soldiers' Civil Re-establishment whose duty it will be to look after the soldiers' interest when they arrive at the office. This representative, it is proposed, will make his reports through the Returned Soldiers' Commission to the Department's headquarters in Ottawa. In each unit there will be at unit headquarters a demobilization officer of the Department of Soldiers' Civil Re-establishment who will also be a member of the Returned Soldier Commission, and who will act in an advisory capacity. All of the employees mentioned are to be returned soldiers and it has been promised that as far as possible the men in charge of the demobilization employment offices will also be returned men.

The Department of Soldiers' Civil Re-Establishment is acting in co-operation with the Department of Labor and several other departments of the Government, under the co-ordinating direction of the Repatriation and Employment Committee, which has been established for the purpose of securing the most efficient service and eliminating duplication by Dominion or Provincial departments and organizations, without dispensing with the services and connections that have been established for three years or more and that have done such efficient work.

By Vocational Branch

The return of the disabled soldier to civil life will be accomplished as it has heretofore through the vocational branch of the Department of Soldiers' Civil Re-Establishment. The man so disabled by war that he cannot return to his former employment will be given training in a suitable trade or occupation and will receive vocational pay and allowances.

The medical service continues free: sanatorium, hospital and outpatient treatment. Every man of the Canadian Expeditionary Force honorably discharged is entitled to free treatment for recurrence of war disability as long as he lives. The service of the branch supplying and maintaining artificial limbs and appliances free of charge is also continued. That there is still a large task ahead for these branches is shown by the fact that there are still over 30,000 wounded and disabled men to be returned to Canada, many of whom will require vocational training and still more medical treatment.

A Chat About Cleanouts

No Doubt the Troubles With Cleanouts Are Countless—Every Sanitary Engineer Will Agree With Many Points Taken Up in This Article By the Writer

By a TROUBLES MAN

NEARLY three years ago I had the privilege of addressing the readers of this journal in two small articles on cleanouts, and having had this subject further strongly impressed upon me in various ways since that time I would like to present some further views on this important subject.

Now the object of affixing cleanouts is to permit of the removal of obstructions from the soil, waste and drain pipes without breaking into those conductors, and the cleanouts should be affixed in such a manner that this object can be readily attained.

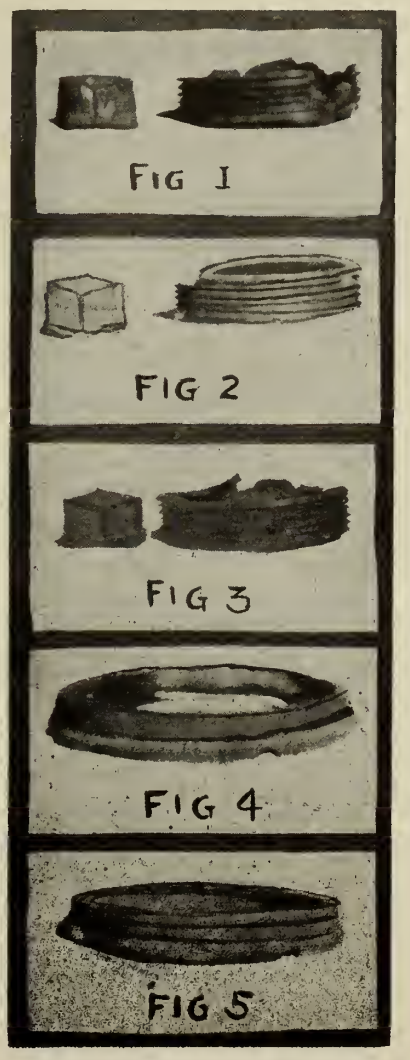
Most plumbing regulations and by-laws require that cleanouts shall be placed at dead ends of waste and drain pipes at each change of direction, and where the house drain enters the premises, also just above the foot of vertical stacks. Some laws state, in addition, that they shall be placed at intervals not exceeding 50, 40 or even 25 feet apart on straight runs of horizontal pipes.

Most regulations insist that "cleanouts shall be constructed in such a way that easy access can be gained to them," yet what do we find? It seems to me that three words are needed to be affixed to the end of that clause, these words being "at all times."

Often when the plumber has fixed a cleanout in what appears at the time of installation to be a suitable accessible location, the mason, the carpenter, or the owner comes along, and puts up a partition wall for, say, a coal bin in the basement, just two inches behind the cleanout of the sink waste, and the plumber may have to break a hole in the wall a foot square to get even a small wrench on the cleanout nut, before he can remove a chokage. Of course, one often meets a cleanout placed so close to a permanent outside wall by the plumber, but they have usually been so put before the institution of plumbing inspection, or under a lax or impractical inspector.

The writer has discovered many cleanouts, some quite recently, that have been concreted over and otherwise covered up. This state of things may have been the plumber's fault through fixing them too low, though it was possibly the building superintendent's error in giving him the floor level, but certainly the floor-layer was at fault in covering them over instead of having them brought up to surface, forming a box, or dishing the floor to take care of them.

The evils of the two latter plans, which make them so undesirable, are that they retain any foul or stale liquid that may and invariably does get into them, and that they get filled up with dust and get lost, causing them often to be covered over by temporary bulky obstructions or permanent partitions, or bricked walls. It would be a good thing if the plumber would leave a note with the building superintendent, or the owner, or both, calling his attention to these things; it would greatly add to the convenience of the occupier of the premises and show an intelligent interest on the part of the plumber in the successful working of his installation. "But," the plumber says, "it's up to the inspector." Perhaps it is, but how many plumbing inspection departments are sufficiently staffed to permit of the inspector tagging all the cleanouts on a job, or of doing anything beyond noting the fixtures and ascertaining the tightness of the work on his two hurried visits of inspection? And so when a chokage occurs the owner has to part with his good dollars to unearth, or what is much more expensive, unconcrete these lost cleanouts.



Then, again, forming boxes in the concrete for cleanouts comes in very unhandy for the man who has to open the cleanout, especially when it has a central nut, as the only wrench that will operate at right angles to the axis is too short to exert the necessary force to induce the glutted threads to part company.

Speaking of glutted threads, the writer has quite a collection of nuts that have been torn off cleanout plugs of a similar pattern to that some time ago adopted by the Winnipeg branch of the C. I. S. E., though he has found many others that have been easy of removal owing to the body having been split by the forcing of the plug into place in the endeavor to achieve the impossible, by making staunch the entry of the continuous thread into another continuous thread.

Still all these troubles fade into significance by comparison with the removing of cleanout plugs from Durham tees and "Y's," etc.

Where the "T Y" finishes the horizontal portion of a sink waste or other waste pipe it is usually put on at the bench; the vise holds the pipe and the plumber has a good chance to screw the plug right home, and he usually does it. A notable case of this kind recurs to me. In a hotel a bar back fixture with a cornice three feet wide was placed beneath it, the top being about a foot below the T. Y. It got choked in the horizontal run and it took a plumber nearly a day to cut that plug out of the tee with a diamond point which was the only tool he could bring to bear on that particular plug after a stillson had chewed off the nut.

It is often necessary to crack the tee or Y to remove these plugs, which do not require many months to rust together, and it is my contention that proper cleanouts for Durham work are badly needed and should in all cases be insisted on if Durham work is to be installed.

Good cleanouts for Durham work are more necessary than for cast iron systems, owing to the greater frequency of chokage.

Fig. 1 is a photograph of a main cleanout plug removed from a flooded basement. The water drained away when the nut tore out. The reader will note the body was not cracked in this case

Continued on page 32.

Building Not Yet Very Active

A Number of Larger Cities Lead in the Building Industry—With the Gradual Steadying Down of War Activities and More Stable Conditions in Labor Circles, the Building Trade Must Come Back to Normal

In spite of declarations that the building industry has experienced a marked revival since the signing of the armistice, very little improvement is indicated by the figures of building permits issued by Canadian cities during November. Thirty-five cities, as exhibited in the table below, reported the issuance of permits to the value of $2,206,282. This compares with $2,049,280 in November, 1917, an increase of $157,002. Of course, the statement that building is reviving is not necessarily incompatible with low permit figures. The reported activity in building doubtless has reference to the preparation of plans, the letting of contracts, etc., and no effect on permits may be expected for a month or two. In fact it may not be until next spring that permits will actually reflect the changed conditions.

Cities That Lead

Toronto takes precedence as the city reporting the largest amount of permits for the month. Its figure was $396,385. Next comes Hamilton with $374,385; then Montreal with $339,475 and Halifax with $326,907. The best showing so far as gain is concerned is made by Halifax, where the increase amounted to $291,699. Hamilton's gain amounted to $220,925, and that of Montreal to $120,120. On the other hand Toronto was behind by $21,734. The poorest showing was made by Quebec, where this year's permits of $69,056 were behind by $426,895. Altogether the 23 eastern cities reporting broke about even with last year, having a gain of only $140,948.

November permits in the West have been very small though apparently not unusually so. Twelve cities reported aggregate permits of $265,579, an increase of about $16,000. Vancouver was in the lead with $70,798, a gain of $35,723. Winnipeg came second with $43,050, a decline of $3,550.

For Eleven Months

As the year approaches its end, it is apparent that on the whole the building situation has enjoyed a substantial improvement. This is clearly indicated by the eleven months' experience. For 35 cities the total has been $35,185,263, which is an increase of $3,771,202. Much of this good showing, it must be admitted, is due to the performance of the Western cities. With the sole exceptions of Brandon and Winnipeg, every important Western city has enjoyed a gain. In the case of Vancouver this gain was as much as $646,771, while in that of Calgary it was $631,400 and in that of Regina, $576,280.

However, the East is also ahead, though not to the same extent. Twenty-three cities show a gain of a million and a half. Most noteworthy, of course, is Halifax, where reconstruction has called for buildings worth $2,783,465, an increase of nearly two millions. Toronto has the largest total, viz., $7,929,880, which represents a gain of well over a million. Ottawa has a gain of $1,531,637, while Quebec is behind by almost a like amount. Montreal with a total of $4,706,828 has an increase of $407,775. Other figures indicate a good deal of variety.

RAISE RESTRICTIONS

To Permit of Erection of Three-Family Apartment Houses

Toronto's Board of Control has recommended to the city council that the residential restrictions in the district between Parliament and Bathurst streets, south of Carlton and College Streets, be relaxed to permit the erection of three-family apartment houses and the conversion of existing buildings into three-family apartments.

This proposal made originally by Controller O'Neill was debated in council some months ago and left in abeyance pending the report of the Housing Commission, which was tabled at the last meeting of council. The Controller again moved his resolution, which was to include the central area as far north as Bloor Street.

Building Permits for the Month of November

	Nov., 1918	Nov., 1917	Change	11 mos., 1918	11 mos., 1917	Change

Sanitary Engineers to Prevent Disease

The Part They Play—Greater Portion of Diseases Are Preventable—Engineers Could Eliminate Many, if Consulted and Their Advice Followed—Cleanliness, the Greatest Disease Preventive, is Mostly a Matter of Sanitary Engineering

By a Sanitary Engineer

IN looking for the causes of the present epidemic of influenza the sanitary condition of the country should be considered in relation to the prevalence of sickness. If the situation is regarded as a whole, it will be seen, first, that all constructional works for sewerage and water supply were stopped at the beginning of the war; next, that the medical officers, district engineers, and in fact all workers connected with the maintenance of the sanitary condition of the country were drawn upon in very large numbers for military service; and, third, that material of all kinds necessary for maintenance became more and more difficult to obtain. Thus, even if other things had remained normal, those who had the control of works upon which the maintenance of proper health conditions depends were severely handicapped.

This, however, was only the beginning of the trouble. Large camps and munition works were hurriedly established all over the country, and working conditions in towns and villages were entirely upset by an unexpected increase in the population through the presence of bodies of troops and other causes. Even if the Government Department had consulted the best sanitary engineers it would have been a most difficult matter to prevent the setting up of insanitary conditions; but it is a matter of common knowledge that a great deal of work has been badly done, and that, speaking generally, very little use has been made by the Government of the services of engineers. The American Government, as soon as they came into the war, retained the services of the very best civil engineers to look after the sanitation of their cantonments, with the good results which were to have been expected. Other factors that have tended to lower the sanitary condition of the country as a whole have been the presence of many thousands of prisoners and foreign refugees, the erection of a great number of establishments, large and small, at some of which the insanitary conditions are absolutely vile, and the crowding of villages and towns with sick and wounded from the war. If there is any truth in the idea that disease may be produced by insanitary conditions, the marvel is that we have hitherto escaped an epidemic infinitely worse than the present visitation.

Need For Expert Advice

If cleanliness is a preventive of disease, the sanitary engineer should have much more to do at present than is commonly supposed. Books are published which suggest to the layman that he may become his own lawyer, but it is quite unnecessary for anyone to write a book with the title "Every man his own engineer," because upon that subject most men esteem themselves fully qualified to express an opinion and sometimes actually to carry out work. Thus, if the water supply or sewerage of a district is in question, it is by no means certain, apart from places possessing a competent engineer with sufficient time for his work, that anyone possessing really expert knowledge will be called upon to deal with the matter; and, further, it is practically certain in the majority of cases that the work having once been installed will receive no expert attention at all; that is to say, expert attention in the true meaning of the word. Sewers which were designed to suit particular conditions are used for an indefinite period until they become quite insufficient for the needs of the place, and during this time all sorts of unqualifed persons are allowed to connect their drains with a very limited amount of supervision on the part of the local authority. The result is that a good sewer is frequently ruined, large quantities of land water are allowed to enter the system through leaking joints in such connections, and, in short, the original design of the engineer is entirely spoiled. Sewage disposal works in particular are often worked beyond their power, having been put in to serve a much smaller population.

Importance of Maintenance

Conditions of this kind exist in a large number of cases, but are by no means the worst part of the trouble, and probably not the chief cause of ill-health. There can be no doubt that the ordinary condition of the drainage of houses, of the soil and waste pipes and of sanitary fittings is extremely bad, especially with regard to their maintenance. The writer during the past 25 years has inspected a very large number of buildings of various kinds, houses, business establishments, hospitals, works, and so forth, and has generally found that even where the systems are well designed and well constructed very insanitary conditions have been set up owing to ignorance and neglect of proper cleaning. In many cases although the drains may be sound they are not kept clean. The interceptors are frequently found to be blocked, wholly or partially, causing the drains to stand full of sewage, which escapes at any leak instead of flowing into the sewer; the ventilation pipes from the drains often terminate close to the tops of chimneys, whence the bad air may be drawn by a down draught into the houses; the fittings are not properly cleaned; baths and basins, though properly trapped, nevertheless have overflow pipes which are so foul that they produce dangerous smells. The importance of trapping the waste pipe of a sink was realized long ago, and if the sink is trapped the average person looks upon the whole matter as settled. But attached to many sinks will be found an overflow pipe, ventilating freely into the house and coated with decaying soap or grease, the smell from which may be quite as dangerous as that from a waste pipe, and similar results may be produced by accumulations of grease under lead or woodwork round a sink or under draining boards. It is scarcely too much to say that there are few places where, owing to ignorance of the need for scrupulous cleanliness and proper maintenance, insanitary conditions are not set up inside ordinary houses.

Attention to Details

Defects of this kind have no doubt a great effect on the health of the community at large. An instance of the result of scrupulous cleanliness and scientific maintenance of the drainage system of certain London business premises was given recently, and the consequent prevention of influenza was noted. Further, the health generally during the past four years has been very good, although formerly, before the present changes were made, there were many cases of sickness. It is reasonable to suppose, therefore, that the management of the business in question have actually reaped a considerable financial benefit by adopting the unusual course of having expert advice upon what would ordinarily be regarded as a purely domestic matter, in fact a matter really beneath the notice of the heads of the establishment, and one to be dealt with by servants and cleaners. It is certain that the latter, even with the best intentions, would miss many important points, and even an experienced builder or plumber, being quite unused to the high standard of cleanliness enforced, would be unlikely to give proper directions.

If attention to small details within the house can give such influence on health as is indicated by this example, there are numbers of points of still greater importance in connection with sanitary engineering and water supply taken as a whole. Who can say, for instance, what harm is done by the mil-

lions of flies which congregate on a sludge heap at the sewage disposal works or on the filters? Who can say what harm is done by an occasional back-flow of sewage into a cellar in a building which is apparently well drained, such a back-flow never being discovered by those who are living in the rooms above? Who can say what harm is done by a sewer leaking near a water main which possesses an unsound joint or pipe. Water mains are sometimes empty, a vacuum is formed, sewage standing in the ground may be drawn in, and the purest of waters may be thus contaminated without detection.

Factors Adverse to Good Work

Sanitary engineering is not yet regarded in its proper light, and even the best sanitary engineers hesitate to produce the perfect scheme they know to be possible or to suggest the amount of expert attention required, knowing full well that the cost of such work is always cut down to the irreducible minimum. The work is not seen, and therefore it is practically impossible to obtain the money needed to do it in the best possible way. While it is undesirable to spend money unnecessarily, while extravagance in municipal works is a thing to be avoided, the great importance of sanitary engineering ought to be brought prominently forward, and the position of the sanitary engineer, that is to say of the properly qualified engineer who has made sanitary engineering his life work, ought to be understood as clearly as the position of the medical specialist. The Institution of Sanitary Engineers was founded with this object and has already done much good work, but the public needs to be educated upon this point, which is certainly vital to the health of the nation. Engineers are as much in need of enlightenment as the general public, for it is by no means unknown for a man who is an expert on some other subject to think that he can very easily deal with what is, in his opinion, such a simple matter as drainage, little grasping the fact that it is one of the most complicated and difficult branches of engineering.

Value For Money

The idea that money may be wasted upon water works and upon drainage and sanitary work is quite sound; not only may it be wasted, but very frequently is wasted, because work put in by an incompetent person is generally not only ineffective but also wasteful. Where, however, good work and proper supervision will prevent disease their value to the community can be proved in pounds, shillings and pence.

We have reached a certain stage of efficiency with regard to sanitary matters in this country. Things are very much better than they were a hundred years ago, and people are ready to imagine that we have reached finality. This is not the case. Sanitary engineering is in exactly the same condition as preventive medicine; an enormous amount of work yet remains to be done, and is well worth doing. If the expense caused, say, by one case of typhoid fever which does not end fatally is considered, together with the amount of energy absorbed in those who have to deal with such a case, the value of its prevention becomes apparent and may actually be to some extent estimated in money; but the cost of cases which terminate fatally cannot possibly be estimated. If those who oppose sanitary reform would consider the possibility of the prevention of illness or death in their own circle or family and would grasp the fact that good sanitary enginering actually does prevent disease, their opposition would surely be silenced. This is not special pleading for the carrying out of any work that is not strictly and absolutely necessary in the public welfare; any work which can be shown to be unnecessary should certainly not be undertaken. On the other hand, it is special pleading that the matter should receive the closest consideration of those who are best qualified to judge. Medical and scientific criticism will be welcomed by the sanitary engineer, because it is merely for lack of such attention that he has hitherto in some degree failed to make good his position and to carry out the best possible work.

HOW ONE FIRM MAINTAINED BIG STAFF IN WAR YEARS

It is a relief to have heard one plumber and steamfitter say, within the past few days, that as far as his firm was concerned they had no complaint to make of the volume of business which they had been able to secure during the period of the war. In fact they had kept their staff of some ninety men going all the time, and in doing this they reached out for all the business they were able to execute. It was refreshing indeed when SANITARY ENGINEER asked a question as to the outlook for the trade in one of the largest cities of the Dominion to receive the answer that business had been good all along. It was, indeed, an unusual reply.

How It Was Done

That this statement could be made was the result of the mangement. The owner had a big staff. They had to keep busy if progress was to be maintained. Wages were gradually advancing. Competition was keen. Better offers were likely to reach the men from various sources; the returns to be had from munition making and the like, and from the big railway companies and so on being very tempting at times. But this firm was on the job and went after trade with a will. That it paid them well to do things on a big scale goes without saying.

"We handle contracts not only in the city but we go outside also. Towns and cities many miles away have furnished us with work and our men have worked east and west of Montreal. Much of the work has been done for large institutions, and this has meant the execution of big contracts for various public and private blocks.

A Careful Plan This

"One of the plans we follow is that of going to the man who has asked us to figure on his work or who may already have given us a contract, and explaining to him carefully and fully just how we will undertake the work. In doing this we give him good reasons and full explanations as to why we propose to do the work in a certain way. It is our business to have a clear and definite plan before the work is started. To explain this to the owner is a wise thing and prevents misunderstandings later. Once an agreement is made the work is started and there are few delays, because the men know well ahead of time just what they shall be required to do. That this has proven to be a good thing goes without saying. It saves time and therefore it saves money and pleases the man for whom we are working."

Why Not You Too?

Organization, directness and eternal vigilance coupled with hard work have made many a small firm a larger one. It is very safe to say that more of the big firms of to-day have had small and humble beginnings than those which have been launched with large sums of ready cash to maintain them. Yea, a great lot of them.

It is mighty important that the small plumber and steamfitter of to-day do the little job well. It is equally important that he take the opportunity that awaits him and make the most of it. To become well-known as a thorough-going mechanic is something which is within the reach of every well-meaning plumber or steamfiter. Slipshod methods have not worked before the war and they will not work now. It's pretty much up to the mechanic to make his customers and his prospective customers sit up and take notice. If he do the small job well to-day, he is just fitting himself the better for the larger contract work of to-morrow. First knowledge and then a determined desire to succeed, coupled with faith in oneself will take you through the difficult paths and land you among the big ones.

The time is upon us when competition will again increase. The same old story, however, "the survival of the fittest," will again repeat itself. Can you plan this way and build to become a big one?

VOL. XIII. JANUARY 2, 1919 No. 1

SANITARY ENGINEERS AND DISEASE PREVENTION

ON another page there appears an article under the above heading, and we desire to call our readers' attention to it, particularly as it deals with a subject of importance to every sanitary and heating engineer.

The writer of the article draws out some splendid arguments in favor of competency in sanitary engineering construction, competency of those men engaged in the profession of sanitary engineers.

He also points out in very emphatic language that sanitary engineers are a body of men engaged in a disease-preventing occupation. He points out the responsibility, too, of the sanitary engineer. In essence he condemns the present style of overflows. In this regard he says:—"Often fittings are not properly cleaned; baths and basins, though properly trapped, nevertheless have overflow pipes which are so foul that they produce dangerous smells. The importance of trapping the waste pipes of a sink was realized long ago, and if the sink is trapped, the average person looks upon the whole matter as settled. But attached to many fixtures will be found an overflow pipe ventilating freely into the house and coated with decaying soap or grease, the smell from which may be quite as dangerous as that from a waste pipe."

There is much to be said in condemnation of the overflow—it is an abortion and by no means should we sanitary engineers allow it to be used. In fact, the day when members of our craft took upon themselves the title of Sanitary Engineers made it imperative that they eliminate every style or type of fixture that could not be properly kept clean, or that contained any cavities to which refuse could adhere.

In connection with leaking pipes, the writer of the article mentioned takes great exception to the way an irresponsible person is in many districts allowed to make house drain connections to a public sewer. We might state that this article comes from England and contains quite a number of items of conditions that prevail on this continent. We will publish an article in next issue along the same lines showing how the American War Trade Board not only ignored all semblance of sanitary construction, but practically told the sanitary engineering profession to forget all about sanitation.

A BIG ISSUE COMING

THERE are so many questions of special interest just now in connection with the reorganization or reconstruction period, or whatever we may term it, that SANITARY ENGINEER feels justified in getting out a big issue. This will be published on Jan. 15, 1919. There will appear in that issue many specially compiled articles, all of which will have a bearing upon the work which must be undertaken by every Canadian citizen, each in his own sphere of occupation.

The questions of most interest to sanitary engineers should be, the housing scheme standardization of material, and a uniform plumbing by-law. There should also be a heating by-law put into force before all the buildings that are required to be erected are finished. A week or two ago four lives were lost as a direct result,, we are told, of a poorly installed furnace. Almost every Canadian city has had its victims from such causes and still there is nothing done. This matter will receive special mention in our big issue.

The question of irresponsible persons selling plumbing goods to be installed by impractical persons will be discussed. SANITARY ENGINEER is of the opinion that the time is ripe when the trade should take a firm stand in this matter. We believe that more preventable diseases are generated by water pollution, air pollution, etc., as a direct result of persons who presume to be able and capable of doing such work as installing plumbing and heating in their houses.

We would also say that a copy of this big issue will be mailed to every sanitary engineer in Canada, whether he is a subscriber or not, so that no member in the trade can say that he has not seen a copy, and if any of our present subscribers know of any public men who are interested in some of the problems discussed in that issue, we sincerely hope that they will bring these articles to their attention

Standardizing Plumbing Codes

Never Was the Time More Opportune Than Now—The Trade Must Wake Up and be Heard by Our Dominion Legislators—Standardization and Elimination of Needless Fittings and Fixtures Must Come

By C. W. PRESDEE

IN order to fully realize the importance of plumbing, that is, the introduction of good water and the removal of body wastes, we have but to recall the costly experience, in truth the catastrophe resulting in stupendous loss of life among our soldiers during the war of 1898, which loss was due to the lack of plumbing in the camps. One historical report of the death rate existing during past wars, states: "In the Spanish-American War, only 183 Americans were killed in battle, and 1,137 wounded, but there were 4,000 cases of typhoid, more than 10 per cent. of them fatal." In other words, more of our soldiers were killed and maimed through the disregard of sanitation than were killed or injured by the enemies' bullets. No such condition will occur now since all of the cantonment buildings both here and abroad are equipped with plumbing.

In the light of modern health conservation, the plumbing code of every municipality is given the same relative attention and is accorded the same prime importance as the factors that make for a progressive city. Very often the supervision and inspection of plumbing and house drainage installations have been extremely lax or left entirely to chance, it being necessary to only conform to a few minor regulations. This is due perhaps to the common and serious mistake of not realizing the menace to health which the lack of adequate sanitation brings into existence.

A building department would not grant a permit for an office building to be constructed of boxwood, nor should a plumbing code permit plumbing and drainage installations that are insanitary. The dangers are even greater in the latter case, for although a building so constructed is a fire trap and may burn with considerable loss to life or property, yet the insidious effect of living without proper sanitary appliances may cause a widespread epidemic throughout a whole city or community and thus create untold suffering and death. For this reason a great deal of importance must be placed upon the necessity of eliminating sewage and sewer gases, which dangerous conditions in modern city life are even of far greater importance than when existing among those who follow a free and out-of-doors life, such as our soldiers in camp.

Besides proper regard to the sanitary effectiveness of the finished plumbing, the kinds of materials used as waste piping are of great importance. Too many plumbing codes are not accomplishing what they were intended to accomplish because they permit the use of unstandardized and inferior materials. While the majority of plumbing codes regulate the weight and wall thicknesses of piping, yet they bring about a very serious fault by failing to so regulate the weights and dimensions of fittings. Permitting the use of light and frail fittings in connection with heavy piping is bad practice, for a drainage system is no more safe or sanitary than the lightest fittings which enter into its construction. All codes should, therefore, regulate the wall thickness and dimensions of fittings as well as pipe, and no undue duplication of unnecessary fittings should be allowed, but proper standards established.

Another important provision that should be included in all plumbing codes is the insisting upon proper tests which will ensure tight and permanent piping. The manufacturers of plumbing material, the jobbers and the plumbing inspectors all must thoroughly appreciate the great benefits to be derived from adopting uniform standards for sanitary plumbing installations. This widespread interest must be extended so that the layman shall as fully appreciate the necessities for federal and nationwide uniform practice in plumbing installation. Widespread publicity at this time will accomplish a great benefit in advancing sanitation.

To the officials of all cities it is of vital interest that every reasonable precaution be taken not only to eliminate unsanitary conditions surrounding our people, but the prevailing causes of health menace must likewise be prevented by insisting upon the proper installing of plumbing and house drainage which does not break down after a few months or years of service.

Leaky soil pipe may exist in a building during its whole life. It is therefore quite as important that soil pipe and fittings should be even more rigidly controlled in sanitary and building codes than is now the case with gas or water pipe or structural steel. There should be some regular periodical testing and inspecting of plumbing. Architects and owners rely entirely upon building and plumbing codes. A slight examination of actual conditions as they are to-day, even in some of the largest cities, will indicate that neither the building codes nor the city inspectors give full and adequate protection. Many codes must be revised and brought up to modern standards.

It is paramount, and especially so during these days of supreme national crisis, that every city official who has the best interests, the welfare, comfort, and health of the people and the nation at heart shall get behind this movement of progressive health officials, the engineers and manufacturers who propose to continue the unification and standardization of plumbing regulations on a nation-wide scale.

This illustrates the very common condition existing throughout sewered communities where the plumbing code does not insist upon proper house connections. Both sewers and plumbing are rendered ineffective; streets and lawns are torn up and home owners subjected to needless expense through lack of standardization of plumbing code.

What a Farmer Thinks About Plumbing

A Field Almost Untouched as Yet by Sanitary Engineers—Many Farmers Are Likely to Take Advantage of the Proposed Building Scheme—No House in Town or Country Should Be Built Without Plumbing

SOME of the suggestions made by well-meaning persons regarding the way Government money should be loaned to individuals with which to build houses are as follows: Money should be loaned to persons only who own a lot on which to build homes. Others suggest that farmers owning land should build houses for their hired help. While some go so far as to suggest that the Government should build a good house, completely fitted up with plumbing and a water supply, for every person taking up farm land, and then contend that if such a plan was adopted, Canada would procure the very cream of emigrants from all parts of the world, instead of persons taking up Canadian land, just merely fulfilling the bare conditions of the law so as to get their patent, for purely speculative purposes, and so on.

All these suggestions will no doubt bear fruit. The writer believes, however, that the farmer has as yet not been really sold as regards the full equipment of his home and outhouses with plumbing and heating appliances.

The following article from the Toronto *Globe* is an expression from the other side of the fence. The writer of the article will be remembered by those members of the Canadian Society of Domestic Sanitary Engineers who were in attendance at the convention held in London in 1916.

THE WATER SUPPLY

By Peter McArthur.

While in the city some time ago a friend complained of certain shortcomings of the farming community, and as I was unprepared for the attack I was forced to take it lying down. There was truth in everything he said, and I could not explain on the spur of the moment. He charged that the farms are scandalously lacking in such common city accommodations as running water in the house, bathtubs, and proper sanitary accommodations. I had to admit it with regret, and was inclined to agree with his assertion that it was all due to a lack of proper education along these lines. It was not until I got home and began to attend to the chores that I realized the real cause of the trouble. One of the first chores I had to attend to was to haul home some water from a neighbor's artesian well for use in the house. Our well went dry some weeks ago, like every other ordinary well in the district. While there is water in the ponds and drains that will do for the stock, the house wells have not been filled by the ordinary rains we have had. Only those who have artesian wells are properly supplied. It so happened that when hauling home the water I remembered my friend's criticisms and at once realized why we are so backward. All these improvements require an unfailing water supply, and that is something we have not got. I saw at once that his criticisms also apply to all the towns and villages where they have no public waterworks system. If he had investigated he would have found the conditions complained of among the farmers prevailing among a large section of the urban population. It all depends on the water supply.

—

I am not writing this in defense of existing conditions, but with a view to finding how the difficulty may be overcome. The past few seasons have been so dry that it is becoming evident that we must do something to overcome the scarcity of water. In this district artesian water can usually be secured at a depth of from one hundred and twenty-five to one hundred and fifty feet. But the quality of the supply is uncertain. Not more than half of the wells bored yield water that is fit for use. It is often so heavily mineralized that it will not do for either human beings or live stock. I know of cases where wells within a short distance of one another differ entirely as to the quality of the water. This makes the business of boring for water so uncertain that people do not go to the expense unless absolutely compelled. It usually costs from three hundred to five hundred dollars to get a good artesian well, and farmers often spend that much without getting water that they can use. The consequence is that few of them undertake the work unless compelled to by necessity. But the disappearance of the forests and the drainage of all swamps are drying up the sources of most of the springs and surface wells, so that boring for water must be undertaken much more generally. We cannot get along without water. And when a plentiful supply has been secured there is no good reason why the improvements suggested by my friend should not be made. Those who feel that they must get artesian water in the near future should bear in mind the need of these improvements when making their calculations. It is quite true that there are farms where they have running water in the stable for the use of the live stock while the same advantages have not been provided in the house. This is probably due to the fact that the matter has not been given proper consideration. In such cases it will usually be found that the house is supplied from a surface well that has served from pioneer days. Certainly, when a proper supply of water has been secured, water that can be pumped up to the required height by a windmill or an engine, there is no good excuse to offer for not having the house equipped with modern appliances and improvements. It will mean a considerable outlay of a kind that has not yet become customary in the country, but that difficulty can easily be overcome. A proper water supply, with the improvements it will make possible, can be put in for less than it costs to get an automobile, and it will give the farm dwellers much more comfort. Farmers have learned to use automobiles and to regard the expenditure as quite legitimate. But they can use an automobile only during the season of good roads, while the water supply can be made to serve their needs and comforts throughout the year. In fact, it is in the bad weather that it will prove of the greatest advantage. The matter is certainly one that deserves careful consideration and is one that should be planned for. Now that it is becoming imperative that many wells shall be bored to secure needed water this improvement should be followed by installing modern conveniences in the farm homes. But there is also need that the towns and villages should make improvements along the same lines. Now that the question of public health is receiving the attention of Governments, we should have propaganda on the subject.

It will be seen that there is a lot of good food for thought in the above. The farmer needs the practical help and advice of the sanitary and heating engineer. He can be persuaded to buy automobiles, why not plumbing? He will even go so far as to spend $500 and more in search of a good water supply, and we venture to say that right at this very moment there are hundreds of wells that were the very best source of water supply until a cesspool was placed in their vicinity and thus the wells became polluted.

There are scores of small creeks and streams that are polluted because a septic tank and sewage disposal bed was not installed to properly take care of the sewage and domestic wastes from a plumbing system.

It can therefore be seen that not only can sanitary plumbing be sold to the average farmer, but he should be advised regarding his sewage disposal.

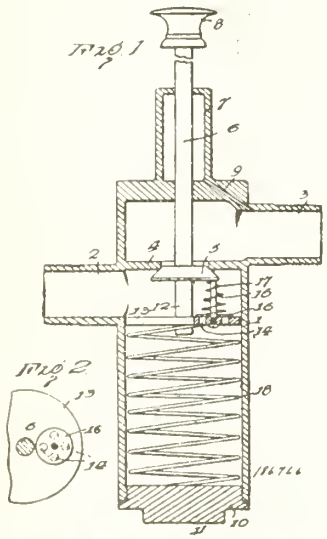
The Ontario Agricultural College is doing a great work in this connection. The writer visited this college some time ago and was astounded at the information provided for and at the disposal of the farmers of Ontario. This good work regarding sewage disposal systems for rural homes can easily be linked with an aggressive sales policy conducted by sanitary and heating engineers.

New Canadian Patents

No. 186,746

Michael J. Neary, Victoria, and Frank Greenshields, Nanaimo, assignee of a half interest, both in British Columbia, Canada, 24th September, 1918; 6 years. Filed 20th August, 1917. Receipt No. 283,478.

Claim.—In a flushing valve, a casing inlet and outlet ports formed therein, a supplemental chamber formed upon the top of said casing and having an inclined way communicating therewith and with the outlet port, said way being arranged at an angle acute to the direction of travel of water through the outlet port, a valve seat formed in the casing, a valve engageable with said seat, a valve rod passing through the valve and upwardly through the casing and supplemental chamber, a piston carried upon the lower end of the valve rod and receivable in the lower portion of said casing, a check valve arranged on the piston and an expansible coiled spring



186,746. Flushing-Valve.

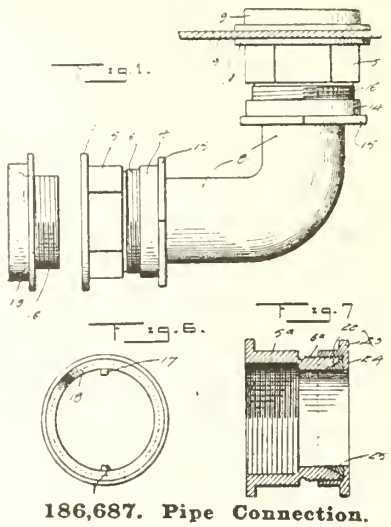
arranged in the lower portion of the valve engageable with said piston for facilitating reseating of the valve.

No. 186,687

Harry Hough, Highland Park, Michigan, U.S.A., 24th September, 1918; 6 years. Filed 15th November, 1917. Receipt No. 287,688.

Claim.—1. A pipe connection including a nut having internal screw threads, a pipe fitted in one end of the nut, an object engaging flange formed upon the nut, a sleeve fitted in the threaded terminal of the nut having a flared outer terminal, and a circular object engaging gasket confined between the flanged terminal of the nut and the flared terminal of the sleeve.

2. A pipe connection including an internally threaded nut, a pipe fitted in one end of the nut, means for securing said pipe in said nut, an object engaging flange carried by the terminal of the nut



186,687. Pipe Connection.

opposite the pipe, an internally ribbed sleeve fitted in the threaded terminal of the nut and provided with a flared outer terminal, and a circular object engaging gasket confined between the flared terminal of the sleeve and the flanged terminal of the nut.

3. A pipe connection including a main nut provided at one end with an object engaging flange and in its opposite end with a recess, the flanged end of the nut having internal screw threads and the recessed end having external screw threads, a pipe fitting in the recessed end of the nut, a gasket in said recess, a ring mounted on said recessed end and having a flange engaging said gasket, an externally threaded sleeve fitting in the flanged end of the main nut and having its outer terminal flared, a circular object engaging gasket engaging said flared terminal and ribs formed on the inner side of said sleeve.

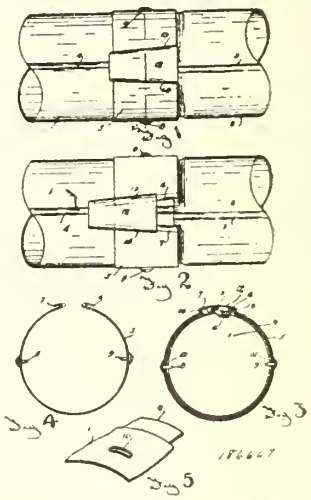
No. 186,647

Johan Walfrid Ostman, assignor, Robert Hampton, both of Winnipeg, and Gottfrid Dahlquist, Transcona, each an assignee of a fourth interest, all in Manitoba, Canada, 17th September, 1918; 6 years. Filed 9th April, 1918. Receipt No. 293,376.

Claim.—1. The combination with a pair of pipes having their ends telescoping one within the other and with the telescoping ends of the pipes provided with registering slots, of a band passing partially around the telescoped ends of the pipes, a fastener for drawing up and holding the ends of the band together, and studs extending from the band and into the registering slots.

2. As a new article of manufacture, a fastening band for telescoping pipes comprising a band having inwardly extending studs thereon, and with the ends of the band formed to provide converging hooks and a fastener provided with hooked sides adapted to slip over the hooked ends of the band.

3. The combination with a pair of pipes having their ends telescoping one within the other and with the telescoped ends of the pipes provided with registering circumferentially-directed slots, of a band pressing partially around the telescoped ends of the pipe and having the ends thereof cut at an angle and turned back to provide a pair of converging book-shaped catches, studs extending from the band and passing into the registering slots, and a tapering fastener for connecting and drawing up the ends of the band, said fastener being provided with catches designed to engage with the catches of the band.



186,647. Stovepipe Lock.

No. 186,575

Octave Fournier, St. Charles, Quebec, Canada, 17th September, 1918; 6 years. Filed 29th May, 1918. Receipt No. 295,471.

Claim.—1. In a radiator, an outer casing having an upper open end and a closed lower end provided with a central opening, water inlets and outlets in said casing, a removable head or nut adapted to be secured in said upper open end provided with a central hole, an inner tube snugly secured between said removable head and said lower closed end of said casing whereby a continuous vertical air passage is formed substantially as described.

2. In a radiator, an outer casing having an upper open end provided with an internal thread and a closed lower end provided with a central opening, and a

groove provided adjacent said central opening, water inlets and outlets in said casing, a removable threaded head or nut adapted to engage said internal thread in said upper open end of the casing, and provided with an outwardly square lug and a central hole through

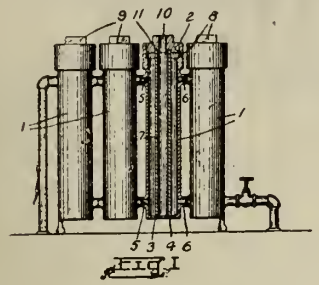


Fig. 1

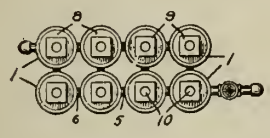

Fig. 2. 186575

No. 186,575. Radiator.

said head and lug, and adjacent said hole on the inner end of said head is provided a groove, an inner tube adapted to fit snugly in said grooves between said head and the closed lower end of said casing whereby a continuous vertical passage is formed, substantially as described.

No. 186,609

Adolord Sigouin, Ste. Agathe des Monts, Quebec, Canada, 17th September, 1918; 6 years. Filed 25th April, 1918. Receipt No. 294,171.

Claim.—In a flushing device for toilets, the combination with a receiving bowl, a tank arranged above said bowl, a flushing pipe forming a means of communication between said tank and said bowl, said flushing pipe having a curved upper end, the inlet end of said flushing

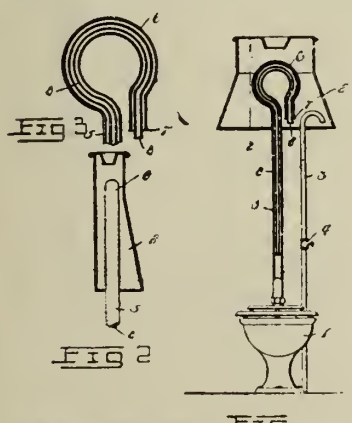

Fig 3 Fig 2

No. 186,609. Fig

Flushing Device for Closets.

pipe terminating adjacent the bottom of said tank, a siphon pipe arranged within said flushing pipe and the inlet end of said siphon pipe projecting beyond the inlet end of said flushing pipe, substantially as and for the purpose specified.

No. 186,506

William H. Shannon, Astoria, Illinois, U.S.A., 10th September, 1918; 6 year. Filed 26th April, 1918. Receipt No. 294,233.

Claim.—1. A ratchet wrench comprising a handle, a wrench head pivoted thereto, said head having a curved channel formed therein concentric with its axis of rotation, ratchet teeth provided on the head outside the channel, a spring for automatically moving the head about its axis in one direction, a toothed pawl for engagement with the ratchet teeth of the head for forcing the latter in the opposite direction, said pawl having an extension terminating in a lug entering the curved channel in the head, and a second spring bearing against the pawl for forcing the said lug against the outer wall of the curved channel to hold the head against movement by the first-named spring.

2. A ratchet wrench comprising a handle having a rotary toothed wrench

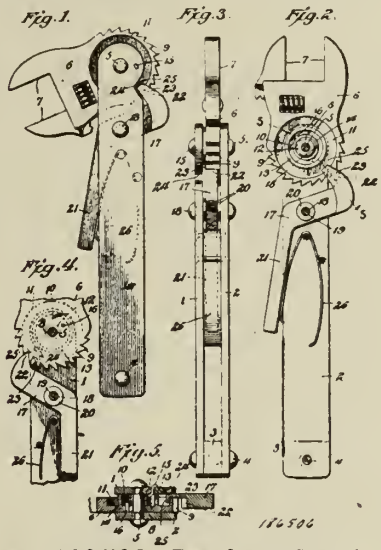

Fig.1. Fig.3. Fig.2. Fig.4. Fig.5. 186506

No. 186,506. Ratchet Wrench.

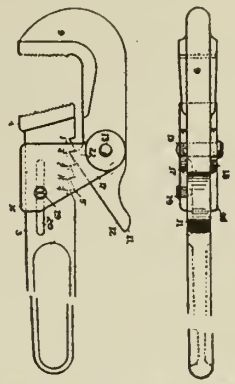
head provided with nut engaging jaws and concentric inner and outer channels formed in one face thereof about its axis of rotation, a coiled spring mounted within the inner channel and having its ends connected to the head and the handle respectively for causing the head to rotate in one direction, an arcuate series of ratchet teeth provided on the head in surrounding relation to the channels, a pawl pivotally mounted in the handle and having a tooth adapted to be manually pressed into engagement with the ratchet teeth, a lug carried by the pawl and adapted to engage against the outer wall of the outer channel in the head, and a second spring stronger than the first-named spring bearing against the pawl for maintaining the lug in such engagement.

3. A ratchet wrench comprising a handle, a wrench head pivoted thereto, a spring for automatically moving the head about its pivot in one direction, said head having ratchet teeth on its exterior, a pawl for engagement with the ratchet teeth, a spring for the pawl having a greater force than the spring for the head, and means provided on the pawl to engage the head when said pawl is out of engagement with the ratchet teeth, said means serving as a friction brake to hold the head against movement by its spring.

No. 186,487

John Reeves, Akron, Ohio, U.S.A., 10th September, 1918; 6 years. Filed 8th March, 1918. Receipt No. 291,909.

Claim.—1. A pipe wrench having a handle provided with a jaw across the end thereof and a series of saw teeth



186,487. Pipe Wrench.

on its inner edge next behind said jaw, a single yoke slidably engaged over said handle and an outer jaw having a shank at right angles to the face of the jaw thereon and pivoted in said yoke, and said shank provided with an extension behind said pivot provided with an inner straight inclined edge, and a single tooth at the inner end of said edge adapted to engage in said series of teeth, and means in said yoke in engagement with said handle adapted to limit the movement of the yoke thereon.

2. A pipe wrench as described having a handle with a fixed jaw across the end thereof and a series of teeth in the edge of said handle next behind said jaw, a yoke engaged over said handle having ears projected outward beyond the edge thereof, and an outer jaw pivoted between said ears and having a straight inclined inner edge provided with a tooth opposite said pivot adapted to engage in said series of teeth and to swing clear of the same for adjustment of the said outer jaw back and forth.

PASSED ON

We regret very much to have to report the death of R. A. Sehl, sanitary and heating engineer of Waterloo, Ontario. The late Mr. Sehl was a member of the Ontario Society of Domestic Sanitary and Heating Engineers. He was a subscriber to SANITARY ENGINEER for many years. He knew his business well, but was one of those fellows always ready and willing to learn more. Appreciating the good work of his trade society, he could always be depended upon to be in attendance at the convention.

PRACTICAL SHEET-METAL WORK

THREE PIECE ELBOW WITH GUSSET OR GORE PIECE.

BY THOMAS STANSFIELD

IN this issue we will take up the development of a round or cylindrical vessel. Before taking up the working out of its parts, it might be best to first take up a few points with regard to the method of figuring out the area and circumference of same.

To find the area of a circle multiply the square of the diameter by .7854.

Take for example a circle of 10 inches diameter. The square of 10 is 10 multiplied by 10, equals 100; .7854 multiplied by 100 equals 78.54, the area of a 10-inch circle.

To find the circumference of a circle multiply the diameter by 3.1416.

For example, take a circle 7 inches in diameter. Multiply 3.1416 by 7, which equals 21.9942 inches.

In common practice the decimal .1416 is not made use of, the faction one-seventh taking its place, thus.

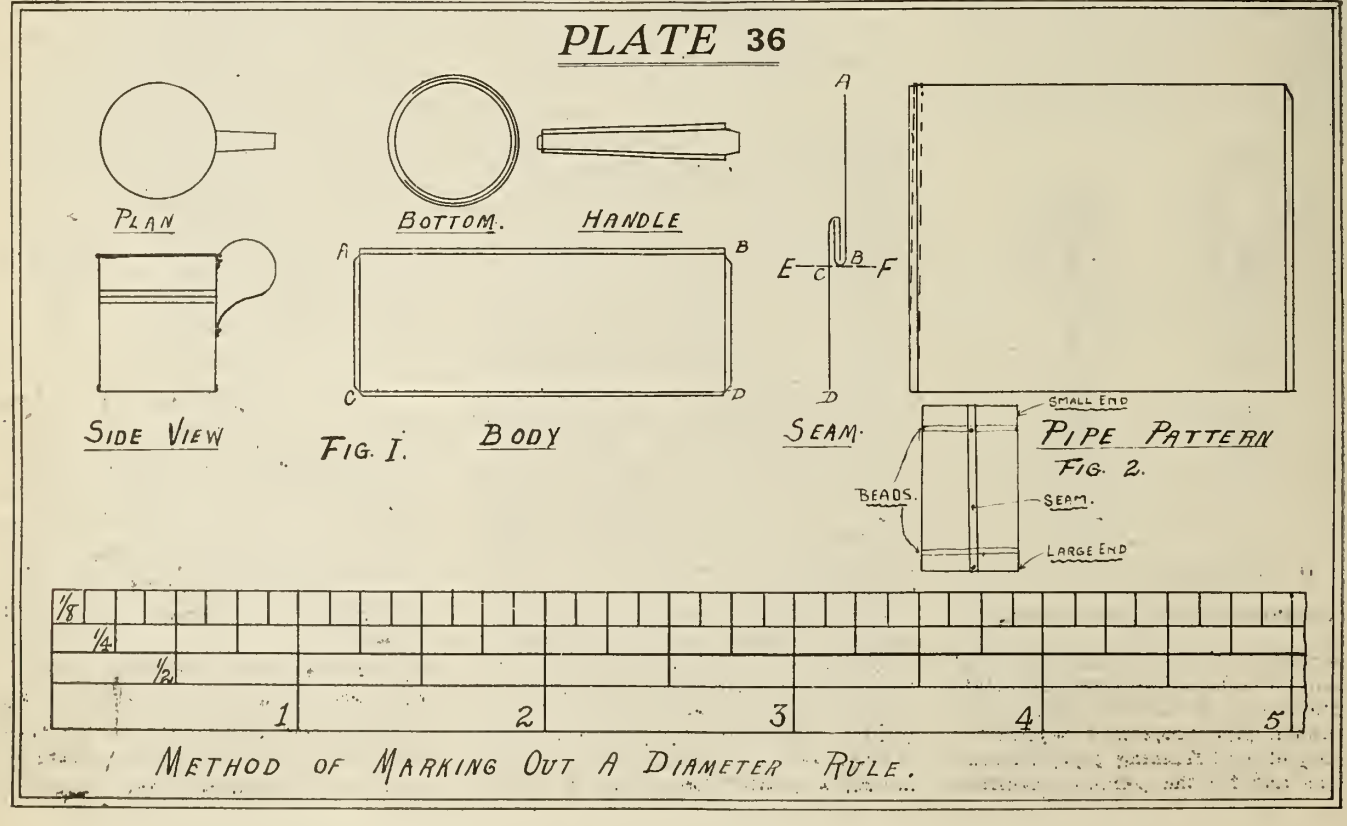
Multiply 7 inches by 3 1-7, which equals 22 inches; thus result compared to the one obtained by using the decimal shows a difference of less than one one-hundredth of one inch.

In dealing with the method of obtaining the circumference, we show an easily made rule. For this purpose it is convenient, and when made of sheet metal can be bent around most any curve, thus saving the necessity of using dividers or compasses. Its construction is simple. Take a two-inch strip of metal, half hard or springy brass preferred, and mark out as near as possible to 3 1/7 inches as many times as the length of rule is to be. Mark these spaces 1-2-3, etc., as shown, to show the circumference for 1-2 and 3, etc., inches diameter. Divide each space into halves, quarters and eighths and mark off as shown.

In Fig. 1 we show the plan and side views of a round tin dipper. With height and diameter given or drawn, first mark out and form up the body of the dipper. To mark out mark off a strip in width equal to height of article, as A-B, and C-D.

At one end, as at A-C, draw a line at right angles to A-B or C-D from A-C mark off, either by spacing with compasses, or by using a rule, the circumference of the article. If the spacing method is used, do not make the spaces too big, as by so doing a small amount of the girth is lost. If done by multiplying the diameter by 3 1-7, it works out pretty near exact, and if a diameter rule is used there is very little chance for a mistake being made. Having marked out the body, next allow the edge required for wiring at top and single edge for double seaming on bottom. The seam allowance is usually placed on each end, thus if a one-quarter inch edge is used, allow three-eighths of an inch on each end. The reason for this is shown at the drawing of a seam, the joint shown is cut at the lock by the line H-E-F, the line A-B above that line and C-D below. Make up the complete line A to D, leaving the three edges over, which

PLATE 36



METHOD OF MARKING OUT A DIAMETER RULE.

have to be allowed as described above. After forming up body, and turning edge to receive bottom, the size of blank to make same is measured for with rule and compasses.

The inner line on bottom shows size of article, the middle or incomplete line the size of edge turned out on bottom of body, and the outer line the size of blank required to seam on to body. The handle is a tapered strip with a wired allowance on both sides, the projection on either end being used to rivet on to body. The length of handle can be got by spacing, or if not marked out, by forming up narrow strip to suit, and then using as pattern for length.

At Fig. 2 is shown a pipe pattern. This needs but a small amount of time, yet quite often pipes do not fit properly. The length of the pipe is usually governed by the width of the sheet. Mark off the circumference to suit diameter required. Then mark off the seam allowances to suit folders, and at one corner mark back on the sheet the amount to be taken off to allow pipe to enter into another, as shown by dotted lines, which then forms seam allowance. In order to readily tell small end it is customary to cut a notch off that corner, and in finally completing the pipe a rivet should be placed at both ends. The small end of the pipe should have the rivet about 2 inches from extreme edge, and at the large end the rivet is placed at the edge. See sketch of pipe, Fig. 2.

(Continued in next issue.)

WILL ELECTRICITY HEAT OUR HOMES SOON

Some Very Interesting Information From Montreal—Further Improvements Being Made

VERY much has been written and much has been said regarding the practicable heating of our homes, our offices, and our large blocks and institutions through the medium of electricity. That it will be an accomplished fact is certainly credited by many. That it is possible to do it to-day from an economic standpoint is less accredited, and still there are seeming evidences of success being attained from this latter viewpoint within a very short space of time.

An Actual System

SANITARY ENGINEER was shown a system in Montreal very recently which is claimed to be the solution of the problem from all practicable viewpoints. Its inventor and patentees are very modest in their claims as to its advantages, its cost of operation, and the practical elimination of any attendant labor. Without making wild and extravagant claims, they are pursuing a course of experimentation with what they state to be undoubted success. Having carried out these experiments for a period of a year or more, and with improvements already made and others contemplated, they state that the heating of homes, business blocks and large hotels and institutions will soon be possible, through the medium of electricity, at a price much less than that now called for with any one of the several fuels in common use. The medium of heating is through voltage and not by the use of amperage.

The Patent Device

While the particulars and construction of the heating unit are essentially secret and patented fully in this country and elsewhere, a rough description can be outlined.

The little thing that does the trick, and which may be likened to a steel-encased rectangular box, contains the "element" or mixture through which the electric energy passes, and from which the water passing on through the radiators of the house or block is delivered at the desired temperature. For, be it understood, the heat may be definitely "fixed" by the operator through the simple application of more or less current. This is regulated by separate switches attached to the little "box" and which, for lack of a better term, may be called the generator-water-jacket. The one seen by SANITARY ENGINEER could not have been more than ten inches square and was so simple as to appear as an unimportant appendix of what was expected to be shown its special representative as a part of the heating unit proper. But there was nothing else, aside from the three switches attached to the service company's "juice," and here in a small space of about three feet in length and a foot diameter each way, or slightly more, was the whole system.

The Connections

Two-inch leads conducted the water from the city service to the electric generator-water-jacket, and the same size of pipe carried the heated water along to the house radiators above. At both top and bottom of the heater unions were placed and heavy gate valves, so that a quick repair might be made or the generator-heater removed within half an hour's time or less. Immediately in front of the hot water lead was placed a thermometer, and the registration could be taken on sight and the heat increased or decreased through the simple operation of one or more of the large switches. So simple did the device appear that one would have been inclined to accept it with some misgivings, were not the heat there, throughout the 24 radiators in the building, and which contained some 400 gallons of water. It was as though one looked upon a fairy scheme.

Cost to Operate

Reports have been issued as to the practicability of heating buildings with electricity, but at least one Government report has discredited the further practicability from an economic standpoint. For the system somewhat rudely described herewith this difficulty is claimed to be dissipated by the patentee and inventor. In substantiation of his claim he stated that this unit had been connected up since the 4th of November. From then to date (December 12) the consumption registered on the city meter above the heater was 1,100 kilowatts, or an average of less than 30 kilowatts per day of 24 hours. The cost, as can be readily figured, would be determined by the prevailing cost per kilowatt hour prevailing in the city, town or village where the plant was installed. Taking a price of one cent per kilowatt hour, the cost of operation for the 38 days in question would run to $11. Within the period in question all weathers had been experienced, and a considerable number of cold, windy days had been experienced.

Last winter, it was stated, a flat of seven average rooms had been heated comfortably at a very reasonable cost.

If this scheme is workable there will be nothing necessary but to turn the switch in the fall, set the automatic control, and let it go till spring.

MAKING THE OFFICE PAY

Above is the title of a new book published by A. W. Shaw Co., Chicago. It contains some of the finest examples of how an office can be made to pay.

The average business man is apt to look upon the cost of an office staff as a source of expense, a direct liability. And this may be the case in many industrial establishments. But a thorough study of this book will show the possessor that an office can be made a very valuable asset to every business. Many of the chapters contain actual experiences of big men, men who have made the office cut out lost motions and obsolete methods in the factory.

There are systems of office mangement from a one-man to a several thousand-man business shown in this book. It contains 23 chapters and nearly 400 pages of real meat.

A postal card to the publishers will procure full particulars.

It is estimated that about 2,000 men could be used in the Porcupine camp. A lumber company last week brought in two hundred men, and the mines are receiving their share.

Market Conditions and Tendencies

Statements Regarding Supplies and Trend of Prices

THE MARKETS AT A GLANCE

MOST of the thrills in the markets are those furnished by ingot metals. Lead has reached lower levels, and with the heavy stocks held in Canada some are of the opinion that even further declines can be expected. Antimony has come down materially, and whereas even lower figures may be reached, no further big drops are anticipated. Spelter has come down, copper is lower, and there seems to be some tendency towards lower prices on aluminum.

The movement towards lower levels in basic iron and steel by United States interests will in time be reflected here, it is thought. Two items which it seems may be affected to a slight extent are wrought iron pipe and soil pipe and fittings. The change is not a very substantial one, but a gradual readjustment to lower levels would seem quite probable during the year just to be ushered in. Supplies of boiler tubes are much better, and a 5 to 10 per cent. decline is mentioned as a possibility early in the new year.

Sheets and plates have held firm and unchanged at levels recently established. The present range of quotations seems to be fairly well in line with figures at the mills, and whereas some slight adjustments may be effected, no material change is contemplated.

Enamelware is firmly held. It is true declines have been recorded in the United States, but these follow recent advances made there which Canadian manufacturers did not follow. The basis ruling to-day is more nearly on a similar footing in the two countries than for some months past.

Contracts for cotton waste are being completed, and these are being filled in "subject to decline." The feeling prevails that a gradually lower scale of quotations will be in evidence, though this must be slow in coming. Restrictions on the use of wool in wool waste have been removed, and former basis for the various grades is being established.

The outlook for business is considered good, and with the opening up of spring the sanitary engineer, plumber and steamfitter should be in for a pronounced increase in business.

TORONTO, December 28.—Probably ingot metals furnish more thrills than any other item in the markets. Lead, tin, spelter and antimony have sagged still further, and conditions generally are such that it is hard to say just what the market is. Boiler tubes are coming along freely and better supplies of wrought pipe are gradually being worked out. The outlook for 1919 to which the trade are now looking is considered very bright.

Unchanged Price On Range Boilers

RANGE BOILERS.—An unchanged range of prices, a gradual improvement in supplies and prospects for good business in 1919 are the conditions ruling as the new year is ushered in. The market is steady.

	Standard	Extra Heavy
10-gallon range boilers....	$14.00	$17.00
15-gallon	17.00	20.50
40-gallon	20.50	24.00
52-gallon	28.00	32.00
60-gallon	37.00	42.00
72-gallon	45.00	50.00
100-gallon	62.00	70.00

Enamelware Steady; Prospects Bright

ENAMELWARE.—A very steady tone is noticeable in the market on enamelware. Declines have occurred in United States manufacturers' prices, but it still will be remembered that when advances occurred some time ago over there, no concerted action to follow this move was undertaken here. The result is that to-day's selling basis is not out of line with prices established following the declines recorded to the South. There may be some slight readjustments effected, and in time a gradual lowering of values in all lines may develop, but the upward move has been slow and the declines will tend to follow a similar slow movement. Manufacturers are looking forward to good business in 1919.

Do., enamel iron or white vitro tank....	29 00

Steady Tone Noted in Soil Pipe

SOIL PIPE. FITTINGS.—A steady tone to the market is reported. Adverse manufacturing conditions as applied to labor are not yet overcome, and the question of securing materials, though better, is not easy as yet. Readjustment of the market in line with changes in basic materials may be expected to come about slowly.

Waste May Be Easier; Oakum

WASTE, OAKUM.—Higher prices on a couple of grades of cotton waste were recorded recently, X going up ½c to 17½c per pound and XX up 1c to 19c per pound. The outlook seems to be that a gradual easing away in prices will take place after the turn of the new year. Contracts are being made "subject to decline" and the trade is looking for somewhat lower levels. The restrictions on wool waste have been lifted. Business on oakum is somewhat quiet just now and prices remain unchanged at levels shown below:

	Per 100 lbs.
Best American	$21 00-$22 00
Clipper, spun	.....- 21 00
Do., unspun	.....- 10 50
Plumbers', spun	10 00- 10 50

Wrought Pipe in Better Supply; May Ease

WROUGHT IRON PIPE.—Better deliveries of raw materials seem to be under way, and whereas these are not marked, a general improvement is looked for with the coming of the new year. Deliveries registered in steel in the United States amounting to $3 to $4 a ton will very likely be reflected here in the price of pipe in time. Business at the present time is very good and prospects for 1919 are considered bright. Conditions under which manufacturers are operating have not eased away appreciably as yet, labor still being scarce.

Tubes Grow Plentiful; Easier

BOILER TUBES.—Indications are that the mills are cleaning up all back orders of Canadian dealers for tubes rapidly, and this means that high priced tubes are being received locally. There has been no price change made as yet on tubes, but it seems possible that the first of the year will bring with it a reduction of 5 to 10 per cent. in present scale of quotations.

BOILER TUBES—	Cold Drawn	Lapweld

3¼ inch	.....	58 00
3½ inch	77 00	60 00
4 inch	90 00	75 00

Prices shown are under revision downward.

Steady Tone in Sheets, Plates

SHEETS, PLATES.—There seems to be a steadier tone to the market on sheets and plates after a period when lower levels have been almost a weekly feature. The feeling seems to be that a pretty substantial basis has been arrived at and no sharp breaks from present levels are thought likely—as a matter of fact it looks as though present range of quotations will carry through pretty well into the first of the year until such time as supplies become quite free.

BLACK SHEETS—	Per 100 lbs.
10 gauge	$....-$7 50-$8 50

Lead Products Hold; Solder Steady

ZINC AND LEAD PRODUCTS.—No new prices have been named on manufactured lead products, quotations shown below being held at unchanged levels. The market on pig lead is easier and even lower levels are anticipated which may work out in declines on the manufactured goods. Solder has held unchanged at declines recently reported. The market is none too firm, lower lead and a situation that is anything but steady in tin providing an easier tendency. Prices are shown below:

Lead pipe, lb.	....	$0 14
Lead waste pipe, lb.	....	0 15
Lead traps and bends	....	Net list
Lead wool, lb.	....	0 14
Lead sheets, 4 to 6 lbs. sq. ft., in rolls, lb.	....	0 12½
Cut sheets ½ to ¾c lb. extra and cut sheets to size, 1c lb. extra.		
Solder, guaranteed, lb.	0 44	0 45
Solder, strictly, lb.	0 41	0 43
Solder, commercial, lb.	0 36½	0 39
Solder, wiping, lb.	0 34	0 45
Solder, wire, lb.	0 49½	0 54
Zinc sheets, per lb.	....	0 26

Market in Old Materials is Dull

OLD MATERIALS.—The market in old materials is dull and there is no buying or selling interest displayed by the trade. Supplies are ample, but there seems to be no encouragement to trading whatever. Quotations shown are on a nominal basis only.

Dealers' Buying Prices		
Tea lead	$0 05¼	$....
Heavy lead pipe	....	0 08
Yellow brass	0 12	0 13
Red brass	....	0 21
Light brass	....	0 09½
Heavy zinc	0 05½	0 06
Heavy copper	0 22	0 23
Stove plate, per ton	....	25 00

Ingot Metals Uncertain; Tin, Lead, Spelter Down

INGOT METALS.—It seems hard to get a definite statement of the market. As a matter of fact some interests state there is no such thing to-day. Lead declined still further in the States last week and tin went up in London. Neither move has directly influenced prices here although lead is lower than in last issue and tin has also reached lower levels.

COPPER.—There is some indication that prices will swing to lower levels. It has already come down somewhat, and this means that it treads on the toes of labor mining it, so whether much lower levels will be possible is a question. Locally there is not any change from the 30-32c per pound level.

TIN.—Higher prices in London exerted no marked influence on the market here. As a matter of fact, lower levels have again been reached in some quarters, prices as low as 75c per pound being quoted and ranging up to 85c. There is practically no movement and supplies are considered ample for limited demand.

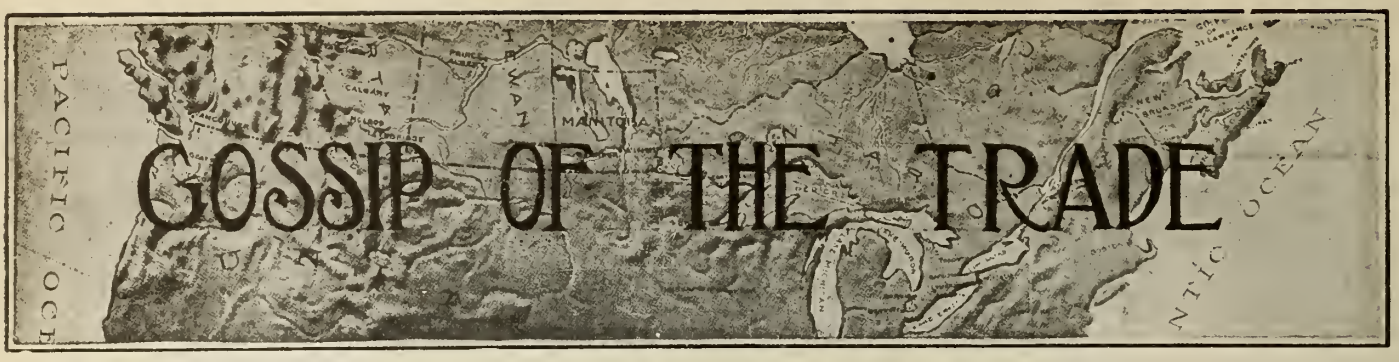
SPELTER.—The local market seems to be quite bare of supplies, but even with this condition some lower figures have been reached as will be shown by the quotations of 9½ to 10c per pound available.

LEAD.—The market has sagged still further in favor of the buyer. This is not a result of the lower levels reached in the United States, but that lower levels will be reached locally seems quite possible. Quotations range to-day from 8¼ to 9½c per pound. Business is limited.

ALUMINUM.—There have been no new or interesting developments here. Nominal quotations range around 50c per pound, but the trade, commercially, has adopted a waiting attitude as far as its future requirements are concerned.

ANTIMONY.—This metal is dull and uninteresting. The marked declines have stopped for a few days at least and any further recessions in value seem likely to come gradually rather than otherwise. Prices to-day are around 10c per pound.

PIG IRON.—A decline of $3 per ton at United States furnaces is reported, but there is still no indication that supplies are plentiful. As a matter of fact it would appear as though pig iron will be scarce for some time to come as demands from all commercial sources will be extremely heavy. There is little new to report in the situation locally, though a gradual improvement in deliveries from the furnaces is expected.



VISITOR IN MONTREAL

E. T. Needham, the worthy representative of the Canadian Wolverine Co., has been calling upon the trade in Montreal. He reports that members in that city are all in a very optimistic spirit, that conditions generally appear to be in a very healthy state, and also that the members of the Montreal Master Plumbers' Association are looking forward to the biggest and most successful convention that has ever been held in the history of the Canadian Society of Domestic Sanitary and Heating Engineers.

EATON PLUMBING DEPARTMENT, WINNIPEG

J. H. Hammond, late of Hammond and Rodway, Winnipeg, has now charge of the plumbing and heating department of the T. Eaton Co., Ltd., Winnipeg, Man.

BACK ON THE JOB

We are pleased to be informed that J. H. McCauley, the superintendent of W. J. McGuire Co., Ltd., Montreal, is back on the job. He has been under the weather for some time and to hear of him again taking the helm is encouraging.

PASSED ON

The many friends in the trade of Eric Selkirk will regret to learn that he passed on to the Great Beyond recently. Mr. Selkirk was one of the firm of Selkirk Brothers, plumbers and steamfitters, Waverley street, Montreal. His death was due to pneumonia. SANITARY ENGINEER joins those members of the craft who were personally acquainted with him in conveying its heartfelt sympathy to those whom he has left to mourn his passing on.

METHODS TO EXTINGUISH FIRES IN BIG COAL PILES

It has long been known that as the result of spontaneous combustion, fires often originate in the interior of coal piles, especially when the coal is fine and contains a large percentage of sulphur. Some recent coal-pile fires have demonstrated, however, that under favorable conditions spontaneous combustion is liable to take place even in piles composed of coal in large lumps. It depends principally upon the nature of the coal and upon the amount of rain to which the pile is exposed.

John A. Thomas, who has made a special study of spontaneous combustion, is the originator of a simple and effective method of extinguishing such coal fires. He uses a strong solution of bicarbonate of soda, which he throws upon the burning coal-pile by means of a force pump. The carbon dioxide, released from the soda, puts out the fire. The gas is assisted by the water which, by the heat of the burning coal, is transformed into steam.

INTERESTING VALVE DATA

As a part of the experimental work conducted in the hydraulic laboratory of the University of Illinois, a number of problems have been investigated. The results of four such problems have been published by the engineering experiment station of the University of Illinois as Bulletin 105.

Part I of the bulletin, "Loss of Hydraulic Head in Small Valves," by Professor Arthur N. Talbot and Fred B. Seely, presents the results of experiments on the flow of water through 1-in. and 2-in. gate valves, 1-in. and 2-in. globe valves, and 1-in. and 2-in. angle valves. In a variety of cases where such valves are used on comparatively short pipe lines as in hydraulic elevator service, in office buildings and in special apparatus, it is important to know the lost head caused by small valves when set at various positions. As very few experimental results have been published on this subject, particularly for globe and angle valves, the data given may be expected to prove useful.

Part II, by Professor Fred B. Seely, presents the results of experiments on submerged sharp-edged orifices of various shapes and sizes discharging under moderately low and under very low heads. Considerable experimenting has heretofore been done on orifices discharged into air, but comparatively few investigations of submerged orifices have been made.

Part III, "Fire Streams from Small Hose and Nozzles," by Professor Virgil R. Fleming, presents the results of experiments on 1½-in. hose and nozzles, both rubber-lined and unlined linen hose being used. These tests were undertaken to acquire data which would aid in computing the quantity of water delivered by a nozzle of the size ordinarily used in the fire protection of the interior of buildings or in computing the pressure necessary in the mains to give an effective fire stream from such nozzles.

Part IV, by Professor Melvin L. Enger, describes the orifice bucket as a means of measuring water and presents experimental data to indicate that the device is reliable for use in engineering practice.

Copies of Bulletin 105, "Hydraulic Experiments with Valves, Orifices, Hose, Nozzles, and Orifice Buckets," may be obtained without charge by addressing the Engineering Experimental Station, University of Illinois, Urbana, Illinois.

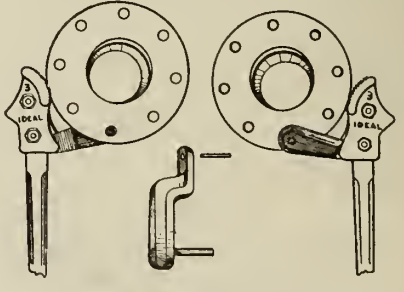
NEW PIPE WRENCH ATTACHMENT

Very few fitters are there that have not experienced trouble in tightening a pipe flange on at close quarters. Therefore it will be good news to most to know that a device has been put on the market to relieve such troubles. See accompanying illustrations:

The Ideal flange attachment is quickly attached to the wrench, in place of the chain, when the tool is to be used as a flange wrench. The special steel flange link is securely held in place by a loose steel pin.

With this device the Ideal wrench insures a grip at two points of contact. In other words, gripping each edge of the flange, there is no chance of slipping, and furthermore, a tremendous leverage can be brought to bear.

The Ideal wrench with flange attachment is also reversible and can be used



on either side of the flange. The use of this attachment permits an exceptionally large range of work, in fact, the capacity of the flange link is even larger than the pipe capacity of the tool.

The Ideal wrench with flange attach-

Master Plumbers Elect Officers

Splendid Meeting Held and Reports Received—A Year of Progress Ahead—Big Increase in Building Activity Likely — Agitation Continued For Representation on Council of Arts and Manufactures

TELESPHORE Latourelle was unanimously elected as president of the Montreal and District Master Plumbers' Association for the year 1919 at the annual meeting held in the Builders' Exchange. President James Griffin occupied the chair and the meeting was characterized by a splendid spirit. The members looked forward to a banner year's activity.

The following list of names was submitted to the meeting as office bearers for the ensuing year by J. E. Walsh, convener of the nominating committee, and this was supported by Secretary John Watson: Past president, James Griffin; president, Telesphore Latourelle; 1st vice-president, W. R. J. Hughes; 2nd vice-president, H. Lavigueur; hon. secretary, John A. Gordon, and secretary, David K. Trotter. The following names also were submitted as chairmen

JNO. WATSON, Montreal

of the various standing committees. Legislation, Arthur Noel; sanitary, James Saunderson; apprentice, O. Daoust; arbitration, D. A. Bethune; price list, George Delaney; audit, Messrs. Belisle, Selkirk and Lepine. Trustees, Messrs Colford, Lalonde and McIntyre. The entire slate was given the unanimous support of the meeting and all were duly declared elected.

By virtue of his occupancy of the presidency, Past President James Griffin will be the Association's accredited representative to the Board of the Montreal Builders' Exchange for 1919.

An Important Discussion

Chairman Alex. Charette brought down a very interesting and important report of an interview which he had arranged with J. L. Decarie, secretary of the Provincial Legislature. This related to the matter of representation which the master plumbers desired, and which they had been striving to obtain upon the Board of Directors of the Council of Arts and Manufactures for the Province of Quebec. It is a big question and far-reaching in that the trade feels that it should know what class of men enter the plumbing trade. Unless it be more closely associated with the above Council of Arts and Manufactures there is little opportunity to discern the standards required by apprentices when they seek employment or when they enter business on their own account.

TELESPHORE LATOURELLE

President-elect of the Montreal and District Master Plumbers' Association. Mr. Latourelle is president of T. Latourelle and Fils, Ltee., Montreal.

JAMES GRIFFIN

Past president of the Montreal and District Master Plumbers' Association. Mr. Griffin has also been selected as the Association's nominee to the Board of the Montreal Builders' Exchange for the year 1919.

While Secretary Decarie had received the committee courteously, Chairman Charette reported that, at the present time, representation could not be granted. This was consequent upon the difficulties which would arise through the necessity of permitting other trades the same representation, for there would be many applications that could not be entertained, not from employers of labor only but as well as from other bodies. Another matter pointed out was that the schools under the direction of the Council of Arts and Manufactures were free, and it was quite impossible therefore to limit the qualifications of those seeking entrance. In view of these facts Mr. Decarie asked that the Masters Plumbers' Association submit a memorandum upon the question to him, suggesting any changes which were deemed to be in the interest of the organization, and which might result in a plan being worked out which would be conformable with the ideas of the Master Plumbers' Association.

H. W. R. HUGHES, Montreal

The wishes of the members of the craft here are that the standards be fair and reasonable, and that those wishing to enter the field as sanitary engineers

shall conform with such standards as are usually recognized in other cities and committees. It is quite unreasonable that the associations would stand idly by and permit every Tom, Dick and Harry to open a shop when and where he liked unless he was qualified by instruction and practical experience to do so.

A Promising Outlook

It is safe to state that the outlook is promising for a progressive season in this district. The craft has been taking advantage of the business that could be secured and with a confident outlook all around for new work to be undertaken within coming months there will be a readiness to buckle into new contracts with a will. To be prepared for this requires early attention to many details, and the convention promised for the early part of the closing summer ought to mean the dawn of a new energy in this part for the plumbing and heating trade. Doubtless the questions to be considered at that time will reveal new and greater opportunities. It is only by anticipating these and by undertaking

L. LEGREW, Toronto

the problems that will arise with a desire to solve them quickly and successfully that the greatest return will be possible.

MEETING OF EXECUTIVE OF CANADIAN D. S. & H. E.

Installation of Officers—Next Convention to be Held in Montreal June 3 and 4

Montreal, December 31st, 1918.

To the Officers and Members of the Canadian Society of Domestic Sanitary and Heating Engineers:

The executive officers of the society submit the following to the Craft throughout Canada, and request each and all to interest themselves in their association, and to send notice of their support to the undersigned.

A meeting of the sub-executive committee was held on the 29th of November, 1918, with the following present: President, Alex. Charette; Secretary-Treasurer, John Watson; Provincial Vice-President for Ontario, Garrett F. Frankland, and Past President James Walsh.

The following offices were declared vacant: Provincial vice-president for Quebec, chairman of heating and ventilation committee, and chairman of apprenticeship committee.

On recommendation of the Montreal association, and the following gentlemen

T. B. SMYTH

being present, they were installed in the above offices: J. Lavigueur as vice-president for Quebec; W. R. J. Hughes, chairman of heating and ventilation committee; P. C. Ogilvie, chairman of apprenticeship committee.

A motion was moved, seconded, and carried unanimously, that we hold our next convention in the City of Montreal, on Tuesday and Wednesday the 3rd and 4th of June, 1919, and that we proceed at once to organize for same.

This convention is being called purely for business in connection with the Canadian society. There is to be no entertainment until the convention is declared closed.

Your sub-executive committee requests that all officers and chairmen of committees settle down to work at once in connection with the coming convention. There has been no convention for two years, the last convention being held in the city of London, Ontario. We are sure the officers elected at the London convention are anxious to submit their reports and other business, or complaints in connection with our profession.

We wish to remind the provincial and local societies and their members that if a change is desired in the by-laws a notice is to be introduced at the convention, and that such a motion must be in the hands of the secretary at least three months before the convention assembles.

We also request that the chairmen of the several committees appoint their additional four members and forward the names to the secretary at once.

We further request that a list of the members of each local or provincial society be forwarded. You will please find enclosed copy of alteration to constitution and by-laws as made at the London convention. Kindly give this your earnest consideration, and if any alteration is required have your motion in our hands as per constitution. By-laws are being printed and will be ready to mail early in January. Forward your name and address at once.

Wishing the craft throughout the Dominion of Canada the compliments of the season,

I remain,
Yours truly,
JOHN WATSON.
Sec.-Treas. C. S. of D. S. and H.E.,
4145 St. Catherine St. W.,
Montreal, P.Q.

Under ByLaw No. 2—Secretary's Duties

In the case of the Annual Meeting he shall, not less than two months before, send to each local society a copy of all resolutions and amendments which are to be considered at that meeting.

By-Law 17a

It shall be the duty of each local or provincial society to forward to the secretary of the Canadian society an annual report which shall state, inter alia, the number of members in good standing, with the name and address of each firm. This report must be in

MUELLER

Compression Sink Bibbs

SIMPLE elegance, combined with superior strength and wearing quality, is what you give your customer when you install **MUELLER** goods.

The many advantageous features of **MUELLER** compression bibbs give maximum service from the bibb as a whole. The anti-spreading device that breaks up the whirling motion of the water and the corrugated stem and handle, allowing the handle to be set at any angle without becoming loose or wobbly, are only two of these features.

MUELLER Bibbs are the best the market affords. Write for prices.

the hands of the secretary of the Canadian society at least sixty days before the Annual Meeting. Each local or provincial society shall forward to the Canadian society the amount of their per capita tax within thirty days of the Annual Meeting. In the event of this amount not being received within fifteen days before the Annual Meeting the Canadian society will make draft for such amount, and the amount will be drawn in accordance with the last returns made by said local or provincial society.

By-Law No. 18

All amendments to the by-laws shall be proposed in writing, and shall be in the hands of the secretary-treasurer at least three months before the first day of the Annual Meeting, and a two-thirds majority shall be required for their adoption, and no amendment to the by-laws shall be considered by the Annual Meeting unless a copy of it has been in the hands of the secretary-treasurer of each local society at least two months before the first day of the meeting at which it is to be considered. Nothing in this article shall prevent a change in the by-laws, provided the same is carried by a two-thirds vote of the members at a regular session.

NEW PIPE WRENCH ATTACHMENT

Continued from page 28.

ment is furnished in the following sizes:

No. 2, capacity ½ in. to 3½ in. pipe.
No. 3, capacity 1 in. to 5 in. pipe.
No. 4, capacity 2 in. to 8 in. pipe.
No. 5, capacity 2½ in. to 12 in. pipe.
No. 5-A, capacity 2½ in. to 16 in. pipe.
No. 5-B, capacity 2½ in. to 20 in. pipe.

With the flange attachment, the Ideal wrench becomes the most complete pipe fitting tool on the market, as it is the only available wrench capable of doing pipe, fitting, and flange work.

The users of Ideal wrenches can purchase the flange link separately.

A CHAT ABOUT CLEANOUTS

Continued from page 15.

and there was considerable labor entailed in cutting out the plug from the iron body with a hammer and chisel, owing to the corrosive action of the sewage gases, which can be plainly seen on the lower threads.

Fig. 2 and Fig. 3 are somewhat similar cases. Figs. 4 and 5 are both brass rings that were each mounted in a cast iron disc with a gasket between it and the faced end on the iron body. In both cases the disc was battered to pieces before it would leave the body or tailpiece and both of the rings were more or less stripped of their threads by erosion, though Fig. 5 had sufficient thread left to turn out with a deal of persuasion, while Fig. 4 was pretty well cut away in the process.

TORONTO SOCIETY HOLDS ELECTION

New Men Elected — Business and Pleasure Combined — Pathescope Co. of Canada Entertains the Members at Close of Business Meeting

THE regular December meeting of the above society was held on Wednesday, December 18th, 1918, and was styled Election Night, the following officers being elected to office for 1919:

President—Thomas H. Ferguson.
Vice-President—Kenneth B. Allison.
Treasurer—Thomas M. Maxwell.
Secretary—Garrett F. Frankland.
Warden—Roy E. Belyea.
Tyler—John W. Cracknell.
Auditors—W. R. Harry Daniels and Roy C. Belyea.

Trustees

George Clapperton, Frank R. Maxwell, George McGuire, Thomas B. Smyth, Harry G. Waterman and John Wright.

Executive

George Clapperton, Harry A. Farthing, Fred H. Gentle, E. Lewis LeGrow; Frank R. Maxwell, Alex. S. Purdy, Harry G. Waterman, Fred A. Wiles, and John Wright.

The chairmen of the different committees are yet to be appointed, as well as the members of same, and will be announced later upon appointment by the executive committee.

Mr. John Wright, chairman of the Sanitary and Legislative Committees for 1918, presented his report for the year, and same was referred to the Executive Committee for action thereon.

Secretary Frankland's report on the Canadian Building Industries Conference, held in Ottawa, was ordered to be forwarded to the members in abstract form.

The evening closed with a delightful programme of moving pictures, for which pleasure the members were very thankful to Mr. William Redpath, manager of Pathescope of Canada, Limited.

HOW ONE FIRM INSTRUCTS ITS FOREMEN TO ACT TOWARD VETERANS

One of the largest concerns in Canada has issued the following notice to its foremen in reference to proper treatment of returned soldiers as employees If all employers realized the truth of its statements there would be fewer re marks about the alleged unreliability of returned soldiers as workmen. This uncertainty is only a phase of short duration and the man who has had sufficient conscience to offer his life for the principles for which British Empire is at war, is pretty sure to have enough conscience to do his work faithfully. Here is the notice:

"How do you treat a returned soldier working under you? Do you consider him as an ordinary workman, let him shift for himself and look on his mistakes only as you would an ordinary employee? If so, you are assuming that he is in all respects just a normal man and should be able to do the same work as quickly and as well as the average employee. If you do, you are wrong.

"Most returned soldiers' constitutions are broken down. They have been gassed, shell shocked, and tortured by wounds, and consequently, are highly strung and nervous, and will be for some time to come. What they make of themselves depends upon you. If one of these men make a mistake and is roughly reprimanded, he is likely to shake like a leaf, get excited, etc., and be very difficult to make anything of; this is wrong. The greatest tact, care and attention that you can give these men in helping them to become useful employees is what the company expects, and moreover—you owe it to them.

"There are bound to be some exceptions, and some men will fail to make good. The success or failure of the majority, however, depends on you, and it is your privilege to help your country in this national crisis by endeavoring to make useful citizens out of the nerve-shattered men that are commencing to come back to us from the front."

LEAD-WOOL FOR CAULKING GAS-PIPE JOINTS

Gas engineers admit that about 6 per cent. of the gas manufactured is lost through leaky joints. The Detroit City Gas Company have carried out a series of experiments to test the merits of various materials on the market for caulking cast-iron pipe joints. The most interesting fact developed was the strength of a lead-wool joint. The difficulty in breaking the joints led to the belief that cast-iron pipes could be caulked alongside the trench and lowered in without disturbing the joint. This was tried on 16-in. pipes, and three lengths at a time were successfully handled in this way. In making a joint with lead-wool, the jute is first driven in as tightly as possible, then the lead-wool, rope by rope. Each blow upon the lead expands it in the pipe and at the same time drives back and holds the jute so that the lead completely fills the lead space. The result is a joint that can shift several inches without leaking.—"American Gas Engineering Journal."

Simplicity is the Keynote of .. MORRISON .. Automatic Cellar Drainers

The Morrison Automatic Cellar Drainer is very **easy to install,** and when once installed needs **no further attention.** The working parts are all placed well above water, with no chance of dirt getting into them.

Customers quickly realize the **simplicity** and **advantages** of this **Ideal Cellar Drainer.** That's why there is such a popular demand for it all over Canada. That's why it's so **easy to sell** and a **money-maker** for you.

Backed by the Morrison Guarantee and Reputation, you can't go wrong.

Write us for further information and prices.

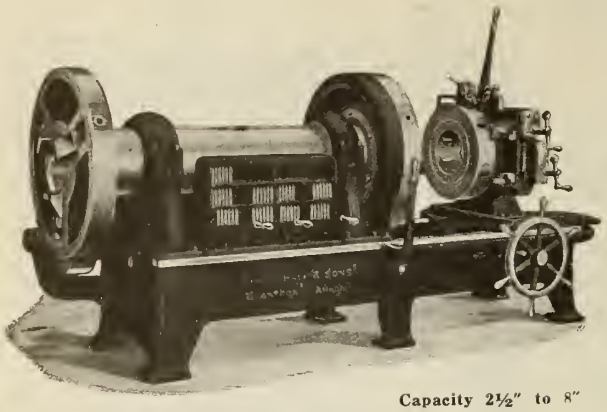
Pipe Machines of Merit



Capacity 2½" to 8"

THE HALL No. 8

Duplex Improved Gear Box Driven. Capacity 2½ in. to 8 in. inclusive.

Note the drive belt at rear out of operator's way. Elevated die cabinet, control lever and speed levers all convenient to operator's right hand. Sliding die head.

These machines are equipped with a friction clutch, enabling operator to revolve pipe a few inches, if necessary.

Pipe Machines ranging from ⅛ to 18".
Nipple Machines ranging from ⅛ to 4".
Roller Pipe Cutters ranging from ⅛ to 4".
Delivery from stock.

Write us for full particulars and prices.

John H. Hall & Sons, Ltd., Brantford, Can.

The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH

Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with wood handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

Nut with Nut-Guards

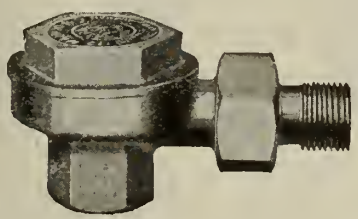
You can sell this service

Dunham Heating Service is founded on the fact that no heating service can permanently please the user **unless** steam can circulate freely and quietly through the entire system.

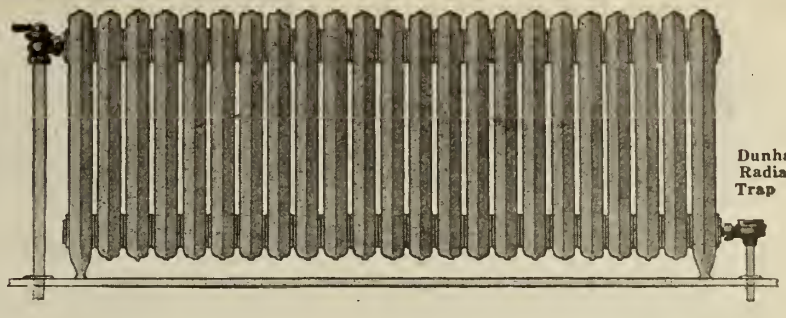
Canadian publications of wide circulation are carrying this message in an intensive manner to home owners and those in charge of offices, factories and industrial plants.

You can get your share of this new businesss by signing our Service Station contract. Write for the details of this practical plan of co-operation.



The Dunham Radiator Trap is made with special roughing-in dimensions for replacing imitating devices.

Dunham Packless Tube and Valve



Dunham Radiator Trap

The Dunham Inlet Valve is really packless—cannot leak. The Dunham Radiator Trap comprises a body, a cover and a thermostatic disc secured in the cover. Its action is positive over a wide range of temperature. Dunham products are only of one quality—the highest.

Our Service Department has some interesting data for you.

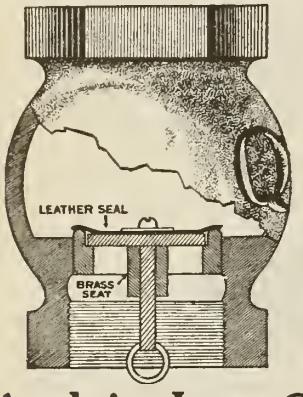
TORONTO HARDWARE MFG. COMPANY, - Toronto, Canada

WE MANUFACTURE A FULL LINE OF HIGH-GRADE RANGE BOILERS



This is a "Q" Foot Valve

And it Just *CAN'T* Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

R. MACDOUGALL CO., LTD.

First Cost *versus* Upkeep Cost!

The purchase price means nothing if the upkeep cost is not low.

The purchase price of King Boilers is no more than the average boiler and yet—

The consumption of fuel—*the upkeep cost* is lower—considerably lower.

The thin, peculiarly shaped waterways in the "King" mean quickly heated water and perfect circulation, which causes a saving in fuel because it obviates the necessity of "extra firing" to move cold water from the radiators.

The Trade should use this quick-heating, fuel-saving argument now while fuel is scarce and high in price.

PIPE AND THE PUBLIC WELFARE

By R. C. McWANE

A Book Just Off the Press

Every sanitary engineer should be the possessor of this book. It deals with pipe-making of all kinds, cast iron, wrought iron, steel, wood and tile pipe. It is valuable because it gives the users of pipe a true idea of how pipe lasts under various conditions when in service.

Price $100. Postpaid

MACLEAN PUBLISHING CO., LIMITED, Book Dept., University Ave., TORONTO

THE "NEW" MACLEAN'S

Starting with the January issue, MACLEAN'S MAGAZINE comes out in a new size—11 x 14¼—same size as *The Saturday Evening Post.* This change will enable us to give readers more entertaining articles and stories, and a very much enlarged "Review of Reviews" Section. You will find this January issue of MACLEAN'S more pleasing and instructive than the great majority of magazines you find displayed on news-stands—and

contents are carefully censored—no sex stories—you can take it into your home with the utmost confidence.

A word about the contents—

"Why Laurier Will Wait"

In discussing the policy of the Liberal leader during the coming session of Parliament, J. K. Munro predicts, in January MACLEAN'S, that Laurier will allow Union Government a free hand. In this policy of inactivity "he sees the way open to the accomplishment of all his purposes. If he is half the politician his friends believe he is, he will sit and smile and wait—yet a little longer."

All Canada is interested in what is going to happen in Ottawa. J. K. Munro, veteran press gallery man, is a shrewd observer, and his political articles in MACLEAN'S have stirred up more comment than anything else appearing in the press of the country. He knows politics from the inside. "Why Laurier Will Wait" is a forecast of the near future that bristles with interesting points. A few of the other "head-liners" in this issue:

Bolsheviks at Work in Canada

A senstaional article on activities in subterranean circles. There are foreigners in Canada ready to wave the red flag.

Achievements of the Canadian Army

Since the Canadian Division was formed, they have not retired a foot nor lost a gun—a marvellous record. An inside story of how this great army was handled and controlled is told by H. F. Gadsby who spent a month at Headquarters during the last great offensive.

The Grave Dangers of Peace

An article by Agnes C. Laut on the insidious new propaganda being launched by the Germans to split the Allies.

Jock in a Juggernaut

The most interesting war article in a long while, because it is new—it deals with experiences in the tanks.

AND THESE AS WELL:

The Dance Halls of Dawson - By E. Ward Smith

My Hour - - - By Robert W. Service

The Strange Adventure of a Rialto Rainstorm - By Arthur Stringer

The Minx Goes to the Front - - - - By C. N. and A. M. Williamson

The Three Sapphires - - By W. A. Fraser

"HAUSE" PIPE JOINT CEMENT

For steam, water, air, oil, gas, gaskets, etc. The cement that cements. Sets like gum. Allows no leaks.

The Great Value of "HAUSE PIPE JOINT CEMENT" lies in its peculiar chemical properties which permits of its hardening and expanding after the joints are made up. In making up joints it has the same effect as a lubricant on the best graphite, and while the joints may be made and broken readily, a perfectly tight joint is maintained at all times. Comes in 1-lb., 5-lb., 15-lb., 25-lb., 50-lb. cans, 100-lb. barrels. Manufactured in ready mixed and powder form. Ask your jobber for prices, or write us direct.

Manufactured in Ready Mixed and Powder Form.

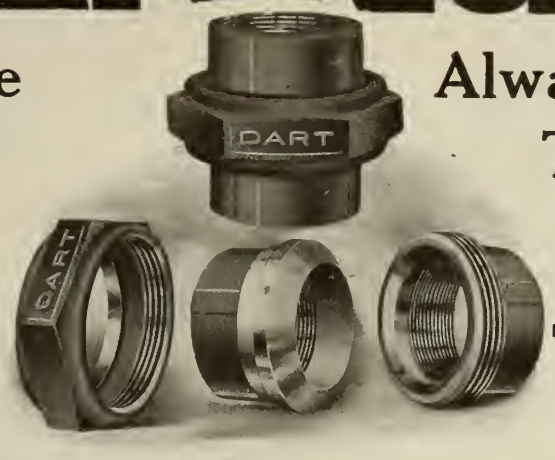
DART UNIONS

Once Tight — Always Tight



The seat is ball-shaped, which allows perfect connection, so long as the nut can be started on its thread. The threading is full, clean-cut and exact to size.

Dart Union Pipe couplings stay tight because the Bronze faces will not rust or corrode and the heavy iron parts will not stretch or pull apart.

Dart Unions stay as tight as you make them for years and years. Leaks will not develop, and they will please your customers.

KERR GATE VALVES

I. B. GATE

These Iron Body Gate Valves were designed and are made by US to meet YOUR demand for strong, substantial, interchangeable valves, with a "nobby" appearance.

They meet the requirement and more. When they get us a customer they hold him.

Who in the Steamfitting trade has not heard of and used Kerr's (Weber) Brass Gate Valves? We say "Kerr's"—not the imitations. We make this valve of uniform material, and they stand up to the work given them, just as they always have. Some have tried others, but they came back to the tried and trusty old "Weber Gate" made by Kerr. What is a few cents on a valve, when you can get one like the genuine "Weber"?

Have you our Catalogue No. 5?
If not, we will mail you one.
A postal to-day will bring it.

Dominion Rubber System Belting Insures Maximum Service

Dominion Rubber System Belts are built to a scientific quality standard which insures the proper width, thickness and type of construction to efficiently serve a given purpose.

Dominion Rubber Systems Belts are *one-piece belts*—with absolute uniformity, dependability, economy and satisfaction built into each foot.

The layers of strong endless fabric are saturated and embedded in special rubber which gives a toughness that is practically indestructible.

Its rubber surfacing has a tested pulley grip greater than that of any other belt made, hence it allows minimum power leakage.

Where water, acids, oils, dust, grit, belt-shifters, etc., soon ruin ordinary belting, there is a type of Dominion Rubber System Belting that will withstand the severest punishment and eliminate many replacements and delays.

The largest users of belting in Canada have proved the value and efficiency of our belting in actual service, and through the special free service of our belting experts have cut costs and speeded up production.

This free technical service is yours to command whether you are a customer or not and it opens the door to the entire facilities of the largest rubber organization in Canada with a fifty year record for producing dependable products.

If your belting problems need emergency service, phone or wire our nearest branch.

"MADE IN CANADA"

Getting Down to Business

To-day Canadian Business faces an era of stupendous possibilities. We are about to enter an age of industrial prosperity unmatched in history. The vast, unsuspected reservoirs of economic resources the war has tapped cannot be sealed up. They are known, open and flowing and must continue to flow for the benefit of all mankind. This is an obligation arising from the unquestioned Leadership in Finance, Transportation, Industry and Agriculture, which the fortunes of war have thrust upon Canada.

In the Whole British Empire

There is but one firm producing PNEUMATIC WATER SUPPLY SYSTEMS, building their own tanks, pumps, electrical equipment, etc., in short, SYSTEMS.

In the Whole World

There are but three firms in this class—one of them right here in Canada—all the others, and they are legion, are assemblers, buying a tank here to-day, somewhere else to-morrow, pumps, switches, circuit breakers, and the many other items necessary from a thousand sources.

How can such a combination become a SYSTEM in the sense that the various parts will operate in harmony—that will go together and "WORK AS YOU HOPED THEY WOULD?"

If you have had troubles with imported goods, you will know the difficulties experienced in overcoming them—the loss of time—the expense—prolonged correspondence—the dissatisfied customers—all through no fault of yours, EXCEPT that you did not BUY IN CANADA.

The whole world is watching Canada. Are you helping?

First Cost *versus* Upkeep Cost!

The purchase price means nothing if the upkeep cost is not low.

The purchase price of King Boilers is no more than the average boiler and yet—

The consumption of fuel—*the upkeep cost* is lower—considerably lower.

The thin, peculiarly shaped waterways in the "King" mean quickly heated water and perfect circulation, which causes a saving in fuel because it obviates the necessity of "extra firing" to move cold water from the radiators.

The Trade should use this quick-heating, fuel-saving argument now while fuel is scarce and high in price.

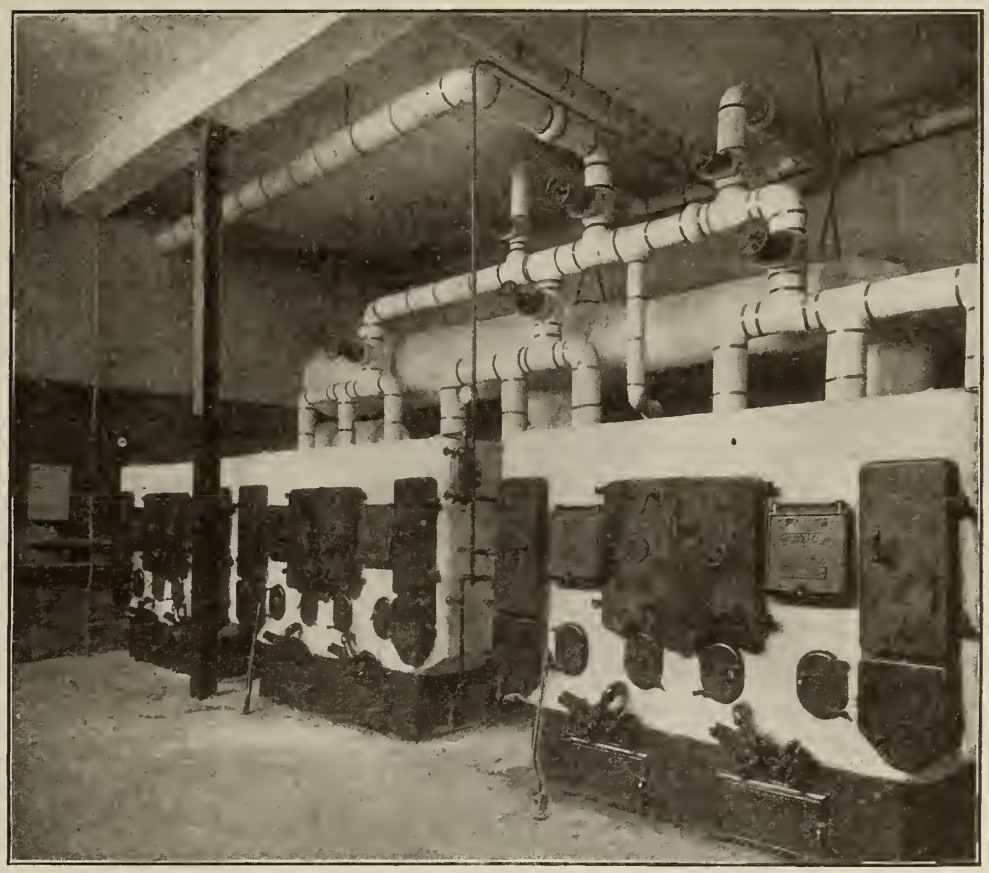
THE SPENCER IS THE MAGAZINE BOILER

Not a Boiler with a Magazine

NO HEATING SYSTEM TOO LARGE



NO HEATING SYSTEM TOO SMALL

This plant is doing duty in Earl Kitchener School, Hamilton. Installed by Adam Clark Ltd., Heating Engineers, Hamilton

3 No. 26's in battery. Combined heating capacity, 25,500 square feet.

Burns Any Kind of Fuel, Including Gas or Oil

The Spencer Boiler enables the owner to benefit from the economy in the cost of the fuel and reduction in the tonnage consumed.

The Spencer will burn any grade of fuel, including wood if desired. With regard to the burning of soft coal in the small sizes by way of the magazine, the fact that the fuel is tempered enables the boiler to burn this fuel with a greater freedom from smoke than is possible with any other type of boiler. The double water-tube construction of the Spencer Boiler also is the most efficient surface for the burning of gas or oil.

Anthracite, soft coal, and coke in the sizes known as No. 1 buckwheat, pea and small nut, will feed by way of the magazine, while the larger sizes can be fired in the boiler in the regular way—that is, in similar manner to the firing of an ordinary boiler.

Recent laboratory tests in prominent Science Departments of Universities on this continent, using low-priced anthracite coal, proved that the temperature of the flue gases leaving the boiler was less than 300 degrees, while operating at 5 lbs. steam pressure, and the ash refuse was 15.4. These results are due to the efficient heating surfaces of the Spencer Boiler, coupled with the above stated features.

We employ competent heating engineers and a service department for the purpose of providing the trade with full information for the proper installation of the boilers, and written guarantees are furnished with every specification concerning the operation and construction of the boiler in all details.

Write us for literature descriptive of the Spencer.

It will pay you to be the Spencerized heating contractor in your district.

The Value of the Business Press to Business Men

"Business men do not realize the value which trade journals and technical magazines may have for them in increasing the efficiency of their factories and in giving them a broad and comprehensive view of their business.

"Our foreign competitors read almost every article published upon their business with great care and thoroughness. Many of them have duplicate copies of their favorite trade paper sent to their homes so that they may read them away from the business without being disturbed. Many foreign manufacturers contribute articles to these journals on phases of the business with which they are most familiar. Such articles are bound to be helpful and have a constructive effect.

"Our trade journals and technical papers are the best in the world, and they should be supported and encouraged by our business men.

"Copies should be placed where employees can see them and they should be urged to read and study them.

"These papers are preaching the gospel of sound business on practical lines and are helpful not only to business but to the country as a whole.

"If the suggestions made by them in the past had been followed by our business men it would not be necessary at this time to point out some of the fundamental weaknesses in American business."

—Edward N. Hurley, formerly Chairman of the Federal Trade Commission, in "The Awakening of Business."

The following is list of the MacLean publications. Every publication is a leader in its field. Write us for any information you may desire with regard to the field covered, advertising rates, etc.

A REAL MONEY MAKER

True conservation means investing money in such a way as to give maximum service to all concerned at least possible cost.

The cost of doing without a **Clark Temperature Booster** on a hot water heating system means at least a loss of 15 per cent. at the coal pile. And it's a patriotic duty these days to conserve coal.

A REAL COAL SAVER

If you tell your customer that you can show him how to save 15 per cent. of coal and get better results from his hot water heating system and that the cost only amounts to about the price of a couple of tons of coal, he'll ask you how.

CLARK TEMPERATURE BOOSTERS

will do all and more than we claim for them. They will not only increase the temperature and save coal when installed on a good heating system, but will make a **sick job well** and keep it well.

Write your jobber about it.

"MAKE NEW BUSINESS FROM OLD BUILDINGS," says the advertisement before us, and from old buildings the Plumber will get most of his business during the early months of 1919.

Under the caption of what you must do yourself, the writer says to every Master Plumber:

> **"PERSONAL WORK:** Do not expect any large volume of business from new construction. You must encourage remodelling and refitting. Talk about it with every one whom you meet. Instruct your clerks, your workmen, your helpers to do this. Put the situation squarely before them, and have them help you in your local sales promotion work. We are confident that the volume of business can be kept up to about normal if you and your force will do your personal share. Spend more of your time calling on house-owners and arousing their desire to have more of the economies and conveniences which you can furnish.
>
> Adopt the suggestions made above to your business and watch it grow!"

Our company makes the finest line of plumbers' enamelware, and issue booklets and descriptive matter that will help the plumbers to close a contract. The booklets are free on application.

SANITARY ENGINEER

VOL. XIII. JANUARY 15, 1919 No. 2.

INVESTIGATION OF CORROSION IN HOUSE DRAINAGE PIPING IN CHICAGO

A Paper Read at the American Society of Sanitary Engineers at Their 13th Annual Convention, October, 1918—One of the Most Interesting and Thorough Investigations Ever Made in Connection With House Soil Waste and Drainage Piping in America

By THOS. J. CLAFFY, Assistant Chief Inspector of Plumbing, Chicago, Ill.

IT has been observed for some time by those in close touch with plumbing installations in Chicago and elsewhere that under certain conditions, iron pipe is affected seriously by rust. The corrosive element, whatever it may be, seems to have more effect on one kind of pipe than on another, and also to be worse in some buildings than in others. In previous investigations conducted by the Research Committee of this society, special attention was given to the house drains and sewers.

It was suggested to the author some months ago that some attention should be given the pipe in the system above the basement or cellar floor. An investigation of this kind appeared to be not only practical, but of great value, if successful. About May 1st an inspector was, therefore, assigned to make a canvass of that portion of the down-town section of Chicago covering La Salle, Clark and Dearborn streets, between Randolph and Van Buren streets. In this section we find nearly all of the large office buildings, several banks, and the Municipal and County buildings. Also, the U.S. Government building, which contains the post office and federal courts. On account of war conditions the investigation did not include this building. We aimed to confine our attention to buildings 6 stories and upwards, and over 5 years old. One or two less than five years were included because of the conditions noted in buildings very close to that age.

The Introduction of Screw Pipe

Cast iron pipe has been recognized for many years as a very durable material for soil, vent or drainage purposes, and, consequently, has been much used in building construction, and, no doubt, its use will continue. When construction of buildings over six stories high began, a new epoch was introduced in building construction and we very shortly had buildings twice that height and higher. About 30 years ago began the common use of screw pipe in plumbing systems in such buildings. With the introduction of special recessed drainage fittings such pipe soon became exclusively used, and the entire system became known as the Durham System of House Drainage, Mr. Durham being the inventor of the fittings used. Because of the fact, noted in recent years, that there is a great deal of corrosion in drainage pipe systems, it was deemed expedient to find out, if possible, the relative life and merits of cast iron, wrought iron and steel pipe in such systems.

T. J. Claffy assistant chief inspector of plumbing under whose supervision this investigation was conducted.

Method of Investigation

In making this investigation, the inspector was required to report on the height and age of each building separately; the number of vents at the roof line; size, and whether pipe was cast iron or screw joint; to obtain a sample where possible for test purposes; and, under the head of "Remarks," to describe such conditions as were found. Photographs were obtained of sufficient vents on the roofs to show an existing average of their condition. The inspector also was interviewed, whether the owner, superintendent, engineer, or other person. In order to distinguish between wrought iron and steel pipe, it was necessary to take samples for test, filings being obtained for chemical tests and pieces of the pipe for fracture tests. In obtaining filings, the outside skin, which was generally either

a heavy coat of paint or a coat of rust, was filed away and filings of the clean metal procured. These samples were sealed in individual envelopes and numbered, the numbers on the envelopes corresponding with the numbers on the investigation reports describing the condition of each waste, vent, drain or soil pipe, together with the name of the building.

Chemical Test of Pipe

All samples were tested by the so called manganese test, a very simple qualitative chemical analysis which may readily be performed by anyone having the necessary inexpensive outfit.

In the manufacture of steel pipe, it is well known that to the molten metal in the Bessemer retort a certain amount of ferro manganese is added in order to make it possible to roll and weld the over-oxidized metal. There is no such addition of manganese in the manufacture of wrought iron. The latter metal contains only a very insignificant amount of manganese, such as may have been contained in the original ore. In making this manganese test, each sample of filings is placed in a glass test tube. The amount need only be a few grains. To this is added, 10 drops of nitric acid, diluted with an equal part of water. The solution is then heated for a few seconds over a flame and allowed to cool off. When cooled, a small amount of sodium busmuthate is added. If the sample is steel, a decided pink color will show. If it be wrought iron, the solution will show a light brown color, which gradually fades away, leaving a brownish residue in the bottom of the tube. In several cases, these tests were supplanted by fracture tests, which furnish a conclusive check on the manganese test. Wrought iron fractures show a fibrous character of metal, and steel a brilliant crystalline one. For the purpose of these investigations, the tests outlined answered the purpose.

Data Collected

The table herewith contains a brief summary of the data collected, showing the name and location of each building, the age of pipe installation, the total number of roof terminal vents, number of screw pipes tested to determine whether of wrought iron or steel, and the condition of all pipes with respect to corrosion at time of investigation.

Altogether, 63 buildings were investigated, in all but two of which more or less complete data were obtained. In age, these buildings range as follows:

	Buildings
30 years ago	13
25-29 years	18
20-24 years	6
15-19 years	3
10-14 years	12
8 years or less	11
	63

Dividing these buildings, according to the kind of pipe used in their drainage systems, we find:—

	Buildings
1. Cast iron in	15
2. Wrought iron	8
3. Steel	19
4. Mixed W. I. and steel	11
5. C. I. mixed with W. I. or steel	10
	63

Photographs

A number of photographs were obtained in an effort to show the average condition of terminal vents. Unfortunately, many of these photographs leave much to be desired in clearness, something which is principally due to the lead coping entirely covering the exterior and top of the pipe above the roof. It is, therefore, difficult to depict the interior corrosion, as this is usually best revealed by the thinness or thickness of the pipe around the edge at the top. Only to a smaller degree is the degree of corrosion indicated by the flaking or pitting of the interior surface, as a thin crust of rust flakes in a photograph does not look much different from a heavy crust of rust flakes.

Installations over 20 years old

Pipe	Total Number	No. of vents entirely or nearly destroyed.	Estimated percent. destruction.
Steel	33 vents	All practically destroyed	90%
Wrought Iron.	155 vents	17 vents nearly destroyed	20%
Cast Iron	218 vents	43 vents nearly destroyed	25%

Plate No. 4

Wrought Iron, 28 years old

Old Colony Building, Chicago. The black wrought iron vents—19 in all—are in good condition.

Steel Pipe, 7 years old

City Hall, Chicago, Ill. Erected 1911. 42 galvanized steel vents already scaling badly.

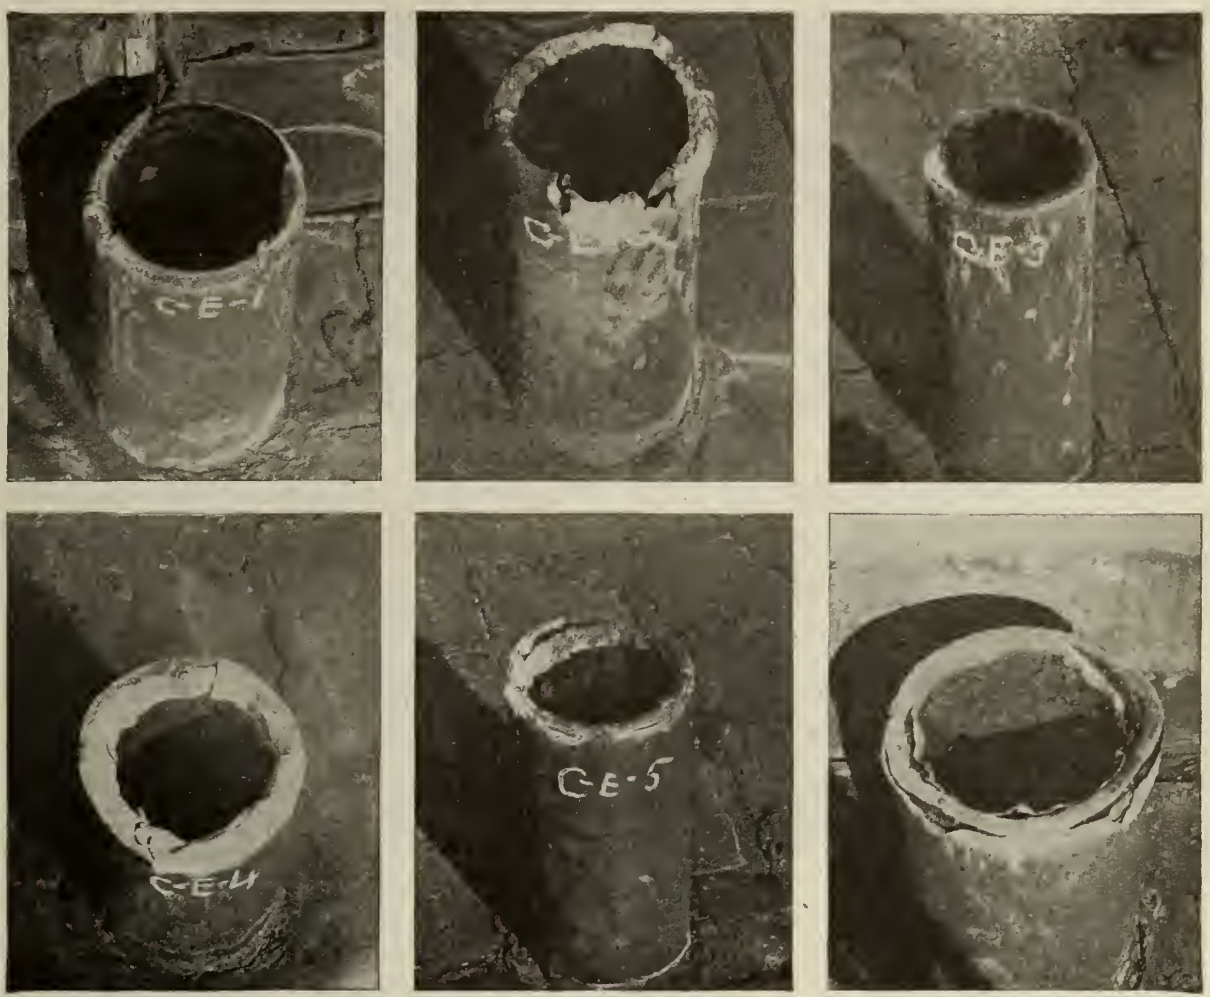
Plate No. 5

Plate No. 6

Steel Pipe, installed 1908, Cook County Bldg., Chicago

All the black steel vents on this building are from 50% to 75% destroyed by corrosion. 17 galvanized steel vents on same roof are already scaling badly. All 10 years old.

Plate No. 7



No. 1—Scaling badly.

No. 2—Almost destroyed, only thin shell remaining.

No. 3—About 25% destroyed.

No. 4—Almost destroyed, only thin shell remaining.

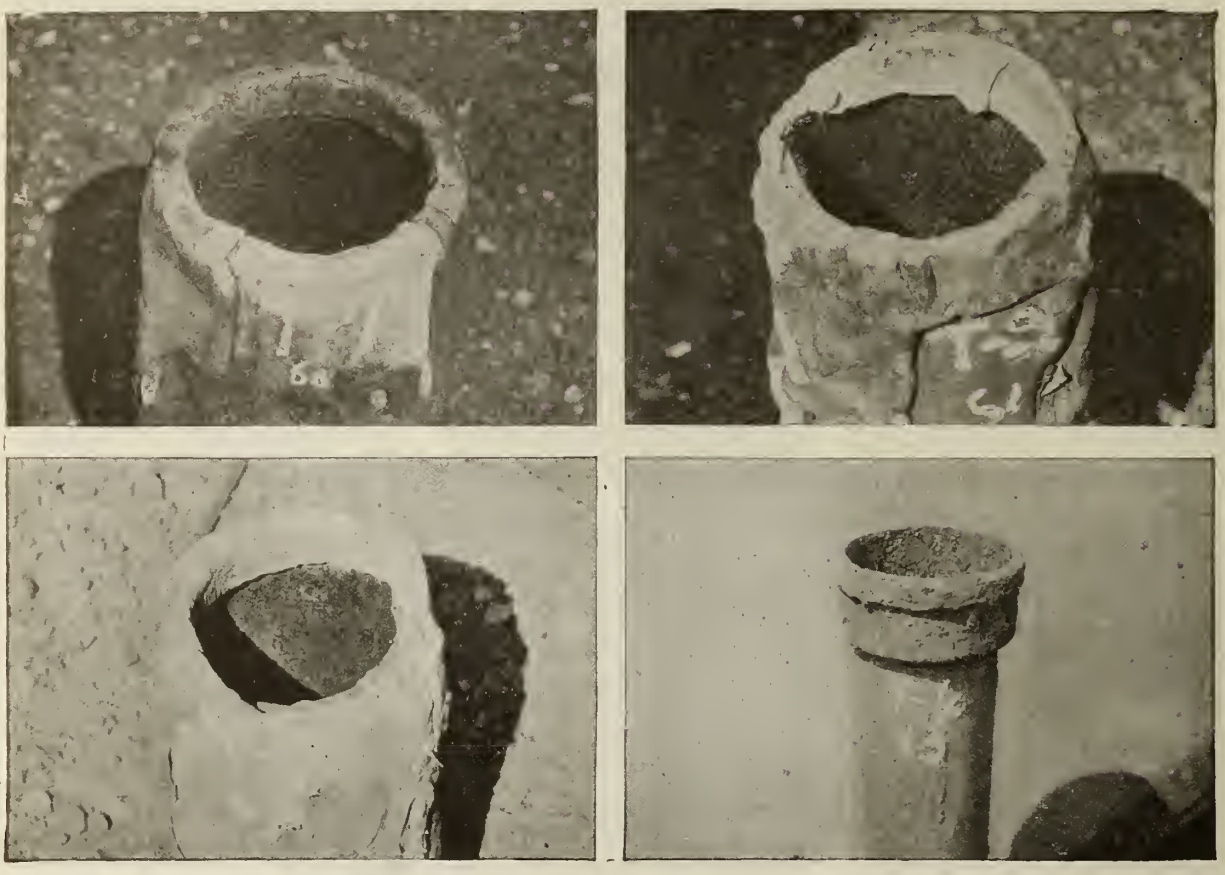
Nos. 5 and 7—About 25% destroyed.

No. 6—About 50% destroyed.

Note:—Although vent No. 7 is in a better condition than most of the others, it shows the severe corrosion more clearly due to the removal of the coping at the top. All of these vents are only 10 years old, and of black steel.

Steel Pipe, installed 1908, in the Corn Exchange Bank Building, Chicago, Illinois

Plate No. 8



Wrought Iron after 30 years' service, Tacoma Building, Chicago. Erected 1888

All the black wrought iron (as well as the cast iron) vents on this building in an excellent condition. Slightly pitted, but very little loss in thickness.

Hence it is necessary to note the descriptions under most photographs of pipes in order to get a beter idea of their actual condition.

Tabulated Records of Pipe Corrosion In Buildings Investigated

Note: Letter g after the words "iron" or "steel" means galvanized. Letter b means black. Where no letter is appended, it is understood the pipe is black. Letters X and S after cast iron, mean "extra heavy" and "standard weight," respectively.

Rating of Cast Iron, Wrought Iron and Steel

If we analyze the records for all systems over 20 years old, as recorded in the table, and also in the individual reports which are too voluminous to be embodied in this report, we find that a total of 33 roof terminal vents were steel, 155 wrought iron, and 218 cast iron. If we now attempt to summarize as far as possible the condition of ail these vents, we find the interesting facts as per table following:

Installations Over 20 Years Old

The poorer rating for cast iron in comparison with wrought iron, as shown in this table, is, to some extent, due to the probable higher average age of the cast iron installations. The comparison refers only to destruction or near-destruction by corrosion, and does not take into account several dozen cast iron vents which had clogged up with rust at the increaser below the roof and thus become temporarily useless. Neither does it take into account the condition of the joints, which would further improve the rating of wrought iron over cast iron. Steel pipe, it will be noted, is so completely destroyed by corrosion after 20 years, as to exclude all consideration of joints or clogging, which might otherwise be figured in its favor.

Buildings From 10 to 19 Years Old

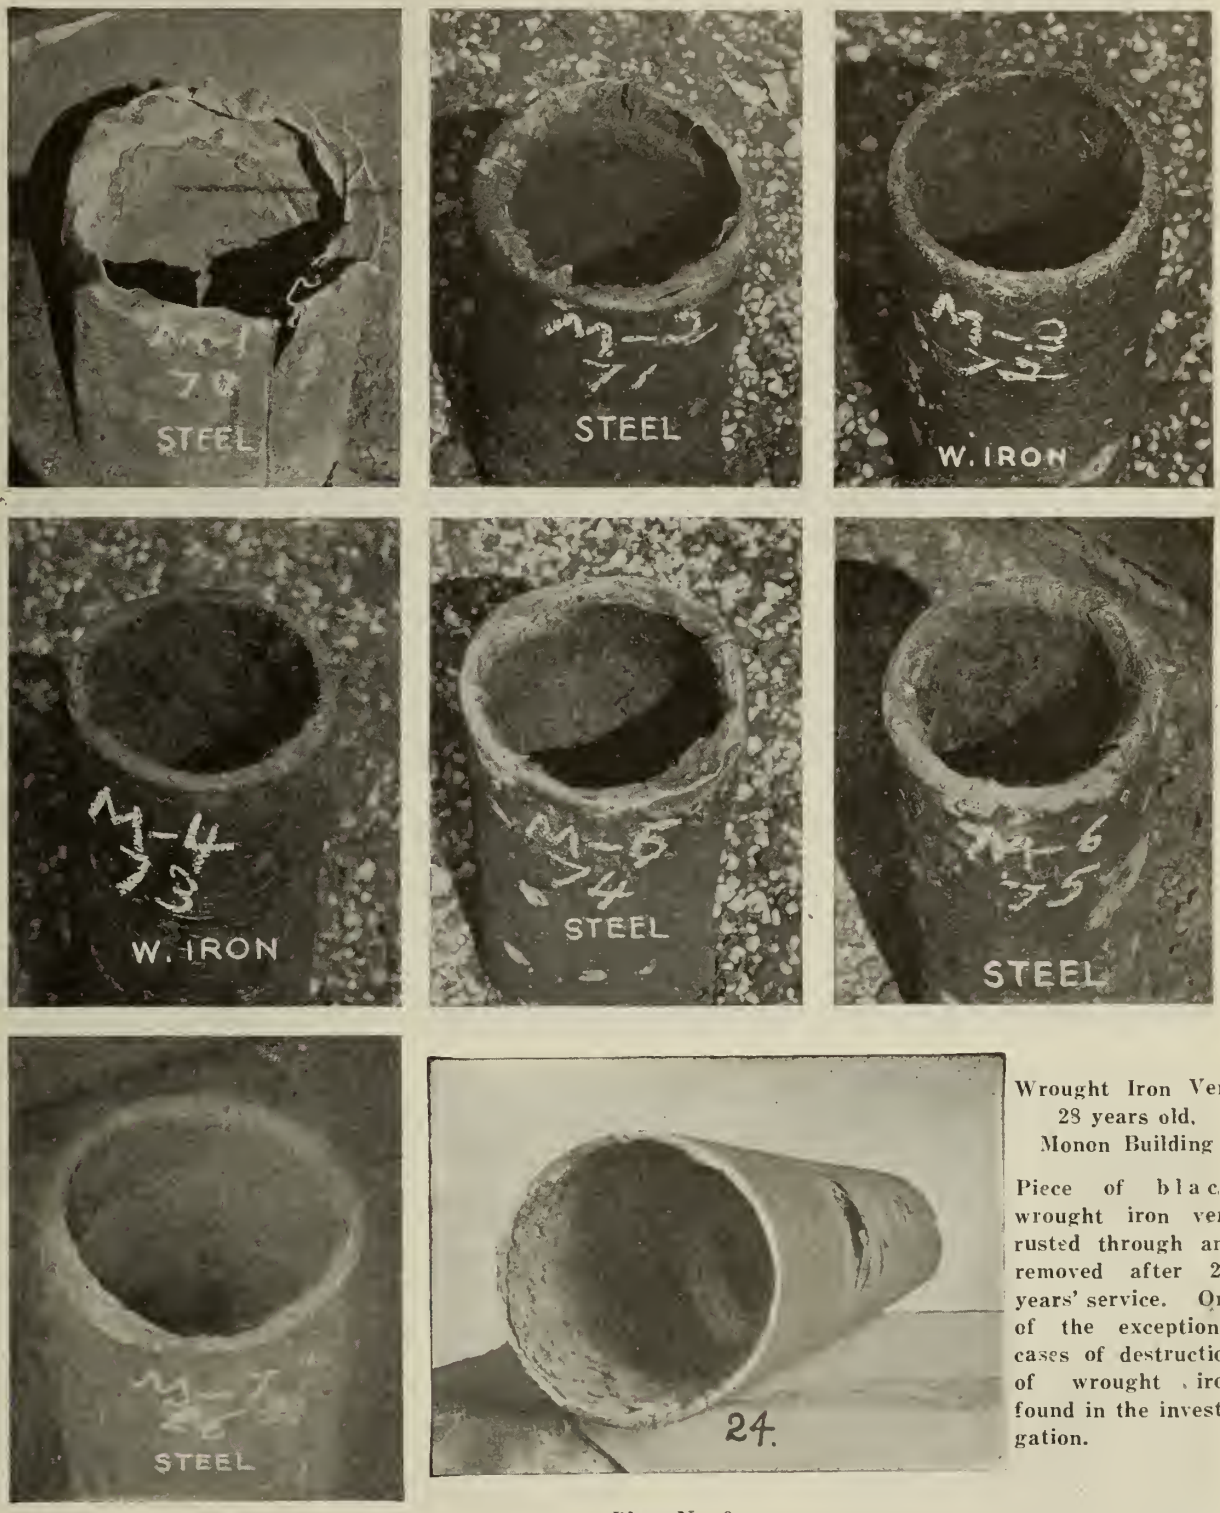
Turning now to buildings from 10 to 19 years old, the table exhibits a large number of steel installations, indicating how completely steel pipe, on account of its slightly lower first cost, has come into use in Chicago. A rating table, compiled along the lines just described, but distinguishing between black and galvanized pipe, follows:

10 to 19 Years Old

With reference to galvanized steel pipe, it appears that galvanizing is partly or wholly destroyed before the pipe is 15 years old, protecting it from destruction to this extent, the pipe, as

Plate No. 10

WROUGHT IRON AND STEEL PIPE, INSTALLED 1894—MARQUETTE BUILDING, CHICAGO



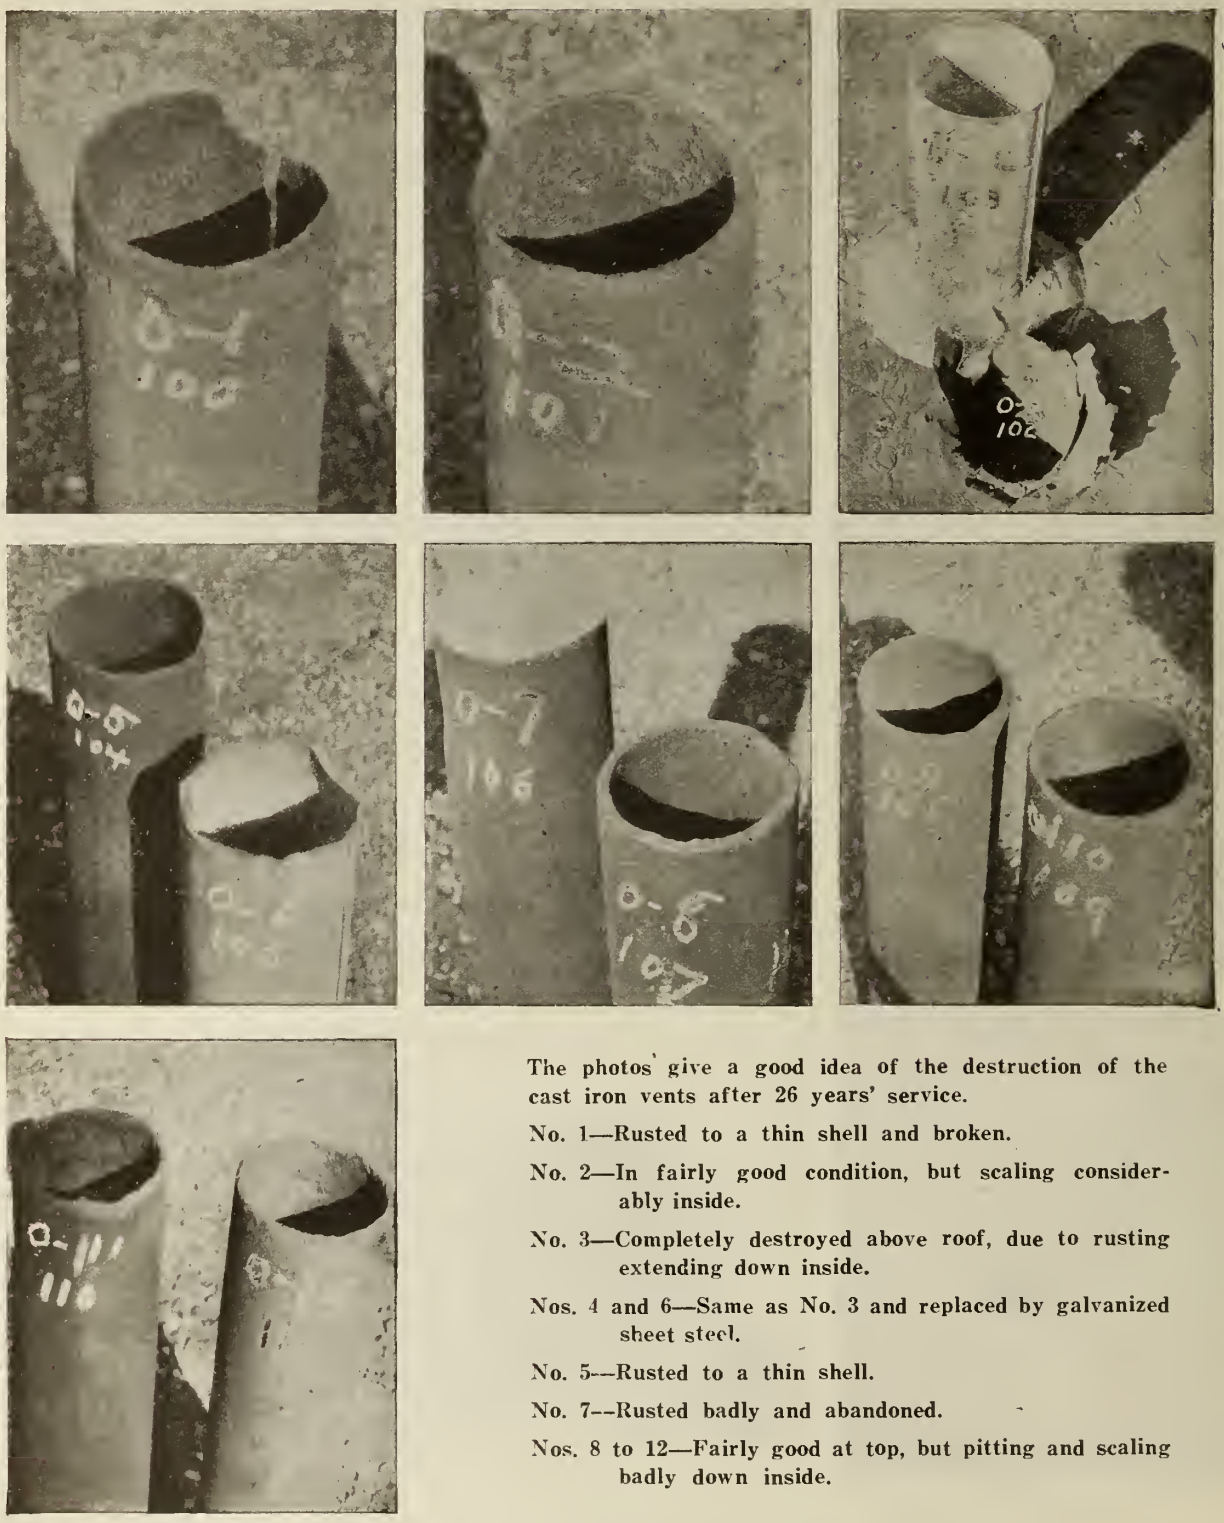
Wrought Iron Vent 28 years old, Monon Building

Piece of black wrought iron vent rusted through and removed after 28 years' service. One of the exceptional cases of destruction of wrought iron found in the investigation.

Plate No. 9

Nos. 1 and 2—Nearly destroyed (steel b). Nos. 3 and 4—Pitted, but in good condition (wrought iron b). Nos. 5 and 7—Scaling badly, from 50% to 80% destroyed (steel b). No. 6—Scaling badly (steel b).

Plate No. 11



The photos give a good idea of the destruction of the cast iron vents after 26 years' service.

No. 1—Rusted to a thin shell and broken.

No. 2—In fairly good condition, but scaling considerably inside.

No. 3—Completely destroyed above roof, due to rusting extending down inside.

Nos. 4 and 6—Same as No. 3 and replaced by galvanized sheet steel.

No. 5—Rusted to a thin shell.

No. 7—Rusted badly and abandoned.

Nos. 8 to 12—Fairly good at top, but pitting and scaling badly down inside.

CAST IRON, INSTALLED 1892, OXFORD BUILDING, CHICAGO

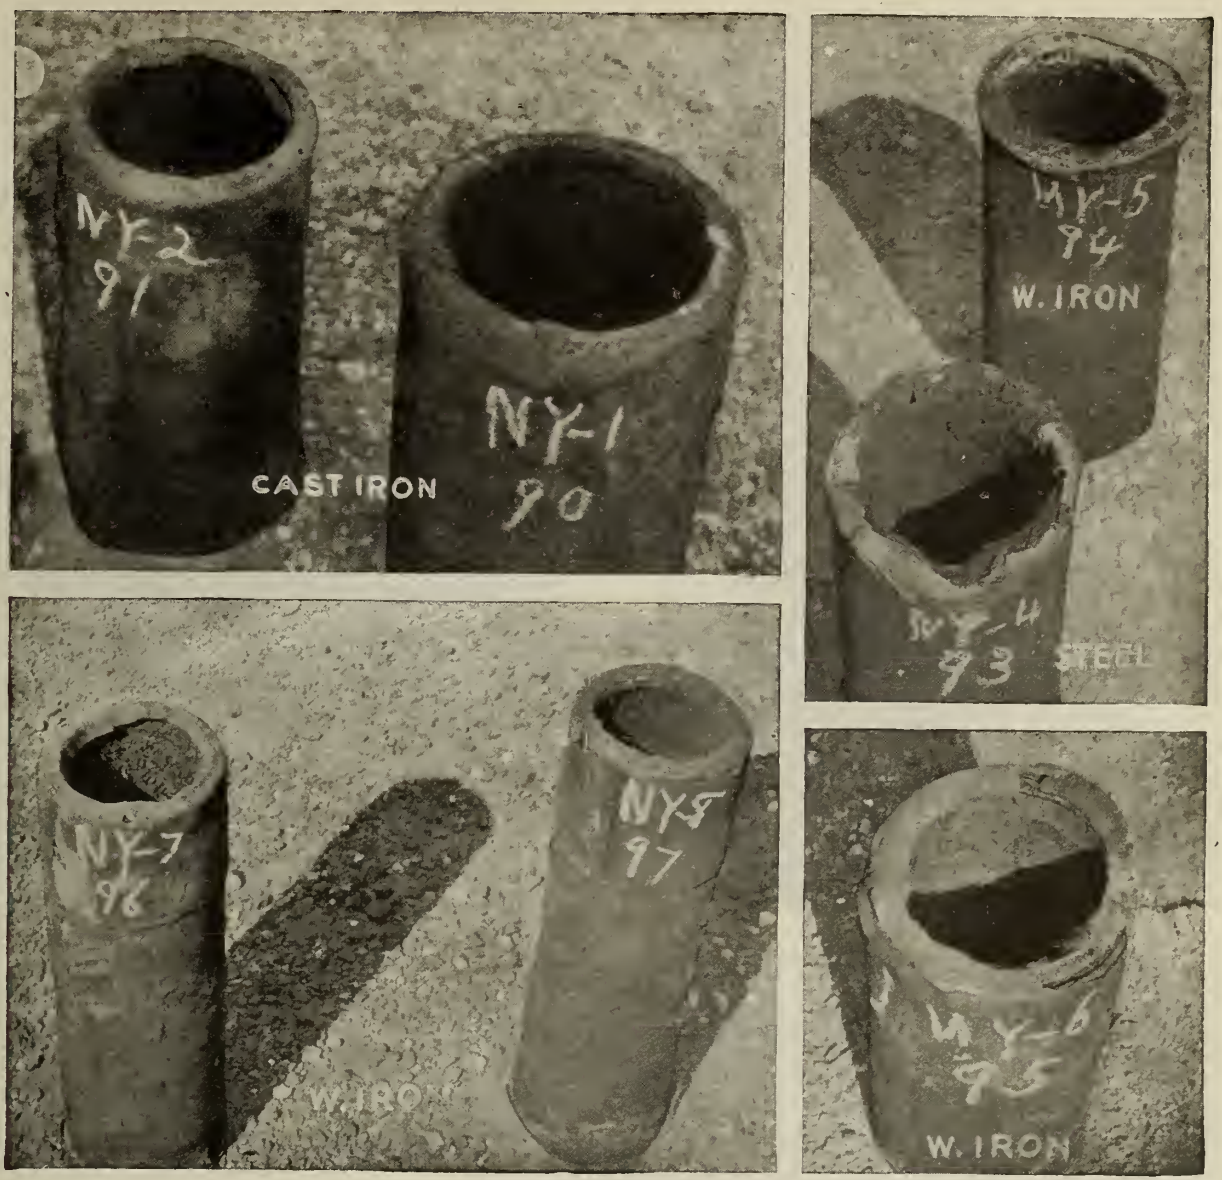


Plate No. 12

2 cast iron scaling down inside; 3 wrought iron scaling slightly; one wrought iron 25% destroyed. 1 steel (No. 93) nearly destroyed.

All the above vents are 24 years old, installed in the New York Life Building, Chicago.

CAST IRON, WROUGHT IRON AND STEEL IN THE SAME SERVICE

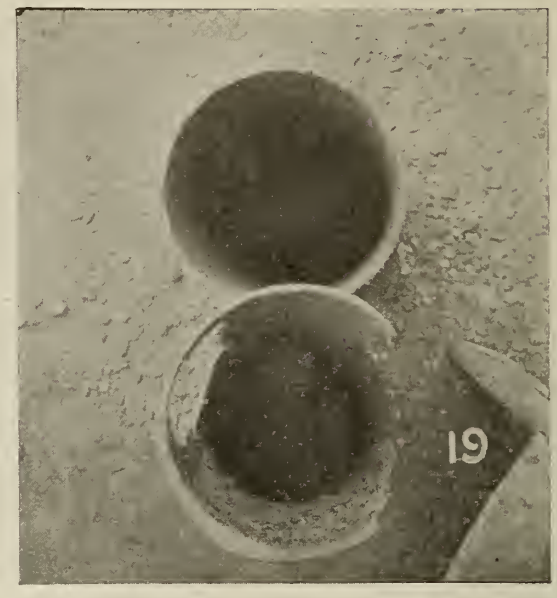
a result, lasting from 15 to 25 years before complete destruction is observed. The relatively good condition of wrought iron, both black and galvanized, should again be noted. The 10 per cent. given in the table for both wrought iron and cast iron indicate a slight depreciation, but no actual failures.

Buildings Less Than 10 Years Old

In perusing the tabulation, one is struck by the fact that the severe corrosion of steel pipe becomes evident even before the building has passed its first decade of existence. Notable examples are the Cook County Building, 10 years old, with 34 steel vents, about half of them galvanized. Further, the City Hall, 7 years old, with 42 steel vents, all galvanized, but in spite of this, all scaling severely. This does not lend substance to the oft repeated claims concerning the marvelous improvement of steel pipe in recent years. If anything, these new installations seem to be relatively worse than the older ones.

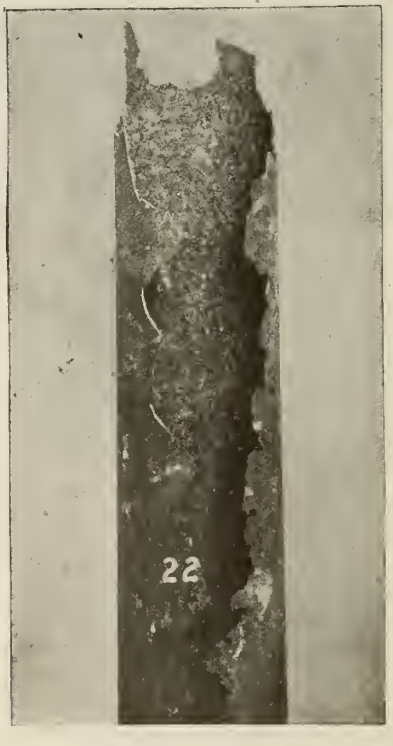
All Corrosion Internal

If the destruction of the different kinds of pipe mentioned was confined to the roof line or the space immediately below it, there might be some grounds for believing that sulphuric acid gas from burning coal would be the destructive element. This, however, is not the case, as the corrosion is mainly from the inside of the pipes. In the Borland Building, the soil, waste and vent pipes at the third and fourth floor levels were entirely rusted away, while the same lines of pipe near the roof were practically as good as when installed. In the Unity Building a wrought iron waste line from urinals was rusted out



Cast Iron vents, Hoyne Building, erected 1873. 112 No. La Salle St.

Cast iron rusted, broken and filled up with rust. 3 wrought iron pipes on same roof are in good condition. (Some doubt as to age of installation. It is supposed to be about 30 years old).



3501 S. State Street, Chicago.

4" standard cast iron, just above the top Tee in bathroom. Supposed to have been installed in 1875. Completely destroyed by corrosion.

Note:—The installations illustrate that cast iron is not immune to corrosion, even though it usually gives very satisfactory service from a corrosion standpoint.

Plates Nos. 19, 20, 21, 22

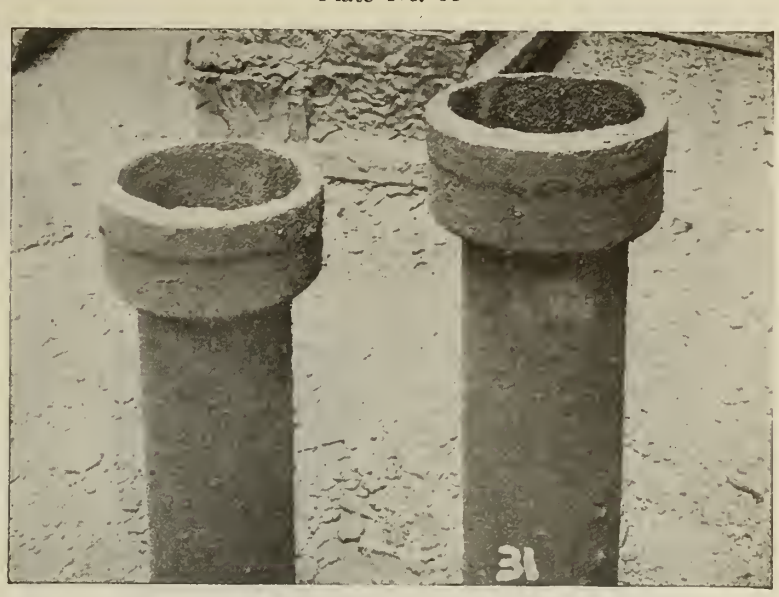
entirely from the third floor up. In the Great Northern Hotel building it was found during the process of reconstruction of bath rooms about ten years ago that the old pipe system of waste and vent pipes was entirely destroyed at the threads, and over practically the entire length of the pipe in many places. In other instances drains hanging on the basement ceiling had rusted through and had to be replaced and branch soil and waste pipes on intermediate floors were subject to the same deterioration from internal corrosion. So it is clear that the agency causing corrosion is not from the atmosphere above the roof, but is due to the gases developed within the plumbing system itself and from the sewer in the street.

It is recognized that in downtown Chicago the main street sewers are too small, a condition which is made worse by the fact that they are elevated but a few feet above the lake and river outlets, giving a very sluggish flow. The street sewers have been found full of water well beyond midnight, when repairs are usually made without difficulty in other cities. Further, the pipe sizes used in vents and wastes in large buildings generally are too small and skimpy, resulting in blowing out of trap seals and in syphonage of fixtures. The conditions noted with respect to sewers long since caused the main house trap to be abandoned, the sewers and house drains being ventilated through the plumbing system. The sewers are also ventilated by means of man holes in the street. Altogether, there can be no question but what these conditions combine to aggravate the corrosion in pipes in this city, for although corrosion of drainage piping is severe everywhere, it appears to be about 50 per cent. worse in Chicago than in New York and other cities. We discovered in the course of the investigation considerable evidence indicating how to improve the service obtained from the pipe system, both in respect to proper functioning of fixtures and pipes, and lessening of corrosive attack.

Height of Vents Above Roof

The general practice in Chicago is to extend the vents about one foot above the roof, while in New York City, vents on large buildings are usually from 7 to 12 feet above the roof. Very few people can furnish a satisfactory explanation of this difference in practice. I think the case of the Standard Trust & Savings Bank building in Chicago explains the reason. In this building trouble was experienced with syphoning of fixtures. It was thought to be caused by the suction of winds sweeping over the roof, preventing the free influx of air to the vent to relieve the vacuum in the wake of water rushing down the pipes. Galvanized sheet steel extensions about 5 feet high were therefore fitted to the top of the vents, with the result that the trouble was completely eliminated. The extension also is to be recommended because it serves to keep the exceedingly strong fumes from being inhaled by workers or occupants of the roofs and pent houses.

Plate No. 31



Extra heavy Cast Iron, 30 years old, McCormick Building, Chicago
Showing typically good condition of cast iron after 30 years' service.

Vent Increased at Roof

City ordinances in Chicago demand that the size of vents and soil stacks be increased from a point directly below the roof to the top of the pipe, to prevent hoar frost from closing up the pipe in cold weather. Unfortunately, this causes rust and dirt falling down the pipe to find lodgment at the increaser, clogging up the pipe and de-

(Continued on page 34)

Plate No. 32

Roof of Standard Trust & Savings Bank
To overcome siphoning of fixtures, the vents were extended about 5 feet above the roof by means of temporary galvanized sheet tubes. This remedied the trouble. (See paragraph "Height of vents above roof.")

THIS PLANT IS A
THE WHOLE

This style of laundry tub is tapped so that all bibbs are below the covers when closed.

The very tub for a kitchen, where the covers can be used for table or for folding clothes on, etc.

The iron legs suggest both strength and neatness when this tub is installed in the kitchen.

THE "ARISTOCRAT"

WE CARRY LARGE STOCKS

We carry one of the largest and most complete stocks of plumbing goods. Cast iron enamelware, porcelain ware, brass goods and other sanitary specialties. We handle cast iron soil pipe and fittings and septic tank syphons for country sewage disposal systems. And we can make prompt deliveries to any part of the Dominion.

WE MANUFACT
Uniform in Thi

W. G. HARRIS, Senior President.

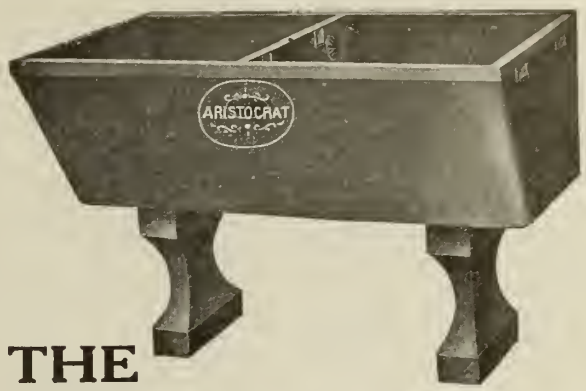
SOLDER FOR EVERY PURPOSE

Regarding Solder. We believe we have the finest line of solders on this continent and the reason why we make this assertion is: First, we mix all our metals to formulæ based upon the very best scientific practice. Second, we seldom have a single complaint from those who are using it every day, and third, because we have a large variety of both wiping, bar and wire. Solders that in form and quality are suitable for every purpose known.

CANADA METAL
Montreal Hamilton TORC
WE HAVE EVERYTHI

T YOUR SERVICE
YEAR ROUND

This type of tub is more suitable for the basement laundry. It is furnished with or without holes for bibbs. The cement legs are more suitable where dampness exists. Both tubs are made of a special mixture, which has been proved by scientific researches to be the best for the purpose. And we guarantee every tub.



THE "ARISTOCRAT"

SHEET LEAD.
ss and Quality.

SHEET LEAD FOR FLASHING

You cannot procure a better and more dependable line of sheet lead on the continent than we make. Even in thickness and quality, and in any size or weights. Ask us about our flashing lead, it works up easily and will not crack. Our lead waste pipe, too, is one of the best recommendations we have.

SERVICE AND QUALITY

Now. With such a plant at your disposal and with such an efficient staff we feel sure that you will agree with us that we can give the trade of the best in material, and the very best in service.

We only ask you to place us on trial and we are willing that you be both judge and jury. Surely that offer is fair, and do not forget that we have everything for the plumber; just ask us.

W. G. HARRIS, Junior Vice-President.

OMPANY, LIMITED

INVESTIGATION OF CORROSION

Continued from page 31

feating the purpose of the ordinance. This tendency to clogging is noticeable everywhere, even in cast and wrought iron pipe installations. The type of fitting now used as an increaser has a more gradual taper than that formerly in vogue, but the tendency to clogging can hardly be eliminated. The remedy would seem to be in the adoption of larger sizes of pipes, all the way down through the building, and if increasers are used, they should never be over 1 in taper. It would seem far preferable to have the hoar frost closing up the pipes for a few days in extremely cold weather than to have the pipes permanently clogged up with rust and dirt.

Proportioning Pipes to Suit Number and Size of Fixtures

In a certain building there were over 40 closets on the 17th floor, besides lavatories and urinals. All these fixtures discharged into a 6 in. stack. During rainy weather, the rain water emptying into the main house sewer, added to the discharge from the 17th floor toilet rooms, would cause trap seals to be blown out and waste water overflowing from fixtures on lower floors and in basements. This trouble was overcome by the installation of an extra relief vent, but it would be far cheaper in all buildings to prevent costly and annoying occurrences of this kind by employing in the first installation pipe of larger sizes for both soil stack and regulation vent.

Leaky Cast Iron Joints

From the standpoint of sanitation, one leaky pipe is as bad as another, regardless of what causes the leak, be it corrosion or merely the giving way of a joint from expansion and contraction.

Although the tabulation embodied in the report does not make specific mention of the fact, many instances of leaky caulked joints were observed and unquestionably many also escaped our attention, being more or less inaccessible. Many joints also had been recaulked, but it is, nevertheless, a regrettable fact that leaky caulked joints are not always readily discovered and even less frequently repaired with promptness, in the meantime permitting the escape of gases of a noxious, if not dangerous, character. Unquestionably, the screw joint is to be preferred from this standpoint, as long as it can be obtained without sacrifice of the necessary rust resistance of the pipe material.

Steel Pipe

If satisfactory service from black and galvanized steel pipe is only obtained for a relatively brief period of five to fifteen years, and our ordinances do not differentiate between such pipe and wrought iron, I believe we are not playing fair with the public, who pays the bill. The evidence against steel pipe is as indisputable as to admit of no contention. I am firmly convinced from what has been demonstrated in this investigation, that there is a most decided difference between steel and wrought iron for such purposes as are necessary in a sanitary plumbing system, and that we should recognize that fact and in the writing of ordinances, laws or specifications we should provide that steel pipe be not used in any buildings except those of a temporary character.

REFUND ON PLUMBERS' LICENSE RECOMMENDED

The legislative committee of the Calgary city council at a meeting held recently decided to recommend to council a refund of four dollars on each license paid during 1918 by plumbers, gasfitters and steamfitters. Considerable discussion has taken place during the past few months on this subject, and a short time ago it was decided by the committee to change the license fee in these trades from five dollars to one dollar. It was the intention of the committee at that time to have this change go into effect on January 1, 1919, but at this meeting a delegation from the plumbers' union waited on the committee explaining the injustice of a journeyman in these trades being compelled to pay $21 before being allowed to engage in any work. The committee, after looking at the matter from all angles, decided that a refund of the money which had been paid by the men in excess of the former fee was due them. This will consequently be recommended to the council. Since one-half of the plumbers concerned are employers in business, the license money which is refunded to them will be paid back to the city in business tax, so that, according to the chairman of the committee, the entire refund will not total more than $150 or $160.

RETURNED SOLDIERS PASS EXAMINATIONS OF ROYAL SANITARY INSTITUTE

Through the co-operation of the Departments of Education and the Provincial Board of Health, examinations of the Royal Sanitary Institute for Sanitary Inspectors under the supervision of the Alberta Board of Examiners of the Royal Sanitary Institute, London, England, are now conducted in the Province of Alberta.

At a meeting of the Alberta Board of Examiners held in Edmonton, the following candidates were recommended for certificates to the Royal Sanitary Institute: Pte. Jas. Butterfield, Edmonton; Pte. Geo. P. Head, Metals Ltd., Calgary; Pte. David Evans Jones, Prov. Dept. of Public Health, Edmonton; Pte. Andrew J. Livingston, City Health Dept., Calgary; Pte. Wm. F. Lochead, Calgary; Pte. John MacDonald, P. Burns Co., Calgary; Pte. Ernest T. Phelps, Calgary; Walter G. Golding, City Health Dept., Calgary. The following candidates who sat for the April examinations have also been recommended for certificates: Pte. George Ernest Cottle, Provincial Dept. of Public Health, Edmonton; Pte. Edward Chas. Alexander, Provincial Dept. of Public Health, Edmonton; Pte. Jas. M. Jackson, City Health Dept., Calgary; Peter Maclean, secretary-treasurer, Gleichen.

It is interesting to note the excellent progress of the returned soldiers who have been trained at the Institute of Technology by the Vocational branch of the Invalided Soldiers' Commission. Some of these hold very responsible positions in the various health departments throughout the province, and during the past two months have rendered invaluable service in fighting the epidemic, especially in the rural districts. Many of them intend to pursue the higher course leading to the degree of R.S.

WHAT ARE CHANCES FOR BRAZIL'S TRADE?

Nearly all the electrical machinery now supplied to Brazil comes from the United States, although, before the war, a good deal was imported from Germany. The reason for Great Britain's poor showing can only be that our manufacturers have not sufficiently pushed the sale through suitable agents. The British Chamber of Commerce of Sao Paulo will be glad to place British exporters of electrical machinery, or any other goods, in touch with the right class of agents.

Files

The Americans have captured the file trade. Some years ago the files were supplied from Great Britain, but the Germans took the trade away in spite of the poor quality of their goods. The Americans followed the lead of the Germans, but produced a better quality file, with better packing, and captured the trade. Customs duties on files are paid according to weight; consequently the demand is for what is now known as "light weight" files. The Americans pack their files in neat cardboard boxes of half-dozen, dozen or more, depending on the sizes, whereas British makers continue to wrap their files in paper parcels in the old-fashioned manner, which parcels get torn in transit, the ends of the files stick out, rust and generally are less easy to handle.

SIZE OF COAL A FACTOR

In burning hard coal, the size should be carefully considered. Generally speaking, it is cheaper to use the finer grades, and in many plants "buckwheat" and "dust" coal are burned successfully and with good economical results. The main objections to the smaller sizes are that a much better draft is required to draw the air through the fuel-bed, and that a larger fraction of the coal is likely to fall unconsumed through the grates into the ash-pit, and so be wasted. To burn the smallest sizes with success, the draft should be powerful, and the grates should be chosen only after consultation with an experienced engineer who is familiar with the problems that are involved. Experimenting with very fine coal, without experience or competent advice, is likely to be expensive.

VOL. XIII. JANUARY 15, 1919 No. 2

INTERESTING AND VALUABLE INVESTIGATION

FOR some time SANITARY ENGINEER has been giving a lot of valuable data on pipe corrosion, etc. In the first place, it was reported that in quite a large number of buildings in which wrought iron pipe had been used it had given way and rusted through, etc., joints had broken at the threads, and so on.

These complaints came to us from a number of sources, and we therefore took no small amount of interest in the question. We secured pieces of corroded pipe from several sources and were given to understand that this pipe was wrought iron. We were furnished with copies of specifications which distinctly called for wrought iron pipe, and the architects were also given to understand this, or at least were not informed of the fact that other than wrought iron pipe was being installed.

However, the question became so very interesting, and of such value, both to manufacturers, supply men and members of the trade, that in a number of districts some very interesting tests were made. In Chicago, the sanitary engineering department at the city hall undertook to make a thorough investigation, and in New York, an investigation was conducted too.

The former investigation was conducted by Thos. J. Claffy, the assistant chief of the department. Mr. Claffy is a practical trained plumber and sanitary engineer, and has a staff of assistants, we believe, about the second largest in the world. Photographs were taken and data properly compiled, and as a result of this investigation much real matter was collected. SANITARY ENGINEER has been very fortunate in being able to procure the complete report and all the photographs, all of which appear in another portion of this issue.

Now, when SANITARY ENGINEER became interested in this question, it took it up with a view of showing that only such material should be used as was proving, by practical everyday experience, to be the best to use. Pipe was being sold and bought by the readers of SANITARY ENGINEER with the idea it was wrought iron pipe. But upon going into the matter SANITARY ENGINEER found that a lot of such pipe sold was not wrought iron pipe, but was pipe of inferior quality—in fact was made of a very doubtful mixture. There was also pipe sold that was and is steel pipe, and most of the samples of pipe sent in to SANITARY ENGINEER as wrought iron pipe turned out to be steel pipe. Of course this at once cleared the air. We have no doubt that this pipe of questionable quality has been the chief cause of the trouble, and therefore, we hope our readers will read the article which appears in another part of the magazine very carefully. We also hope that readers of SANITARY ENGINEER will refrain from installing any kind of material that cannot be depended upon to give maximum service, and we recommend that when buying black or galvanized iron pipe, wrought iron pipe be not only specified, but demanded. This is the only way to ensure the best results. When ordering pipe do not be satisfied to state, say, 500 feet of 1-inch B.I. pipe, or 500 feet of 1-inch galvanized pipe, but 500 feet of black wrought iron pipe. Furthermore, we would be very pleased to receive any information on this matter, so that cases of error, if any, can at once be nailed on the head. If a few of our readers, when ordering pipe, would send us a copy of their order and a sample of the pipe they receive, SANITARY ENGINEER will be only too pleased to have tests made. It has been proved without doubt in the investigation that steel pipe is not fit material for soil waste and drainage pipes, or ventilation pipes to soil waste and drainage systems.

TAKING PERSONAL STOCK

WITHIN the next few weeks many sanitary and heating engineers all over Canada will be taking stock. In doing this every member of the craft should not fail to take stock of himself, his men, his shop and the conditions of the tools his men have to use day by day. Some proprietors have found on looking into the matter that they are neglecting executive work which needs their urgent and personal attention to take care of work that could be done just as well by cheaper help. Others have found that other methods than those they were using are being applied by leading firms to boost business. Others have discovered opportunities for developing side lines which have turned out to be most profitable business builders. All these things are

worth looking into. Are you a better or more efficient salesman than you were a year ago? Are you keeping as closely in touch with your community and its needs as you should? Can your shop methods or the methods followed out on the job be improved? Stock-taking of this kind will often reveal points where improvements can be made that will make for increased business efficiency.

GERMANY'S LATEST PLAN

WHILE no attempts have as yet been reported since the signing of the armistice to unload German made goods in Canada, it is regarded as quite likely that some cleverly disguised plans for doing this are under way. It is believed that German agents are still very busy across the line and the American Defense Society has issued the following: "The subtle agents of Germany are here to place German goods on the market and ultimately undersell our own manufacturers. We have fought Germany on land and sea and now have to fight her at home. The cheap goods from Germany are made at slaves' wages. We must protect our own industries in order to give employment to our returning soldiers," Backing up this line of action several thousand stores, among them some of the largest in the States, are displaying signs which read "No German Made Goods Sold Here." In New York city alone, these signs are prominent in over 700 stores. There have been many rumors that German firms were not prepared to give up their foreign trade and would resort to every sort of scheme to unload their goods. It might be good policy for Canadian retailers to keep a weather eye open for German made goods.

Current Events in Photograph

BOOTY TAKEN FROM THE HUNS

Enormous quantities of supplies of all kinds have been falling into the hands of the British, French and American troops. At many points the Germans, encouraged by their successes in the early spring, concentrated millions of dollars' worth of war material of all kinds, intended for distribution among their men as they advanced. The Allies, however, have struck so hard and so often that in many cases these supply depots have had to be abandoned. Huge quantities of materials have been burned so that they would not fall into the hands of the advancing Allies. Other supplies have been blown up but in spite of all this the booty collected by the British and French is enormous. The photo shows some of the huge piles of war supplies that were taken undamaged.

War Time Plumbing in U.S.A.

Some Drastic Measures Adopted—Sanitary Plumbing Codes Not Recognized—By-laws Have to Go by the Board—Health Acts No Factor of Safety—Canada Must be Aware of the Bulk and Speculative Contractor

ABOUT five months ago we were at war, every country was trying its level best to conserve material of use for war purposes, and rightly so. The United States War Industries Board took some very drastic steps to conserve metals, without regard for municipal or state plumbing by-laws and all that these laws meant to the health of the people. No seamless tube was allowed to be made, or any tube of any kind heavier than 20 to 22 B. & S. gauge. No vented traps were to be made and no traps vented at all—all with a view of conserving brass and copper.

The sanitary plumbing trade was thrown into a panic, and not a few small municipalities, we have learned, were quite ready and willing to let plumbing by-laws go by the board. The War Board had to build thousands of houses for war workers. These were designed with cost as first and last thought; sanitary plumbing, we have been informed, was nil. While we sympathize with the spirit of the Board, we cannot say that the move was at all a practical one.

The following schedule to U. S. manufacturers of plumbing goods will, no doubt, be interesting to a great many of our readers:

CONSERVATION DIVISION
WAR INDUSTRIES BOARD
WASHINGTON, D.C.

Schedule for Manufacturers of Tubular Plumbing Goods, Covering Traps, Wastes and Overflows, Basin, Tank and Bath Supplies, Made of Brass Material, and Their Accessories.

1. No new styles, sizes or gauges to be made during the period of the war by any manufacturer.

2. **Wrought Traps** to be limited to the following styles, sizes and gauges:

One Style Plain P Trap with cleanout in 1¼ inch size.

One Style Plain S Trap with cleanout in 1¼ inch size.

One Style Sink Trap in 1¼ inch, 1½ inch, and 2 inch sizes.

All the above traps may be furnished with wrought or cast P. O. Plugs or wrought sink couplings.

All the above traps to be furnished in 20-gauge brazed tubing only.

All the above traps to be made with washer joints only.

3. **Cast Traps** to be limited to the following styles, sizes and gauges:

One Style Plain P Trap with cleanout in 1¼ inch size.

One Style Plain S Trap with cleanout in 1¼ inch and 1½ inch sizes.

One Style New York Regulation Trap with cleanout in 1¼ inch, 1½ inch and 2 inch sizes.

One Style Bag Offset Trap with cleanout in 1¼ inch and 1½ inch size.

One Style Bag Offset Trap with I P outlet with cleanout in 1¼ inch and 1½ inch size.

All the above traps may be furnished with wrought or cast P. O Plugs or wrought sink couplings.

All the above traps to be furnished in 22 B & S gauge brazed tubing only.

All the above traps to be made with washer joints only.

4. **Connected wastes** and overflows to be limited to the following styles, sizes and gauges:

One Style adjustable all wrought fixture, including wrought top and bottom strainers and wrought nuts made 1⅜ inch O. D. brazed tubing 22 B. & S. gauge.

One Style adjustable all cast fixture, including cast top and bottom strainers and cast nuts made 1⅜ inch O. D. brazed tubing 22 B & S gauge.

All Styles and sizes of Ideal or Bi-Transit wastes and overflows to be discontinued.

5. **Basin Supply Pipes** to be limited to the following styles, sizes and gauges:

⅜" **I.P.S. straight basin** supply pipes to the floor, 12 gauge brazed tubing, 26½" long, threaded on each end.

9/16 O.D. straight basin supply pipes to the floor, reduced on one end to 7/16 O.D., not threaded on either end, complete with coupling nuts, friction rings and rubber washers, 16 gauge brazed tubing.

⅜" **I.P.S. angle basin** supply pipes to the wall. 12 gauge brazed tubing, threaded on both ends.

9/16" O.D. angle basin supply pipes to wall, reduced on basin end to 7/16" O.D., not threaded on either end, complete with coupling nuts, friction rings and rubber washers, 16 gauge brazed tubing. Straight Crawford connection. Angle Crawford connection.

All the above ⅜" I.P.S. supply pipes to be furnished with reducer. All the above supply pipes to be furnished with heavy flanges.

6. **Bath Supply** Pipes to be limited to the following styles, sizes and gauges:

½" **I.P.S. straight** bath supply pipes to the floor, threaded on each end, 20½" long, 12 gauge, brazed tubing.

9/16" O.D. offset bath supply pipes, 16 gauge brazed tubing, complete with coupling nuts, slip nuts, friction rings and rubber washers.

All the above ½" supply pipes may be furnished with ball offset couplings.

All the above supply pipes to be furnished with heavy flanges.

7. **Supply Pipe for Closet Tanks** to be limited to the following styles, sizes and gauges:

One style tank supply pipe made of ⅜" I.P.S. brazed tubing, 12 B. & S. gauge, 21" long, threaded on one end, collar formed on other end, furnished with heavy flange.

Now, if no other material of such styles and gauges were allowed to be made, it will be plainly seen that any plumbing installation in which such goods are used cannot possibly be in keeping with good practice, and if the reader could have been present at the annual convention of the American Society of Sanitary Engineers, he would have realized just how those members present felt in regard to such drastic rules laid down by the War Trade Board.

In this connection SANITARY ENGINEER is of the opinion that an account of some of the discussions which were held will not be out of place here.

Mr. Rainger, one of the members present, addressed the acting chairman, Mr. L. A. Cornelius, as follows:

"Mr. Chairman, I don't believe that the War Industries Board will ever issue orders directly to the municipalities on that subject. I have received no orders, or had not until I left, to do anything but that which our city ordinance has provided should be done. And until I do receive some direct orders, I expect to live up to the city ordinances."

Acting Chairman:—"I might state that the general plan of the War Industries Board was to handle all such matters through organizations, where they existed, as for instance in the case of pipe manufacturers, who have their organization. There were five representatives chosen for the brass dealers, and two other gentlemen who were supposed to represent the brass goods manufacturers.

"Now, this thing is so vast, so large, and so far-reaching that should the War Industries Board attempt to get in touch with every manufacturer individually, in order to get his views, the war would be over before the Board came to any conclusion. At any rate, that is the method they have taken to operate in groups as far as possible.

"In speaking of, for instance, the point brought up by Mr. Rainger, I quite agree with him in not believing that the U. S. Federal Government will send any mandatory rules to the various Boards of Health. As a matter of fact, the Federal rights, State rights, and Municipal rights, as we had occasion to look up two or three years ago, are a pretty delicate subject to go into and say you can do this and you can't do that, and that is one of the obstacles of a Federal code, because a Federal code, under normal conditions, at least, could not be mandatory.

"Now, it may or may not be quite clear to you as to how the War Industries Board really enforces these rules. I do not believe there is any penalty—direct penalty, at least, to any one or to any concern for a violation of these acts that we have read, except this:

"No manufacturer, of course, can produce without his raw material. All the raw materials are directly controlled by the War Industries Board. There is not a rolling mill of steel, brass or copper but what there is a Government official there who must O.K. all the products that go out of that mill.

"In practical working, therefore, it resolves itself into this: A manufacturer writes to his mill for certain tubes or sheet, etc., etc., and he must specify exactly what that material is to be used

for, whether it is for direct Government contract or not, etc.

"If it is for the making of, for instance, brass traps, and he orders 17 gauge, and this rule says 20 or 22 gauge, then he is not going to get material, and furthermore, if any manufacturer does not co-operate, he not only will not get material he asks for, which is not in keeping with their rule, but he won't get any material at all.

"Now, this rule, as I said before, is not mandatory, but it is about as mandatory in working it out, commercially speaking, as if the gun was at your head and you had the option of obeying or not. In its real action it is so, and I think it should not be. This is not criticism, it is a matter of fact. And that procedure, you can see, does not conflict with or bring into discussion the matter of codes and various municipal rules. The Industrial War Board simply control the material.

"If any city refuses to allow the use of material that is available, all right, they can get along without material—a very pleasant option—but that is the practical working out of the system."

Protests to War Board

There then followed considerable discussion on the matter, and in committee a resolution was drafted to be sent to the War Industries Board, which read as follows:—

Subject, Plumbing Goods

"Gentlemen: The resolution of the building material section, dated Sept. 27th, and the schedule for manufacturers of tubular goods, dated Oct. 1st, have both received the attention and consideration of our membership.

"We are in full accord with any and all conservation measures which are rendered essential by our war activities.

"We realize that modifications and changes will be made in your rulings from time to time, in accordance with conditions and facts as presented to you and our war necessities.

"We have labored for years, and with considerable success, for the establishment of sanitary codes embracing standards for material and practice, that make for safe and lasting protection.

"Doubtless it is superfluous to state that your recent decisions, first above referred to, do not embrace material and practice that under normal conditions would meet with our approval.

"Lowering standards, irrespective of the present excellent reason, will compel a considerable amount of executive and educational work later, when our industrial situation is normal.

"We shall earnestly endeavor to render all possible assistance in carrying out both the spirit and the letter of your instructions, and at the same time conserve as far as possible the comfort and health of the American people.

"In the after-war period we may request equal co-operation of the Government in the re-establishment of standards that make for satisfactory and permanent protection to health and life."

Readers, Please Note the Following Discussions

Acting President: "What is the action of the resolutions committee on the resolution?"

Mr. Walker: "The action of the resolutions committee was to send a protest to the surgeon general on the quality of materials that the United States Housing Commission are installing in governmental houses. We feel that those houses are to be built, and as they are a menace to the health of their occupants, it seems to us just and proper that we should protest."

Mr. Devine: "I would state that we feel that, as far as the housing proposition is concerned, we, as members of the American Society of Sanitary Engineers, should not go on record as having been willing to lower the standards, believing, as we do, that these houses later on will become part of the individual localities in which they are built The possibilities are that they will be sold to citizens and taxpayers, and we feel that we should be placed in no position whereby later on we might be blamed in any way for any menace or ill-health occasioned or created by any lower standards recommended by us."

Mr. Mullen: "I think that the resolution which Mr. Walker read would be well enough to send to Washington, and while we are in accord with conserving as much as possible, I don't think we should conserve so far as to put the life of any occupant of a house in danger.

"The country is spending millions of dollars for many things not half as essential as good plumbing, and it would be far better to put in a good class of plumbing and cut out some of the non-essential things they are using."

Mr. Tweedy: "I know something of the construction being done on the housing development. It is a crime to anyone who has served the best part of his days in the plumbing business to see the class of plumbing that is being installed to-day by our Government. The housing scheme, as financed by the Government, is simply this: The houses are being built with the idea that at the end of the war they intend to sell those houses to the people who are going to work in those plants or in the vicinity of those plants.

"There is no vent or loop vent system, and everything they put into those houses is a necessary trap. I want to refer to two jobs in particular which I know something about. There is not a house on any of those Government reservations to-day that does not pull its own seal.

"You were told on this floor yesterday by a doctor of the United States Army how careful they are in preserving the health of the soldier and sailor. Evidently they have lost sight of the man who works in the shops and factories, and who toils with the tools. His health, I suppose, is not regarded. It should be regarded. He is just as important and has just as much right to protection as anyone else.

"I know of one case where there is a laboratory of a hospital in which a fixture is installed; the length of the waste pipe from the trap is thirty-five feet, and without a vent. In that same hospital four lavatories are installed, all the trap seals are broken every time the fixtures are used, and sewer gases enter the hospital from all the fixtures.

"I firmly believe that we should go on record at this convention, complaining of the plumbing installations being endorsed and constructed by the United States Government in their housing scheme."

Mr. Rainger: "Mr. Chairman, I take it that there is not a man in this room or within sound of my voice who is not a good loyal supporter of our Government.

"All of us here have given freely of our substance. A great many of us here have given our sons in the prime of life, to the end that this war may be carried to a successful issue. I believe that if the attention of the powers that be in Washington is called to these conditions in a logical way, by a society of the standing in the country that this society has, the Government will see fit to revise the order and to eliminate most of the objectionable features.

"The houses are going to pass into private ownership after the war. Along comes the plumbing inspector, backed by the city ordinances, and says to the owner of one of these houses, who has bought this house in good faith, supposing that the Government of this big United States knew what they were doing when they installed the plumbing in that house—"This installation is defective. It is dangerous to your health and the health of your family. We must compel you to re-install this plumbing system in accordance with our ordinance."

Other Members Spoke in the Same Strain

Quite a number of other members spoke in the same strain, and one referred in particular to the plumbing work installed in one of the great naval stations situated on the Great Lakes, "Which," said he, "will convince everyone present that the work is not safe or sanitary, but just the opposite."

One thing we in Canada, at least, can boast of and that is, any camp of any size has been equipped with a very fair type of plumbing work. Camp Borden is a model fit for anyone to see.

Mr. Lee, of Pittsburgh, was very much surprised to hear of such botch work. He declared that all houses built by the Government in his city were properly equipped with plumbing in accordance with their city ordinances.

Watch Canada's Housing Schemes

Now, here we are in Canada about to launch into one of the biggest and most important domestic schemes ever attempted. Everybody is thinking in terms of dollars and cents and first cost

of building houses. They think in cash investments and not in health insurance These dollar-and-cent men think that it is more desirable to have cheap houses, or houses built at a price that will bring cash profits, rather than to have comfort, health and greater producing power for the occupants of those houses.

Only a few years ago, comparatively, builders and owners of houses held up their hands in horror at having to install water closets in a home. There are hundreds of houses, if not thousands, in Canada to-day where no wash basin or bath tubs are installed. And if the same class of speculators are allowed their own way, they would go back to those times. We sanitary engineers must be heard. We must plead our cause, as it were, by advertising in the public press. We must show the public that good health is the only investment worth while. We must take up and answer such articles as convey to the public mind that sanitary plumbing is too costly, or can be simplified to a degree that would make it dangerous to the occupants in which such plumbing is installed.

The following is an extract from a Toronto daily paper, which should have been taken up. But, no, the public are being led to believe that wonderful things are being accomplished, that traps do not need to be vented, etc., and pipes in plumbing systems are, as a general rule, too complicated.

Thousand New Homes Under Construction in Portsmouth, Says W. S. Post

William S. Post, of New York, has had more to do with the solution of the housing problems under the United States Housing Bureau than any other single individual. In an interview with the "Star," he outlined the scheme which is successfully meeting the situation in Portsmouth and Norfolk, U.S.A., where the growth in population during the past few months has been enormous.

The situation demanded one thousand new homes in Portsmouth and 560 in Norfolk, but since the signing of the armistice the Norfolk scheme has been discontinued and may be abandoned. At the time of the first draft Norfolk had a population of 86,000, but the draft was made on the basis of 105,000 and to-day the population is stated to be more than 200,000.

Outside the limits of the city of Portsmouth a model town is under construction, untrammeled by the restraint of old developments or other ordinances and will be built up and managed along thoroughly scientific lines. Lots were laid out averaging 50 feet wide by 100 feet deep and six-room frame houses built, with a minimum space between houses of 16 feet. There are a few units of five or six houses, but 80 per cent. are detached.

Following English Plan

These houses are being built with the side to the street, the roofs running with the street line. Thus there is more circulation of air and better living conditions generally. The plans followed closely resemble the best examples of town planning in England, the central portions, however, being somewhat more regular than is the case at Weldhall and Gretna, the new "war towns" in England.

It has been possible also to give better housing conditions as regards parlors and a standard plan has been devised for each of the 50 different designs. **There are but four types of bathrooms and the heating systems have been planned in such a way that they can be made up in advance and simply installed when the house is ready. Simplified plumbing systems have been installed, doing away with 50 per cent. of the piping and eliminating altogether the back air vent.**

Demand Enormous

"The Government is spending $40,000,000 on this engineering base," Mr. Post said, "and the business being done, according to latest reports, is second only to that of New York. The demand for houses is enormous and the attitude of the Government has been to go on with only that work that was absolutely demanded. All other industrial construction of houses stopped."

The new town has been named "Craddock," after the British Admiral, the first to lose his life in the war, and the streets will be named after United States navy officers. "It is to be a thoroughly navy town," Mr. Post observed. "The expected cost of each house is $3,000 and the lots will not be more than about $80 each without the cost of local improvements."

"Could this type of house be used in Canada?" he was asked.

"Undoubtedly," Mr. Post replied. "Each is equipped with a complete hot water heating system at that price."

However, such schemes should, as we stated before, be watched with no small amount of suspicion, because, if plumbing is not well installed, and if good material is not used, the condition of such plumbing and heating will be such as will keep a lot of men forever repairing, and the trade will again be looked upon as having made work for themselves. But if we, as a craft, insist that all work installed by us is first class, that none but practical men do the work, that only good material is used, and that all jobs are properly designed, then no such statements can be made and the work will be a lasting credit to all who interest themselves in good plumbing and proper heating installations.

DANGERS OF STORING COAL

Coal deteriorates to a sensible extent upon exposure to the weather, and supplies that are held in storage should therefore be covered by a shed or roof that will afford a proper protection. Coal that is closely confined is likely to grow hot, below the surface, and good ventilation of the bins is therefore desirable, so that the coal may be aerated and cooled as thoroughly as possible. The heating is doubtless due to the slow oxidation of impurities, and under some circumstances it may be rapid and intense enough to set the coal afire—a phenomenon known as "spontaneous ignition." Fires sometimes originate in this way, deep down in a coal pile, and smolder, unsuspected, for a long time. They are often very hard to extinguish. To guard against the indefinite spread of fires in the coal pile, whether they are of spontaneous origin or not, the bunkers should be divided at frequent intervals into entirely separate pockets, by substantial walls of brick or other noncombustible material, especially if coal comes from mines the output of which is known to be especially prone to self-ignition.

IMPORT AND EXPORT RESTRICTIONS WITH BRITAIN REMOVED

Important cable dispatches have been received by Mr. G. T. Milne and Mr. F. W. Field, the British Trade Commissioners at Montreal and Toronto respectively from the Imperial Department of Overseas Trade in London, pointing out that since the armistice was signed many restrictions on commerce have been withdrawn, while in the case of those which remain, licenses are being granted much more freely than previously. Particulars regarding these relaxations will be published weekly in the "Board of Trade Journal," the official organ of the Imperial Government for notices regarding trade.

Orders placed during the war period now have good prospects of being executed, and arrangements for new business should be made without delay.

The following relaxations in particular should be noted:

1.—Permits to manufacture and priority certificates in connection therewith are no longer necessary.

2.—Firms are at liberty to accept civil or commercial orders for immediate execution, thus freeing the engineering industry among others for commercial work.

3.—All the principal kinds of raw materials may now be used for the commercial manufacture of goods for export, but these raw materials themselves may not be exported in certain cases without licenses. Among those to which this condition applies are the following:—Aluminum, brass, iron, nickel, steel, antimony, copper, lead, spelter or zinc, tin.

In general, restrictions on the export of manufactured goods have been removed, while they have been retained in the case of raw materials.

The following list indicates the most important items, the export of which was formerly prohibited to all countries but are now permitted to be exported to any part of the British Empire: Articles of aluminum; articles, manufactures of asbestos, belting, cotton, including belting impregnated with balata or rubber; copper, and manufactures of, except wire bars, plates, rods, sheets, strips, tubes; galvanized sheets, corrugated or flat; grindstones; hollow ware, domestic, or iron or steel plate; iron and steel rivets, nuts and screws; iron and steel wire cloth; incandescent mantles and rings; magnesite and magnesite bricks; rubber manufactures. except surgical gloves; steel sheets (black); tools (small).

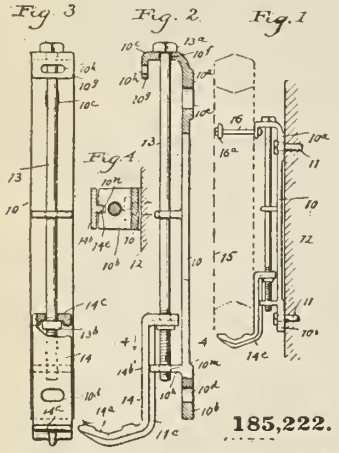
Certain factors will continue to hamper the export trade, notably: (1) shortage of labor till the army is demobilized; (2) shortage of tonnage; (3) the need for reorganization of plant in certain industries before resuming normal work, but it is considered that the effect of these factors will diminish greatly in a few months.

New Canadian Patents

No. 185,222

George I. Chittenden, Lakewood, Ohio, U.S.A., 2nd July, 1918; 6 years. Filed 27th April, 1918. Receipt No. 294,245.

Claim.—1. A hanger for a wall radiator comprising a bracket adapted to be secured to a wall and having laterally projecting portions, a bolt passing freely through the laterally extending portions of the bracket, a radiator seat having a lower radiator engaging portion and having a portion extending upwardly



Hanger for Wall Radiators.

therefrom and adjustably connected to the bolt between the laterally extending portions of the bracket.

2. A hanger for a wall radiator comprising a bracket adapted to be secured to a wall and having outstanding portions, a bolt passing freely through these portions, a lower radiator seat having a portion adapted to engage the lower part of the radiator and having an upwardly extending part with an opening through which the bolt freely passes, a nut on the bolt held from turning by the seat and supporting the seat, said nut being located between the outstanding portions of the bracket.

3. A hanger for wall radiators comprising a bracket adapted to be secured to a wall and having laterally projecting ears, a bolt passing freely through both ears, a radiator seat having a radiator engaging portion beneath the lower ear, and having a portion extending upwardly past the lower ear and adjustably supported on the bolt between the ears, the upwardly extending portion of the seat and the lower ear having interfitting guiding portions.

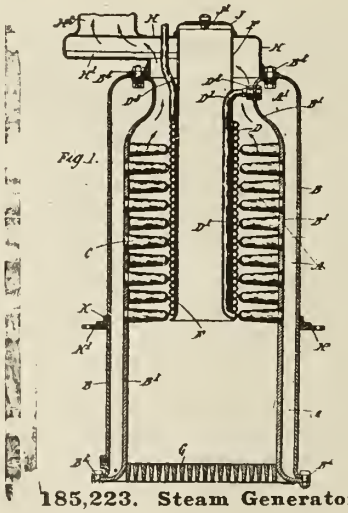
4. A hanger for a wall radiator comprising a bracket having upper and lower outwardly projecting ears, a bolt passing freely through the ears and provided with an adjustable nut between the ears, a radiator seat having a lower portion which is beneath the lower ear of the bracket, an upstanding portion which extends past the lower ear, and an inwardly extending portion through which the bolt passes, and which rests on said nut, the upwardly extending portion of the seat and the lower ear of the bracket having interfitting portions.

5. A hanger for a wall radiator comprising a bracket having outwardly extending ears, the upper ear terminating in a down turned lip, constituting a side bearing portion for the radiator, a bolt extending freely through both ears, a lower radiator seat adjustably connected to the bolt between the ears, and means passing through said lip and adapted to extend through the radiator for passing the radiator against said lip.

No. 185,223

Thomas Clarkson, Chelmsford, Essex, England, 2nd July, 1918; 6 years. Filed 30th June, 1917. Receipt No. 281,635.

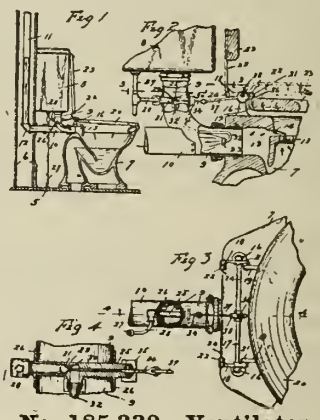
Claim.—1. In a steam generator for a motor road vehicle the combination of an annular water chamber, straight tubes radiating inwardly therefrom and having closed ends, a superheater coil adjacent to the inner ends of said tubes the space between the superheater coil and the annular water chamber forming an annular combustion chamber through which the tubes pass and a grate for solid fuel below said tubes on to which grate the fuel can pass down through a central chamber surrounded by the tubes.



185,223. Steam Generator.

2. In a steam generator for a motor road vehicle the combination of an annular water chamber, straight tubes radiating inwardly therefrom and having closed ends, a superheater coil adjacent to the inner ends of said tubes the space between the superheater coil and the annular water chamber forming an annular combustion chamber through which the tubes pass, a grate for solid fuel below said tubes and a shield within the superheater coil forming a passage or conduit down which solid fuel can be fed on to the grate.

3. In a steam generator for a motor road vehicle, an annular water chamber formed between two substantially cylindrical walls connected by flanged joints at the top and bottom, straight tubes radiating inwardly from the inner wall of said tubes having their open ends communicating with the annular water



No. 185,339. Ventilator.

chamber and their inner ends closed, a superheater coil adjacent to the inner ends of said tubes, the space between the superheater coil and the annular water chamber forming an annular combustion chamber through which the tubes pass, a grate for solid fuel below said tubes, a shield within the superheater coil forming a passage or conduit down which the solid fuel can be fed on to the grate, a cover closing the space at the top of the cylindrical walls, such cover having an opening through which the top of the central shield passes, and a removable cover for the upper end of said shield.

No. 185,339

William M. Anderson, and Nels Bruce, assignee of a half interest, both of Minneapolis, Minnesota, U.S.A., 2nd July, 1918; 6 years. Filed 19th February, 1918. Receipt No. 291,167.

Claim.—1. The combination with a closet bowl, a water supply, a ventilating stack and a single connection between the closet bowl, water supply and ventilating stack, of a spraying nozzle connected to the water supply located in said connection and arranged to direct a spray of water toward the ventilating stack.

2. The combination with a closet bowl, a water supply, a ventilating stack and a single connection between the closet bowl, water supply and ventilating stack of a water pipe leading from the water supply and having a spraying nozzle lo-

cated in said connection and arranged to direct a spray of water toward the ventilating stack, a valve interposed in the water pipe and incorporated in said connection, and means for opening and closing the valve.

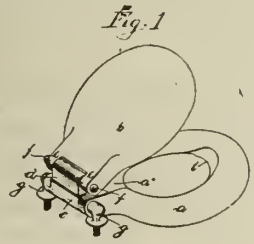
3. The combination with a closet bowl, a water tank, a water supply pipe leading to the water tank, a ventilating stack and a flushing bend connecting the water tank and closet bowl, said bend having an extension connecting the delivery end thereof with the ventilating stack, of a valve casing interposed in the flushing bend at its receiving end and connected to the water supply pipe, a normally closed valve in said casing, a water tube leading from the valve casing and having a spraying nozzle located in the delivery end of the flushing bend, and means for opening said valve.

No. 185,224.

George W. Collins, Holyoke, Massachusetts, U.S.A., 2nd July, 1918; 6 years. Filed 11th November, 1916. Receipt No. 271,883.

Claim.—1. The combination of a seat having a rearward extension, means for hingedly mounting said seat in place, an upward projection upon said seat, and a cover hingedly mounted upon said projection independently of the hinging elements of the seat and detachable therefrom at pleasure without impairing the sightliness of the seat or dismounting or exposing wholly or in part the seat hinging elements.

2. The combination of a seat having a rearward extension, means for hingedly mounting said seat in place, an upward projection fixedly applied to said rearward extension, a cover having rearward extensions adapted to engage said seat projection, and means independent of the seat hinging elements for hingedly connecting the seat projection and the cover extensions, whereby the cover may be detached and removed without affecting the seat hinging elements or impairing the sightliness of the seat.



No. 185,224. Closet Seat and Cover.

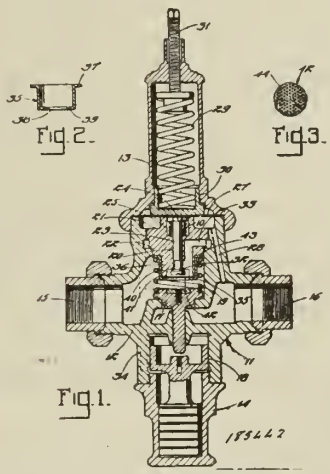
3. The combination of a seat having a rearward extension, hinge posts having pintles engaging said extension, a projection rising from said extension, a cover having rearward extensions aligned with the seat projection and provided with pintle openings, and pintles passed through the cover extensions and into the seat projection.

4. The combination of a seat (a) having a rearward extension (e), posts (g) adapted to be secured to the bowl and having lateral projections (j) entering openings in the part (e) adapted to receive them, a part (d) mounted upon and permanently secured to said rearward extension (e), a cover (b) having rearward extensions (c) and pivotal connections between the part (d) and the arms (c) all arranged and operating, substantially as shown.

No. 185,442

The Mason Regulator Company, Boston, assignee of George Sampson Melcher, Sharon, both in Massachusetts, U.S.A., 9th July, 1918; 6 years. Filed 3rd May, 1918. Receipt No. 294,471.

Claim.—1. A pressure regulator comprising a valve body having an inlet and an outlet opening, a partition between



185,442. Pressure Regulator.

said openings having a hole therethrough, a main valve controlling the passage of fluid through said partition, a piston for opening the main valve, and a spring for operating it in the other direction which tends to close the main valve, said body having a communication port between said inlet opening and said piston, an auxiliary valve controlling the passage of fluid through said communication port, means for operating said auxiliary valve, and a housing about said auxiliary valve having a strainer therein, said main valve spring being interposed between said main valve and said housing whereby said housing is secured in position.

2. A pressure regulator comprising a valve body, a main valve controlling the passage of fluid through said body, a plug at one side of said main valve, a piston by which said main valve is operated in one direction, a communication port through said plug and valve body whereby the fluid passage through said valve body is connected to the piston, an auxiliary valve located in said plug which controls said port, means for operating said auxiliary valve, a housing which encloses said auxiliary valve and surrounds a portion of said plug and has a hole therein, a strainer disc over said hole, and a main valve spring by which said housing and said strainer disc are held in position.

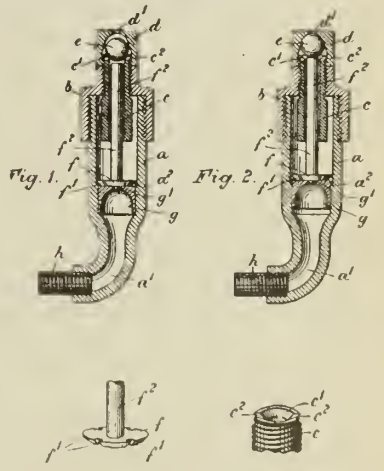
3. In a regulator of the class described, the combination with a main valve, opened by a piston, of a plug located above the main valve, an auxiliary valve located in said plug and controlling the flow of fluid to said piston, a housing surrounding a portion of said plug and having a flange thereon which rests against the same, a strainer disc in said housing, and a spring surrounding said housing and bearing at one end against said flange and at the other end against said main valve and thereby operating to tend to close said main valve and to hold said housing in position.

4. In a regulator of the character described, the combination of a main valve which is opened by a piston, of an auxiliary valve which controls the flow of steam to said main valve piston, a diaphragm which controls said auxiliary valve, a plug in which said auxiliary valve is located having a recess therein with a flange surrounding the recess, a strainer housing which surrounds said flange, an annular flange on said housing, a strainer disc between said housing flange and said plug flange, and a main valve spring interposed between said housing and said main valve which operates to tend to close said main valve and to hold housing and strainer disc in position.

No. 185,361

John Callicott, Toronto, Ontario, Canada, 9th July, 1918; 6 years. Filed 28th November, 1917. Receipt No. 288,115.

Claim.—1. A device of the class described comprising a ball casing having an outlet orifice therein, a ball within said casing, a plunger casing communicating with said ball casing and having an inlet orifice therein, and a plunger slidably accommodated within said plunger casing, said plunger being adapted, when raised, to move said ball to close said outlet orifice, and said ball



185,361. Check Valve.

being capable of retention in such closing position at a lower pressure than that required to raise said plunger.

2. A device of the class described comprising a ball casing having an outlet orifice therein, a ball within said casing, a plunger casing communicating with said ball casing and having an inlet orifice therein, a plunger slidably

(Continued on page 48)

Create New Business This Way

Cultivate New Acquaintances, be a "Mixer"—Let These New Friends See That You Are Interested in Their Welfare—Making the Store Window Work—Planning For 1919 Business

SINCE the eleventh of November last, and after the excitement accompanying so joyous and so unexpected a termination to the Great War had died away, I have been thinking of reconstruction. Not that I expect to be bidding upon contracts for heating or plumbing in a large way for some little time, for, of necessity, there will be a period of readjustment. Conditions that required the harnessing of every resource and every effort in a great scheme to stem the tide of a powerful and insistent enemy, cannot be changed over in a day. And so great and unexpected was the surprise to the whole world, brought about through the agreement upon an armistice, that we have had to stop and pause. As if waking from a prolonged nightmare, one has had to get his bearings and just decide where he is at.

I believe that there is a great opportunity ahead for the sanitary and heating engineer. Had I not thought so, the anxious times of the past four years would long since have decided me upon a different vocation and my shop would have been closed and what equipment and stock I possessed would have been sold to the highest bidder.

In deciding to stay with my ship of business I figured that the growth of my city, though still a small one, would justify my holding on. I have done so. It is a poor business that will not bring its owner a decent living. By keeping on the job faithfully over the period of the war I am glad to say that I have been able to keep things going and to make a fair living for my wife and family. From now on I propose to make more than a mere living. Opposition or no opposition, I am going after all there is for me in the days to come.

The winter season is not a good time in which to look for big business in so extreme a climate as Canada—not from the standpoint of the sanitary and heating engineer. But it is a good time to make plans. And this is what I mean to do this winter.

In the first place I am going to make up a list of prospective customers. In securing names that will be live and worth spending stationery and postage on I mean to do personal canvassing as much as circumstances will permit. This is my one big card. I know that it has been hard for me to call on men in the past and ask for a share of their work, but I can say this, that the more I cultivate the acquaintance of the citizens within my own city, the more friendly a great many of them are toward me. Not only so, but I have been taken into the confidence of these men frequently and have attained a position

Editor's Note—The writer has consented to outline his views to SANITARY ENGINEER readers as to what he proposes doing under the conditions which he expects will prevail soon, now that peace is assured. Others will at least be interested in this plumber's plans and may wish to adopt some of the ideas which he has planned for his own business.

of respect which I scarcely think would have been possible had I not made myself somewhat of a mixer. I say "made," advisedly and meaningly. For I, like many of my fellow craftsmen whom I know, was inclined to be retiring. It got me nowhere. In talking with friends from time to time I found that they made friends because they called on people and interested them in some way. I endeavored to be so myself, and in looking back over several years believe that I have made scores of good friends who would never have known me, nor I them, had not I got out of my rut and deliberately "cultivated" new acquaintances.

After making up my list of prospects I shall write them a good letter and say that I will be ready to furnish estimates for them on any work which they may have. I will further call upon them in quest of contracts. Many of them will contemplate either new buildings or the renovation of old ones. I shall show them that I am interested in this development and to prove my sincerity I propose to make a bid for their confidence by spending the time necessary to give them suggestions as to how their ideas may be most economically and profitably carried out. If possible, I will suggest alternate schemes. If it be a hot water job or steam, I shall prepare rough, but neat sketches of the system and give logical reasons why the plant ought to be laid out after my ideas. In making these suggestions I shall, of course, depend much upon the interest I have awakened in my prospect as to my sincerity in his behalf. But, notwithstanding this, I shall make it clear that he is at liberty to seek other plans and suggestions. This, I feel, will do me no harm, for it will indicate that I am willing that my prospect should see what others have to offer. I will, at the same time, be careful to keep in close touch with him and will also ask him to carefully investigate the suggestions of my competitors.

As heretofore, I shall also keep in touch with reliable contractors. I have always done my work well, and while some contractors have been very unreliable, I think that I know several of the honest ones on whom I can depend to be fair with me. If I can cultivate them, as I mean to do, they will surely give me an opportunity as readily as the other fellow. And just here I mean to make it my business to interview the owner and tell him honestly what he has a right to expect in his sanitary and heating requirements.

Of advertising I mean to do a considerable amount. This will be conducted wisely and as well as I know how. It will appear regularly in the local paper and each announcement will be a different one. I mean to use illustrations, and there are many of these that make up very nicely when the reading matter that accompanies them is simple and to the point.

I have a window to my shop. It is pretty dirty just now and not very well suited to the purposes of display. Last summer I let it accumulate a lot of dust and the fittings in it were not very attractive at the end of the month. I expect to spend about $100 on this in overhauling it and will drop the floor of it so that the people in passing can look into it without trouble. I will arrange to have a permanent backing in this window and most of the time I mean to show a model bathroom. This will have tiled wall paper at the back and no more fixtures than one would see in a well-appointed bathroom. There will be a towel rack at one end and a clean towel on this. I shall cover the floor window with a piece of good linoleum and place a bath mat in front of the bath. After all this is arranged I will have a neat sign ready, and this will read: "This is the model bathroom you have wanted. Let us estimate its cost for you."

Inside my shop I will make a neat display of tubs and closets, basins and slop sinks, and of other fittings. I shall also have an arrangement of furnaces, covered and uncovered, both hot water and steam. These will be painted up to show well when the customer is looking them over.

Altogether, I look for a gradual improvement in conditions and I purpose being ready for it. I intend to read my trade paper carefully, for I do not know it all and like to read what problems the other craftsmen have had. I am always glad to learn anything useful, and there are many patterns and ideas published which I am glad to study. I am out for a banner year in 1919.

Studying Big Problem.—A series of weekly lectures on "Industry, and the Problems of Reconstruction" are being given at the McGill University by Francis Hankin, who has made a special study of the relations of labor and capital from a business standpoint.

PRACTICAL SHEET-METAL WORK

THREE PIECE ELBOW WITH GUSSET OR GORE PIECE.

BY THOMAS STANSFIELD

IN this issue is shown a flared article, round at top, square at bottom, but with the base at an angle to the top, as shown in side elevation.

Draw plan as shown by A B C D, placing plan of top in centre, as shown by circle. Divide the plan of top into four sections, having the diameter drawn from the division parallel to the sides of base as described at 1 9 to A B. From each of these points draw lines to corner (see A B C D). From each of the divisions in the circle draw lines to the nearest corner, as between 1 5 to A and 5 9 to C, repeating same on the other two sections. The lines thus obtained form the bases of angles; the height of the angles at A and D is the straight height on elevation. From A to D, as shown by line E A, with E D as an altitude, and the different points A 1 to A 5 as bases form the angles shown at X A 1, thus obtaining the points X 1, X 2, etc., to X 5. The height of angles at B and C is equal to straight height between B C on elevation, as shown by B F, with B F as altitude and the points B 5 to B 9 as bases, form the angles shown at X B 5.

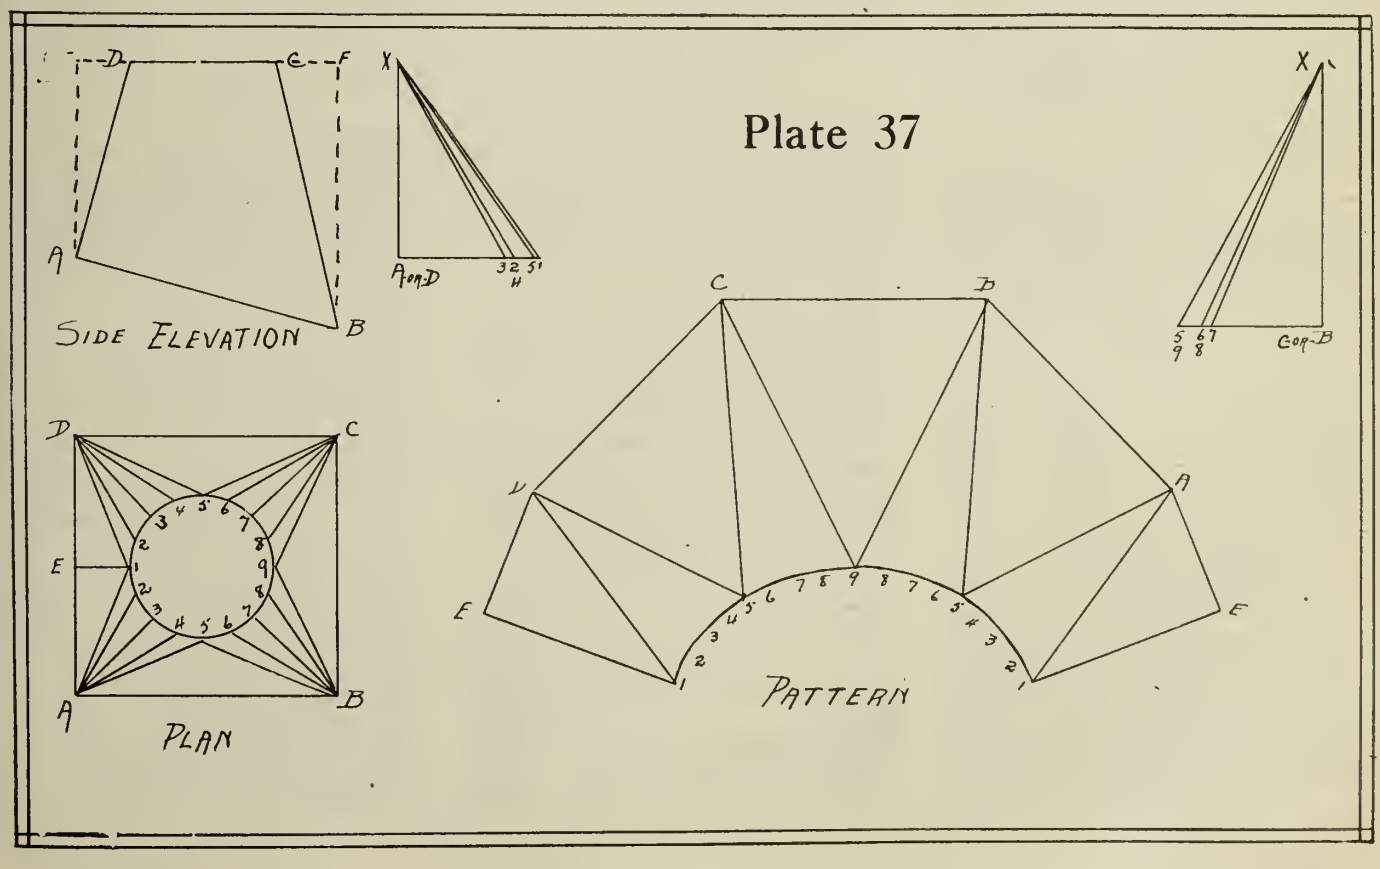
To lay out pattern, draw a line equal to D A on elevation, as shown by E 1. With E as a centre and E A of plan as a radius, then draw an arc. And with X 1 at angle A as radius and point 1 of pattern as a centre draw an arc intersecting the one drawn from E, thus obtaining point A.

With point A as a centre and the different points X 2, X 3, X 4, and X 5 at angles A as radii draws arcs intersecting each, as drawn with arc drawn from last point obtained, as from point 1, to obtain point 2, 2 to 3, etc., the radius of the arc being one division of circle in plan. When point 5 is obtained, draw lines joining A 5, with A as a centre and A B on elevation. As a radius, note that A B on elevation shows correct length A B, but on plan it does not; draw an arc. With X 5 at angles at B as a radius and point 5 as a centre draw an arc intersecting the one drawn from A obtaining point B.

Now draw lines, joining A B and B 5 With B as a centre and the different points, X 5, X 7, X 8, X 9, as radii, draw arcs intersecting each as drawn, with arc drawn from last obtained point, the radius being equal to one division of circle in plan. When point 9 is obtained, draw a line joining B 9 with B as a centre, and B C on plan as a radius draw an arc. With X 9 at B as a radius and point 9 on pattern as a centre, draw an arc intersecting the one drawn from B, thus obtaining point C.

Next draw lines joining B C and C 9, with C on pattern as a centre and the different points, X 9, X 8, X 7, X 6, and X 5, as radii. Then draw arcs intersecting each as drawn, with arc drawn from last obtained point, this arc having a radius equal to one division in circle on plan. When point 5 is obtained, draw a

(Continued on page 49)



Market Conditions and Tendencies

Statements Regarding Supplies and Trend of Prices

THE MARKETS AT A GLANCE

WROUGHT pipe has undergone a revision in price, the new quotations providing for a decline. This is in line with declines registered in basic materials and a gradual lessening of production costs through more efficient labor. Wrought steel shows the greater change in both buttweld and lapweld, the standard buttweld in genuine wrought iron, with the exception of two or three sizes, remaining unchanged. XX strong buttweld and XX strong lapweld remain at former price levels.

Boiler tubes, on which lower prices were expected, have not yet been revised. Jobbers are working on stocks which were bought at high levels, and it may be a little while yet before new prices are named. Supplies are now considered very good. A slight change in malleable and cast iron pipe fittings is recorded in some quarters.

The steady decline in pig lead has resulted in a further lowering of prices on lead pipe and lead waste. The present basis of quoting provides for declines of 1c per pound. A lower basis on tin, when combined with a similar situation on lead, might be expected to work out in lower solder, and this has been the case. Quotations to-day are below those prevailing a couple of weeks ago.

Ingot metals have shown comparatively little change the past couple of weeks. There is so little doing just now and there seems to be no way to determine exact values, so that one can hardly say what the market is. In fact, some authorities state there is no market, and until conditions readjust themselves to marked activity in peace-time pursuits, values will be difficult to name.

TORONTO, Jan. 13—Lower prices have been named on wrought pipe and a slight revision is noted also in some quarters of malleable and cast fittings. Lead pipe and waste are down another cent per pound, while other lines show little variation. The situation in regard to sheets and plates shows improvement, supplies coming through well. Business is seasonably quiet.

Range Boilers Holding Steady

RANGE BOILERS—There is a steady tone noticeable in the market on range boilers. There is only a fair amount of business offering just now, but this is carrying an unchanged basis of quotations which is as follows:

	Standard	Extra Heavy
30-gallon range boilers	$14.00	$17.00
35-gallon	17.00	20.50
40-gallon	20.50	24.00
52-gallon	28.00	32.00
66-gallon	37.00	42.00
82-gallon	45.00	50.00
100-gallon	62.00	70.00

Unchanged Position Holds in Enamelware

ENAMELWARE—No new developments are recorded relative to enamelware. The market is quiet and holding steadily with prospects considered very bright for business during the year. This will not show immediately, but it won't be long before spring comes and with it an increased volume of orders.

Bath-tubs, roll rim, 4, 4½, 5 feet, 24 to 30 in. wide	$32 10
Bath-tubs, 5½ ft.	35 70
Basins, flat back, 14 x 15 in.	6 00
Do., corner, 15 in.	5 95
Sinks, roll rim, 18 x 30 in., staple	16 80
Closets, oak tank and seat	27 00
Do., enamel iron or white vitro tank	29 00

Soil Pipe Stocks Low; Fittings Down

SOIL PIPE, FITTINGS—The market on soil pipe shows little variation. Stocks generally are low, but a gradually improving situation in regard to securing raw material and labor will, it is thought, overcome this to a great extent by the time business is again coming along actively.

New prices established in some quarters on fittings show a slight reduction, present quotations ranging as follows: Malleable and cast bushings, 18 to 20 per cent.; unions, 35 per cent., plugs, 15 per cent.; Class B malleable fittings, black, 26 to 27c per pound; Class C, black, 18c to 19c; Class B, galvanized, 37c; Class C, galvanized, 26c to 27c.

Clipper, spun	- 21 00
Do., unspun	- 10 50
Plumbers', spun	10 00- 10 50

Lower Prices on Wrought Pipe

WROUGHT PIPE—A lower basis of quotations has been worked out on wrought pipe according to advices now available. The new price list has been worked out along basis made in basic materials in the United States markets, it is said, along with a gradual lessening of production costs due to more efficient labor. Prices on the XX Strong Buttweld and XX Strong Lapweld pipe remain at unchanged figures. Genuine wrought iron standard buttweld only shows a revision in two or three sizes. The new prices appear in panel herewith:

Decline Boiler Tubes Not Here Yet

BOILER TUBES—It was indicated in last issue that lower prices were under contemplation on boiler tubes, but these are not yet effective. Supplies coming to hand have been bought on a high basis, and it may be a little while yet before a lower selling level will be attained. Stocks are now in very good shape, recent shipments improving the situation materially. Quotations range as follows:

BOILER TUBES—	Cold Drawn	Lapweld
1 inch	$36 00	$.....
1¼ inch	40 00	.....
1½ inch	43 00	36 00
1¾ inch	43 00	36 00
2 inch	50 00	36 00
2¼ inch	53 00	38 50
2½ inch	55 00	42 00
3 inch	64 00	50 00
3¼ inch	.....	58 00
3½ inch	77 00	60 00
4 inch	90 00	76 00

Tonnage Sheets Coming Considered Good

SHEETS, PLATES—The tonnage already coming to hand on galvanized and black sheets is considered good and manufacturers and jobbers are quite satisfied that supplies will come along very well from now forward. Prices have ruled at unchanged levels and are quite firm at present basis, which is reproduced below. Orders coming to hand are only fair, but greater activity is looked for in the next few weeks.

BLACK SHEETS—	Per 100 lbs.
10 gauge	$....-$7 50-$8 50
12 gauge	6 85- 7 35- 8 35
12 gauge	6 90- 7 20- 7 90
16 gauge	7 00- 7 25- 8 00
18-20 gauge	....- 7 30- 7 80
22-24 gauge	....- 7 35- 7 85
26 gauge	....- 7 40- 7 90
28 gauge	....- 7 50- 8 00
3-16 inch plate	....- ....- 7 40
¼ inch boiler plate	....- ....- 7 00

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

GALVANIZED SHEETS—		
10¾ oz.	$9 30	$9 75
U.S. 28	9 00	9 25
U.S. 26	8 70	8 95
22 and 24	8 55	8 80
16	8 25	8 50
12 and 14	8 15	8 40

Second row of figures subject to rebate of 25c per 100 lbs. in some quarters for orders amounting to one-half ton or more.

Lead Pipe and Waste Comes Down 1c

LEAD AND ZINC PRODUCTS—In line with conditions outlined in SANITARY ENGINEER last issue, lower prices have been named on lead pipe and lead waste. The decline amounts to 1c per pound, to-day's figures being 13c and 14c per pound respectively. Lead sheets are somewhat easier in some quarters, too, selling down to 11½c-12½c per pound. No change in lead traps and bends has been made.

Solders show a further slight revision to lower levels in some quarters, lower tin and lower lead being contributing factors. The demand is fair and supplies ample to take care of requirements Quotations follow:

Lead pipe, lb.	....	$0 13
Lead waste pipe, lb.	....	0 14
Lead traps and bends	....	Net list
Lead wool, lb.	..	0 14
Lead sheets, 4 to 6 lbs., sq. ft., in rolls, lb.	0 11½	0 12½
Solder, commercial, lb.	0 33	0 39
Cut sheets ½ to ¾c lb. extra and cut sheets to size, 1c lb. extra.		
Solder, guaranteed, lb.	$0 40	$0 45
Solder, strictly, lb.	0 38	0 43
Solder, commercial, lb.	0 33	0 39
Solder, wiping, lb.	0 31½	0 45
Solder, wire, lb.	0 47¼	0 54
Zinc sheets, per lb.	....	0 26

Old Materials May be Revised

OLD MATERIALS—Some changes seem to be under discussion in regard to old materials and an early announcement as to what these may be can be expected. Trade just now is quiet and quotations shown herewith are really only nominal.

Dealers' Buying Prices

Tea lead	$0 05¼	$....
Heavy lead pipe	....	0 08
Yellow brass	0 12	0 13
Red brass	....	0 21
Light brass	....	0 09½
Heavy zinc	0 05½	0 06
Heavy copper	0 22	0 23
Stove plate, per ton	....	25 00

Metals Show Little Change; Tin Down

INGOT METALS — There is very little interest manifest in the various metals and little trading is in progress. It is hard to say what the market is or whether there really is a market just now. It will probably take some little time for what may be called a real market to develop. Tin has declined another 5c in some quarters.

COPPER—No new developments have been reported locally. The metal is quiet and interest lacking. Quotations hold unchanged at around 30c per pound.

TIN—Advices indicate that the London market is up £14 this week, but whether this will have any effect on prices here is doubtful. A slightly lower basis has been reached here, quotations ranging from 70c to 80c per pound.

SPELTER—Perhaps the most active metal is spelter, but even this could be better. Supplies are only fair, but equal to demands. The price holds around 9½c per pound.

LEAD—Lots of it and no place to sell it. That is really the situation on lead and until things open up in the spring little activity is expected. Prices are down around 8¼c to 8½c per pound.

ALUMINUM — There have been no new items of interest develop since last issue, the market being dull and prices holding at nominal figure of 50c per pound.

ANTIMONY—Even at 10c per pound, the local price, there is no activity in this metal and little interest seems to attach to it. Users are few and demand consequently limited.

WHAT THE WORLD WAR HAS DONE TO PRICES

Interesting Figures of Peace Prices Before and After the Big War—Some Lines Record Declines Since Signing of Armistice

WHAT ANOTHER WAR SHOWED IN THE WAY OF PRICE CHANGES

There has been so much written upon the question of the effect of war on prices, and the probable effects of peace, that the evidence of comparative prices, prior to the American Civil War at its conclusion and some years later, should be interesting reading. The prices are derived from "Hunt's Magazine" of January, 1868, and represent New York quotations at the beginning of the years given. The price of gold is also given so that it is possible to measure the depreciation in currency:

	1861.	1865.	1868.
American gold	Par	$ 2.27	$ 1.33½
Ashes, pots 100 lbs.	$ 5.00	11.75	8.25
Wheat flour, state, bbl.	5.35	10.00	10.00
Wheat flour, best Gen.	7.50	15.00	14.50
Cornmeal, Jersey	3.15	8.80	6.15
Wheat, white Ohio	1.45	2.60	3.00
Wheat, red Western	1.38	1.06	2.40
Oats, state	0.37	2.45	0.80
Corn, Western	.72	1.90	1.35
Cotton, mid. up	.12½	1.20	.16
Fish, dry cod, 100 lbs.	3.50	9.00	5.50
Fruits, currants, lb.	.04½	.21	....
Bunch raisins, per box	1.75	5.85	3.80
Hops, per pound	.25	.40	.65
Iron, Scotch pig, ton	21.00	63.00	36.00

	1861.	1865.	1868.
Iron, English bars, tons	$52.00	$190.00	$85.00
Laths, per thousand	1.30	2.40	3.00
Lead, Spanish, per ton	5.25	15.00	6.50
Leather, hem., sole, lb.	.10½	.42	.28
Lime, per barrel	.75	1.15	1.85
Molasses, New Orleans	.37	1.43	.85
Oil, crude whale, gal.	.51	1.48	.70
Pork, old meas., bbl.	16.00	43.00	21.15
Horns, per lb., pickled	.08	.20	.13
Butter, state	.18	.55	.45
Rice, good, 100 lbs.	4.00	13.00	6.50
Salt, Liverpool, gr., etc.	.65	2.27	.50
Sugar, Cuba, good	.06¼	.19	.11⅞
Wool, fleece	.30	.95	.60

It will be noticed that the declines as a rule were gradual, being higher in most instances in 1866 than at the beginning of 1868. In 1866, with gold at $144½, cotton was quoted at 52 cents a pound, English bar iron at $130 a ton, laths at $5 per thousand, Spanish lead at $10 per ton, old mess pork at $28.50 per barrel, sugar at 13 cents a pound and fleece wool at 75 cents a pound. Wheat and corn, however, were cheaper in 1866 than in 1868, white Ohio wheat being quoted at $2.63 at the beginning of 1866.

VISITOR TO CANADA

W. L. Rolf, the founder and manager of the Rolf Heater Co., of Columbus, Ohio, was in Toronto recently making business arrangements to ship their products to Canada. He reports having had a very successful trip. During his stay in a number of Canadian cities before the war his concern did considerable business in Canada, but on account of the restrictions on certain metals they had to discontinue shipping their line out of the United States. Mr. Rolf is very favorably impressed with the Canadian business outlook.

EXHIBITING AT LYONS FAIR

The Goderich Organ Co., Ltd., has made a shipment of closet seats and tanks to the exhibition to be held in the city of Lyons, France, in March next. This fair has become an annual event and is visited by buyers from all parts of the world. The Government has secured 40 booths, which are being allotted to manufacturers who are looking for export trade. The Goderich Organ Co., Ltd., has a quarter section, and hopes for good results from this exhibit.

AN OMISSION

Under the heading "New pipe wrench attachment," an article appeared on page 28 of the January 2nd issue of SANITARY ENGINEER. The name of the manufacturer was inadvertently omitted. Any information regarding the attachment referred to may be procured from Kroeschell Bros. Company, 470 Erie Street, Chicago.

ADVANCE PRICES FOR WORK IN PRINCE RUPERT

The following communication reached us recently to the effect that sanitary and heating engineers in Prince Rupert have had to make a change in prices charged for work done.

"Owing to increased cost of labor and overhead expenses it has been necessary for us to increase our charges to one dollar and twenty-five cents per hour from 8 a.m. to 5 p.m. with time and one-half for overtime until 12 p.m.

(Signed)

SMITH & MALLETT,
STEEN & LONGWILL,
HARRY HANSON,
HENRY LETOURNEAU."

ELECTED TRUSTEE OF BOARD OF EDUCATION, TORONTO

Many of the readers of SANITARY ENGINEER will be interested and pleased to know that Joseph (Joe) Bell, the worthy representative of Warden King, Ltd., was elected one of the trustees of the Board of Education, Toronto.

Everybody in the trade knows Joe, and thousands of Torontonians have called upon him from time to time when having trouble with their heating systems.

Mr. Bell has had a practical education, having been in the business for upwards

"JOE" BELL
Representative of Warden King Ltd. Recently elected Trustee to Toronto Board of Education.

of 23 years, which no doubt will serve him in good stead as a servant of the public of Toronto. And if he takes up the new duties with as much zeal as he puts into his everyday life, the Board of Education will find in him an invaluable addition to their membership. No better and fairer member of the heating trade can be found, and we wish him every success.

The time was never more opportune than now for men with real brains to aspire to municipal honors in Toronto. There is not one department that is not wasting hundreds of thousands of dollars every year, all because of the clique in power at the Toronto City Hall, a state of affairs which is really perpetual.

WASTAGE OF FUEL

"Sufficient is being wasted by the users of fuel oil in one year to run all the railways of the United States for one month." Such is the conclusion drawn by experts of the Bureau of Mines, who have co-operated with the Fuel Administration in a general survey of the use of fuel oil for power purposes in the United States. Further, the experts say that the forty million barrels of oil so lost each year are equivalent to 10 million tons of coal. As one result of the investigation, a handbook for boiler plant and locomotive engineers on the efficient use of oil fuel has been issued by the Bureau of Mines, giving instructions to all those who have oil-burning plants. A free copy of these instructions has been forwarded to all known plants using fuel oil.—"American Gas Engineering Journal."

NEW OIL BURNER

The more extensive use of oil fuel offers a partial solution to the coal shortage (in the U.S.A.). A description is given of the Ray Oil Burner, which, it is claimed, can be used in anything from a residence hot-air furnace to a 500 h.p. steam boiler.

Steam and air atomization is said to be wasteful of oil. Air atomization requires complex equipment, and steam atomization is only feasible, it is stated, for high-pressure work. The Ray burner utilizes mechanical atomization. The oil is atomized in a horizontal open cup driven at 3,450 r.p.m., air being forced at high velocity around the cup and in a direction away from it. Guide vanes impart rectilinear motion to the air and oil mixture. An electric motor with hollow shaft is utilized to drive the burner, and the totally enclosed motor-frame is cast hollow so that oil may be passed continuously through the casing. This secures the double advantage of cooling the motor and warming the oil. With the exception of domestic stoves, fuel oil as low as 14 degrees gravity can be burned without smoke, soot, or dirt.—"Electrical Review."

GAS WELDING FOR BOILER TUBES

"Bagged" and leaky boiler tubes may be repaired by oxy-acetylene welding. As many as fourteen welds have been made in one tube before discarding the latter. The "bag" on the tube is heated slowly by the torch until it is a bright

cherry red and then driven back, beginning at the edges and working towards the centre. The leak, if any, is first welded up. Sections of sound tube are welded on to damaged tubes. Including labor, material, and cost of setting up, the total cost is about 75 cents per weld. The oxy-acetylene torch may be used to anneal crystallized tubes. — "Electric Railway Journal."

HOW MANY OF THESE RULES DO YOU APPLY IN YOUR BUSINESS?

The National Association of Credit Men, which now has a membership of more than 20,000, recommends the following rules for merchants for figuring costs and profits:

1. Charge interest on the net amount of your total investment at the beginning of your business year, exclusive of real estate.
2. Charge rental on real estate or buildings owned by you and used in your business at a rate equal to that which you would receive if renting or leasing it to others.
3. Charge in addition to what you pay for hired help an amount equal to what your services would be worth to others; also treat in like manner the services of any member of your family employed in the business not on the regular payroll.
4. Charge depreciation on all goods carried over on which you may have to make a lower price because of change in style, damage, or any other cause.
5. Charge depreciation on buildings, tools, fixtures, or anything else suffering from age or wear and tear.
6. Charge amounts donated or subscriptions paid.
7. Charge all fixed expenses, such as taxes, insurance, water, light, fuel, etc.
8. Charge all incidental expenses, such as drayage, postage, office supplies, livery expenses of horses and wagons, telegrams and telephones, advertising, canvassing, etc.
9. Charge losses of every character, including goods stolen or sent out and not charged, allowance made customers, all debts, etc.
10. Charge collection expense.
11. Charge any other expense not enumerated above.
12. When you have ascertained what the sum of all the foregoing items amount to, prove it by your books, and you will have your total expense for the year; divide this figure by the total of your sales, and it will show you the per cent. which it has cost you to do business.
13. Take this per cent., and deduct it from the price of any article you have sold, then subtract from the remainder what it cost you (invoice price and freight), and the result will show your net profit or loss on the article.
14. Go over the selling prices of the various articles you handle and see where you stand as to profits, then get busy in putting your selling figures on a profitable basis and talk it over with your competitor as well.

DRINKING FOUNTAINS IN WINNIPEG

The accompanying illustration gives the reader an idea of the type of sanitary drinking fountains which are located in the streets of Winnipeg. Winnipeg is blest with men at the head of its various health departments who are

Two Styles of Drinking Fountains Used in Winnipeg.

gifted with advanced views, aggressive in many ways and never slow to voice their opinions publicly. In that way they invariably receive a sympathetic hearing. Winnipeg has several of the finest public comfort stations on this continent in use, and we hope to report that more will be erected when conditions become normal.

PLUMBER AND AUTHOR

We do not often come across a member of the trade who turns his hand to writing a book. But even so, one must make a success in his or her first undertaking before they can ever hope to succeed in a second.

Coming to Canada from Scotland in the year 1905 W. C. Millar went to work in

PTE. W. C. MILLAR
Plumber-author of "From Thunder Bay Through Ypres With the Fighting 52nd."

Winnipeg at his trade, a few years later striking out to the twin cities as foreman of the Fort William Plumbing and Hardware Co., and a year later establishing a partnership business known as Millar & Silk.

Mr. Millar was so well liked by the trade that he was elected delegate to represent the Fort William Society of Sanitary Engineers at the convention held in Calgary in 1912. One year or so later Mr. Millar took over the business and conducted same until the year 1915, when he joined the 52nd Battalion of Fort William. So much for the plumbing side of his experience. We will now turn to his career as an author. Pte. W. C. Millar returned home and having no doubt taken notes of his experiences at the front, he decided to write about the things he saw and a few of the hair-breadth escapes he, as well as a number of his comrades in arms, had on the battlefield.

The Book

The book is entitled "From Thunder Bay Through Ypres with the Fighting 52nd." It is a book of twenty-one chapters. It is well written and is more after the style of a diary.

The reader is carried along in a very vivid fashion all the way from Fort William to the various battlefronts. There are of course a number of comrades introduced to the reader, and as one reads one feels that he is really one of the members of the "Fighting 52nd." The screech of the shell can be heard and the "claggy" (sticky) mud can almost be felt as one reads on.

Private W. C. Millar has published this book of his experiences and is trying to interest every member of the trade in it by selling them a copy, and with this aim in view SANITARY ENGINEER is introducing the book to its readers.

Those desiring to procure a book containing certain phases of the war, written by one of their own members, should write to the author at his address, 339 North Norah Street, Fort William. The price is $1.00, postage prepaid.

NEW PATENTS

Continued from page 41

accommodated within said plunger casing, said plunger being adapated, when raised, to move said ball to close said outlet orifice, and said ball being capable of retention in such closing position at a lower pressure than that required to raise said plunger, and a slidable member, operable beneath said plunger, having a restricted passage therein through which fluid is admitted to said pulnger.

3. In a device of the class described, a ball casing, a plunger casing communicating therewith, said ball and plunger casings having outlet and inlet orifices therein respectively, a ball within said ball casing, a tubular seat between said casings for said ball, said seat having passages therein whereby fluid may pass through the device when said ball is at rest, and a plunger having a stem slid

able in said tubular seat to move said ball to close said outlet orifice, said ball being capable of retention in such closing position, at a lower pressure than that required to raise said plunger.

4. In a device of the class described, a ball casing, a plunger casing communicating therewith, said ball and plunger casings having outlet and inlet orifices therein respectively, a ball within said ball casing, a tubular seat between said casings for said ball, said seat having passages therein whereby fluid may pass through said device when said ball is at rest, a plunger having a stem slidable in said tubular seat to move said ball to close said outlet orifice, said ball being capable of retention, in such closing position, at a lower pressure than that required to raise said plunger, and a slidable member, operable beneath said plunger, having a restricted passage therein through which fluid is admitted to said plunger.

COAL CHEAPER THAN ELECTRICITY FOR HEATING

If the Whole of Niagara Falls Were to be Converted Into Electricity, There Would Not be Sufficient to Heat All the Homes in Toronto—Electricity is a Power Energy

A BULLETIN just issued by the Advisory Council for Scientific and Industrial Research on possibilities of electric heating for domestic purposes in Canada disabuses the public mind of a somewhat widespread idea that electricity will eventually take the place of coal and thus solve the fuel problem. The bulletin, prepared by Mr. Barnes, of the Hydro-Electric Power Commission of Ontario, covers in clear and concise manner the main facts as to comparative costs of domestic heating by coal and by electricity, and reaches the conclusion that, while electric heaters will prove valuable as coal savers in mild weather and for other auxiliary purposes, "it is hard to conceive of a time when electric energy will compete successfully and on a large scale with coal, oil, gas, etc., for heating.

The future of hydro-electric development, acording to the bulletin, lies mainly in its use for mechanical power purposes. Coal must continue to be the people's main reliance for heating purposes in climates such as that of Canada.

After noting the popular idea that the immense water-power of Canada will eventually be used to solve the growingly acute fuel problem and that some ingineers "who ought to know better" have been giving out hints that sooner or later electricity would come to the rescue, Mr. Barnes proceeds to point out the scientific and economic difficulties in the way. He gives facts and figures as to typical cases where electric heating might be substituted for coal. In the City of Toronto, for instance, where there are about 80,000 homes, the heating requirements for houses alone would be equivalent to about 960,000 horse-power, while the entire Niagara output is now only 780,000 horse-power. About 6,000,000 horse-power represents the whole possible development of Ontario water-powers, which is quite inadequate to supply even the existing homes of Ontario with electric energy for heating alone, exclusive of all other domestic, commercial and industrial requirements.

Furthermore, he points out that the market for electric heating is only in the winter time, and for the summer months there would be nothing to provide a market for the output of the enormous and costly plants which would have to be built.

On present Toronto rates for electric heating Mr. Barnes finds that for an eight-roomed house the cost would figure out to about $375 for the season's heating, as compared with nine tons of coal, costing, say, $90. Even if supplied of the lowest existing power rates, viz., at Niagara Falls, the cost of electric heating would be more than one and one-half times that of heating with anthracite.

As to future possibilities in the way of more economic methods of fuel using, Mr. Barnes points out that there is no room for improvement through the cutting out of waste in electric heating, since all the energy is now utilized, but in the matter of coal, engineers still have from 15 to 60 per cent. "waste" as a margin for improvement and consequent reduction of costs.

In any event, the cost of coal would have to rise to not less than $15.50 per ton before the cost of heating by means of it would be equalled by that of heating by electricity even at the low rate of 0.35 per kilowatt hour.

The bulletin notes, however, that "the use of electric heaters as auxiliaries to other systems to warm up an otherwise cold room, or during chilly periods in the spring and autumn when the furnace is hardly needed, will prove in very many cases a great convenience; and, provided that the periods of use be short, e.g., for an hour or two in the morning or evening, it will be almost as economical to use electric energy in this manner as to light a fire in the furnace, and very much less trouble.

"Again, at present rates for electric current, it is likely that considérable reductions may be made in the cost of electric heating by the judicious use of electric fans to thoroughly circulate the air from the heater and bring all parts of the room to approximately the same temperature; the extra cost of current required for a fan is very small compared with the advantage to be gained."

WILL THIS JOB WORK?

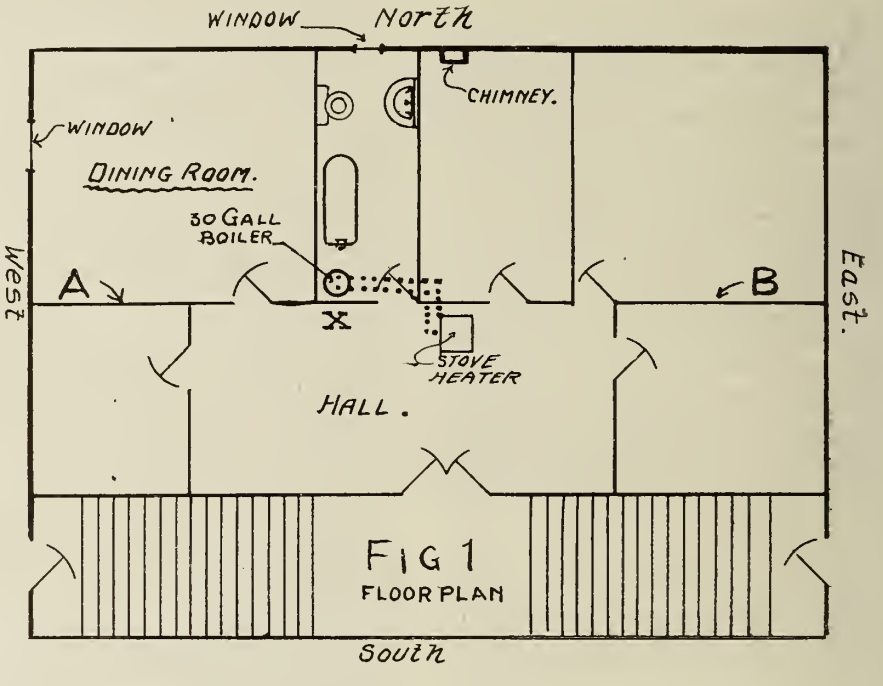
Editor Sanitary Engineer,—I am sending you herewith a rough sketch of an overhead residence, and would like to know if it is possible to heat the range boiler as located in the bathroom by connecting a pipe running from the heater over the top of the door to the top of the boiler and another pipe from the bottom of the boiler under the floor to the stove, or, would this cause the water to pound or make a noise in circulating from the stove to the boiler? I would like to be able to have the stove located where shown in sketch so as to assist in heating the front rooms more comfortably. The boiler is located about four feet from the stove and the pipes will have to be raised about 4¾ feet, then drop a few inches to the top of the boiler. The boiler is fed from a cistern situated close to the ceiling in the bathroom (not shown on sketch). If the stove cannot be so connected as shown by dotted lines going over and under the door, can the boiler be located in place indicated by a cross?—R. J. T.

In Fig. 1 our readers will note the sketch submitted by R. J. T. The dotted lines shown give one a rough idea of the way the pipes are required to be installed, though if there is no serious objection we would suggest that the pipes all be run on the outside of the wall, then only one wall will have to have pipes passing through instead of as shown in Fig. 1, which shows the pipes passing through two walls. Of course by having the pipes from the heater pass through the wall behind the heater, no pipes will be seen in the hall.

Fig. 2 shows an elevation wall plan, the dotted lines describing both the pipes and boiler more clearly at a point indicated at A and B in Fig. 1. The cistern on the ceiling is also shown.

Fig. 3 is an enlarged view of the location of boiler, cistern, stove and piping. It will be noted that the pitch of the pipe is all in one direction from the top pipe at the heater to the boiler, and then the return pipe under floor slopes up to the heater.

Great care must be taken that no pipes are trapped. By looking carefully over



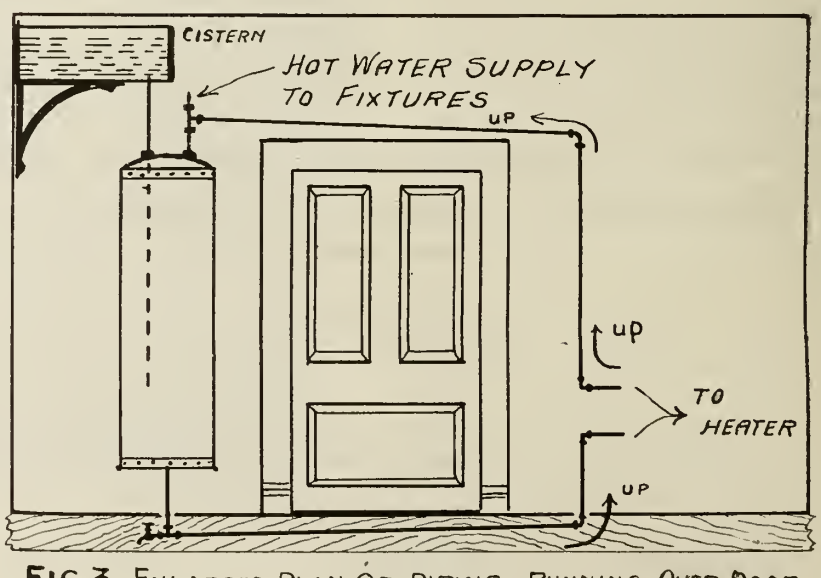


FIG 3 ENLARGED PLAN OF PIPING, RUNNING OVER DOOR AND UNDER FLOOR.

FIG 2 SHOWING WALL PLAN AT A. AND B. IN FIG 1

the piping plan and following out the principle that no matter how many crooks or bends are required to get the heater connected, all the pipes must slope in the direction shown. The pipe to the fixtures being taken off at the highest point will eliminate any cause that would result in water hammering. Of course it may be that if there is too much coil placed in the heater and not enough hot water drawn off the boiler, there is a likelihood of the water boiling and when cold water flows from the cistern, a number of slight explosions, or noises, will be experienced. This can only be overcome by taking care not to have too much coil in the heater.—Editor.

HOW SHOULD THESE FIXTURES BE VENTED?.

Editor Sanitary Engineer,—I have just been awarded a contract to instal two sets of water closets and wash basins, three water closets and three wash basins in each set, with one extra water closet and one wash basin at side in a smaller compartment. Would you kindly let me know which you think would be the best way to vent the above fixtures. Enclosed please find a small sketch which will give you an idea of what I require.—W. J. N. V., B.C.

Fig. 1 is a reproduction of the sketch submitted by our inquirer. It will be seen that the six wash basins are to be installed back to back and that the seven water closets are practically in a battery. Our inquirer however has not informed us whether or not there exists a plumbing by-law in his district, but, if there is, then of course the by-law in force must by all means be followed.

He informs us that he has been awarded the contract and this being the case he no doubt desires to instal the work in as practical and inexpensive a manner as possible. We are therefore advising the most modern method that can be adopted, known as the simplified system of plumbing and venting.

Fig. 2 shows a general plan of the soil and waste pipes, describing the position of the various fittings to receive the circuit vent pipes for both the water closets and basins.

Fig. 3 shows an elevation plan of the seven water closets in battery, with the piping of the drain as well as the loop or circuit vent. This elevation also shows

SANITARY ENGINEER RECEIVED TESTIMONIAL FROM PROFESSOR OF PHYSICS

DEPARTMENT OF PHYSICS, O.A.C.
GUELPH, January 6th, 1919.

Editor, "Sanitary Engineer,"
Toronto, Ont.

Dear Mr. Newsome:

I have been a subscriber to "SANITARY ENGINEER" for about five years, and I wish to say that I have always looked forward with great pleasure to the arrival of every issue, and I have never been disappointed. The reason for my interest in it is that it contains good articles on such subjects as sewage disposal and water systems for rural homes, water supply and means to keeping it pure, science and practice of pumps and pumping, humidity in relating to private homes, windmills, science and practice of plumbing, heating systems for private homes, and ways and means of conserving fuel, and advanced ideas regarding systems of plumbing and sanitation. The Query and Answer Department of the publication always contains valuable information in a specific manner on practical problems pertaining to water supply, ventilation, heating, pumps and pumping, sewage disposal, right and wrong ways of plumbing, etc., etc., all of which are most interesting and often valuable to the practical physicist like myself who teaches the science of these subjects more or less, and almost every day receives queries from farmers and others regarding such problems

I have always, too, been impressed with the thought that this publication strongly encourages, by its editorials, articles and correspondence courses, better education and greater efficiency for those men actually engaged in putting in our water-systems, plumbing fixtures, sewage disposal plants, heating systems, etc. Since all these parts of the equipment of a modern home are so essential for comfort and happiness and are also costly, does it not seem reasonable that they should be installed by experts who know all about them from A to Z? No intelligent plumber, it seems to me, can read this publication sincerely without carrying more intelligence, more interest and more efficiency into his actual labors day by day. These are the things that cause him to realize that he is more than a mere laborer with his hands for the public, rather he is giving real and permanent service to the State, he is a benefactor of a high order.

Personally I believe that every man who owns a home would be greatly benefited by having a good knowledge of the science and management of his furnace, the plumbing fixtures, methods of heat, and moisture control, etc. I know of no more valuable source of information on such problems and kindred ones than "THE SANITARY ENGINEER," published semi-monthly by The MacLean Publishing Co., Ltd., Toronto.

I am enclosing a letter from a correspondent, which I wish you would answer for me, and you may put it in your query column. Please return letter and send answer direct to me.

I am,
Yours sincerely,
(Signed) R. R. GRAHAM,
Lecturer in Physics and
Sanitary Science

MUELLER

Compression Sink Bibbs

SIMPLE elegance, combined with superior strength and wearing quality, is what you give your customer when you install MUELLER goods.

The many advantageous features of MUELLER compression bibbs give maximum service from the bibb as a whole. The anti-spreading device that breaks up the whirling motion of the water and the corrugated stem and handle, allowing the handle to be set at any angle without becoming loose or wobbly, are only two of these features.

MUELLER Bibbs are the best the market affords. Write for prices.

FLOOR PLAN OF SOIL AND WASTE PIPES SHOWING CONNECTIONS UNDER FIXTURES

QUESTION BOX

(Continued from page 51)

where the circuit vent from the wash basins enters the main loop vent. It also describes the proper location for cleanout plugs, one at the foot of the soil pipe, and one at the extreme end of the soil pipe to the left of the first water closet. If our readers will note they will see a number of dotted lines at this end showing how, if desired, the cleanout plug may be extended to the floor on which the water-closets are installed. This would make it very handy to clean out if ever the vertical stack became clogged up.

The fittings to be used under the water closets would comprise a regular 4 x 4 C I Y, a long cast iron bend, a brass ferrule and a piece of 4-inch lead waste pipe to the floor into which the water closet bowl would be fitted. Or, if the depth between the top of the floor and the horizontal soil pipe is not too great, it may be possible to use long lead bends and the brass ferrule and C I Y.

This and all such horizontal soil pipes must be well supported by the use of good stiff hangers.

We will now turn to the elevation plan, Fig. 4. This describes how a battery of wash basins may be installed by circuit venting in the same way as the water closets are vented. If our inquirer desires he may install a horizontal waste pipe under the floor and run a separate vertical waste and vent for each basin, connecting all the vents into a 2-inch horizontal vent in something like the manner shown in Fig. 3. This of course is simply a side view of the piping shown in Fig. 4.

Then again, the circuit vent may be run up to the same height as main vent over the water closets if necessary, or as an alternate method, the plan shown by the dotted lines may be followed out.

If one horizontal waste pipe is installed as shown in Fig. 4 it will be necessary to fit a cleanout into the extreme end as shown, and it would not be a bad idea to put in a 2-inch fitting and cleanout plug at A, so that this waste pipe could be cleared out easily. There are far too few cleanout fittings used in plumbing construction, but this, the writer believes, is due to the fact that there are very few on the market that can be depended upon.—Editor.

The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH

Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with wood handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

Folly to Hold Off for Lower Prices

Duty of Business is to Go Ahead, Says J. E. Otis; No Big Decline in Sight

A TENDENCY on the part of business men to hold back new enterprises, in expectation of lower commodity prices and wages, is a mistake, in the opinion of Joseph E. Otis, vice-president and acting head of the Central Trust Company of Illinois.

"I have no sympathy with the man who is sitting back, awaiting lower prices," said Mr. Otis to-day. "The people who are awaiting a drastic decline in prices aren't going to get it, they are going to get left. In other words, I do not believe we are going to see any immediate and drastic decline in commodity prices. There is a world-wide scarcity of many materials and production costs are going to continue abnormally high.

"We have had perhaps a certain amount of inflation. To the extent that present high prices are due to that cause, moreover, we can expect no immediate decline. The process of deflation will be gradual.

"If we are all to hold back, awaiting lower prices, we should produce conditions of a sort that would benefit no one. It is the duty of business to go ahead and seize the opportunities now awaiting. If a manufacturer were to defer building needed additions to his plant, in the hope of securing a lower construction cost at some indefinite time in the future, he probably would lose more profits on goods which he might have been producing and selling in the meantime than he will save on cheaper construction costs."

Frank W. Thomas, of A. O. Slaughter & Co., said to-day:

"In considering the outlook for commodity prices, we must bear in mind that wages are going to continue high for an indefinite time, and that European competition, formerly so keenly felt in our markets, is not going to be so severe as it was before the war. Wages have been advanced abroad with no immediate prospect of their return to the pre-war basis."

Frank A. Vanderlip, president of the National City Bank of New York, in an address delivered in that city last night, declared that it is possible to transfer 15,000,000 men now engaged in war activities to works of peace without greatly disturbing conditions.

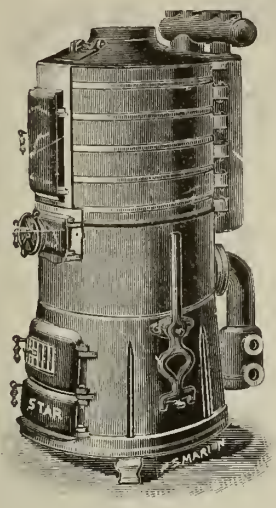
"I would not argue that we can make this transition without any jolt," he said. "There will be some. But I believe that the demand for labor is so great that it is possible to make the transition without disaster.

"We may make a cushion of public works. That is possible. But there are really tremendous orders that may now be executed, and on the whole I would not be surprised to find that we shall see no surpluses of labor, providing labor and the employer of labor each does his best to help in this readjustment."

John N. Willys, president of Willys-Overland Company, says:

"Material prices and wages are not likely to come down in a hurry. With the passing of the first flurry of unsettlement of prices which followed the signing of the armistice there is now a noticeable steadying of the market."

Thousands of Star Boilers in Use requiring repair Parts



It will be a long time before folks forget the coal troubles of the last few seasons.

The principal feature of the Star Boiler is that no other round hot water boiler has any coal-saving improvement not embodied in the "Star."

Then, too, while boiler installation and repair time is here, why not stock up with Star parts, for which O. Belanger has taken over the rights and is now making?

Many thousands of Star Boilers are in use requiring these repair parts hitherto unobtainable.

Write to us at once in time to catch the season's business.

We guarantee prompt deliveries.

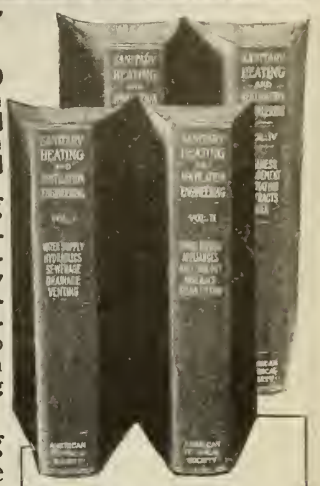
GET IN THE BIG MONEY CLASS NOW

SANITARY HEATING AND VENTILATING ENGINEERING



SANITARY Heating and Ventilating Engineering offers wonderful opportunities for advancement and money making right now. Modern methods and appliances are fast replacing the old ones, and the men who are up-to-date — the trained men — the men who know — are going to reap the benefit.

Get your share of the big money now. Here is the first thing for you to do — tear the coupon off this page and mail it to us today. It won't obligate you in any way and you don't have to send a penny, but it will bring you these four big volumes — just off the press — packed full of the very things you need to train yourself — all worked out for you in clear, understandable English by eighteen of the most successful men in these professions today.

No matter what your job is or how much you earn, you need these books — and you need them now. If you are in business for yourself, they will make your business bigger and better — the volume on business management, estimating and contracts and specifications alone will do it.

4 big volumes, size 5½ x 8¼ ins., bound in flexible American Morocco and trimmed in gold: 1454 pages: over 1100 pictures, diagrams and plates.

Here's what the Books Contain Thousands of problems under the following headlines are all worked out and made as simple as A-B-C.

Sanitary Science and Materials.
Water Supply. Hydraulics.
Sewers and Drains.
Drainage and Venting.
Sanitary Appliances.
Sewage Disposal.
Bacteriology and Sanitation.
Infectious Diseases.
Steam and Hot Water Fitting.
Domestic Hot Water Supply.
Heating and Ventilating Engineering.
Sheet Metal Work.
Business Management.
Estimating.
Contracts. Specifications.
Mechanical Drawing.
General Index and Review Questions and Index to Each Volume.

Free Consulting Service With these books goes free a year's consulting service in the American Technical Society, worth $12.00. This enables you to consult our engineers and experts for one year without charge. Ask as many questions within the scope of the book as you want for one year.

SHIPPED FREE

Examine the books and see for yourself just how valuable they are, but don't send us any money. The little coupon is all you need. Fill out all three lines and mail it NOW. It will bring you the whole set of books by express collect, and you can keep them seven days to use as you please—study them at home—take them to your shop—try to find some problem they won't answer, and ship them back at our expense if you think you can get along without them. If you want to keep the books after seven days' use, send us only $2.00. The balance can be sent in monthly payments of $2.00 each until the special introductory price of $13.80 is paid.

It will take years of hit-or-miss experience to gain what these books will give you in a short time; so don't pass up this opportunity—ACT NOW. We may never be able to offer this low price and these special terms again—only 7c a day. Tear off coupon before you lay this down and mail *today*.

This is a "Q" Foot Valve

And it Just CAN'T Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

CAUTION!

This is a personal message to you. Kindly read every word—you owe it to yourself to do so.

THE thing every steamfitter prizes most highly is his reputation. Without it his standing with his customers—his business—everything is *valueless.*

When a customer calls you in to repair a leaky or cracked boiler you feel it your duty to give him a good job. That's the *only* way to make money. If your judgment tells you it's the kind of job on which to use "X" Liquid—your reputation is at stake if "X" doesn't make good. That is why we take so much care in making "X"—and seeing that it gets to you sealed—branded—and in good condition.

Now, if you should use an imitation of the genuine "X" Liquid you are not going to get "X" results. Patents on "X" Liquid are allowed—and others are pending. The quality of "X" *can't* be imitated. When this inferior imitation fails to do the work properly who gets the blame? Who stands the comebacks? Who loses time and money? YOU—*of course.*

So we owe it to our friends to warn them that there is no other product on the market that can do what "X" does. "X" is the ONLY *Scientific* Process of repairing leaky and cracked boilers—and for making them LEAKPROOF—RUST-PROOF—and SCALEPROOF.

"X" Liquid is making money for over 24,000 steamfitters. These men will hardly risk their reputations on any unknown, untested product. They'll stick to the genuine "X"—*every time.*

Ninety-nine out of every hundred manufacturers of boilers and radiators use, sell and recommend "X" Liquid. Every good jobber sells it. And the Government uses "X" regularly.

Every can of "X" Liquid carries a guarantee to make 100% good—*or your money back.*

Deliveries are very bad this winter—due to freight conditions. *Keep plenty of "X" on hand for emergencies.*

"X" LABORATORIES

636 Washington Street, Boston, Mass. U.S.A.

Johns-Manville Radiator Trap

THE EXACT cost of material and labor plus a definite profit for you—that is your bid on a trap installation job when you use Johns-Manville Traps. There is no guesswork to it.

We give you the price you are rightly entitled to and the simplicity of the trap insures you a profit on the installation.

This Johns-Manville Trap is installed in record time—and once installed, you are through—no call-backs for adjustments or repairs. This trap doesn't jam, stick or air-bind—it works. Ask any Johns-Manville salesman to show you one.

Business Books for Readers of Sanitary Engineer

HOW TO FIND FACTORY COSTS $2.40

WHAT does a good cost system mean to you? If you are a factory executive, you will unhesitatingly answer "Dollars!" For such a system will tell you how much money you are making, what it is costing you to operate, where you are spending money excessively, where wisely. In fact, in hundreds of ways, a good cost system pays dividends, locates leaks, cuts down expenses, stimulates increased production and better work, saves money. How to Find Factory Costs gives a thorough discussion of costs. It was written by C. Bertrand Thompson, who for years has made a close study of costs, systems and methods. There are few men in the country who are so well qualified to write on this subject as Mr. Thompson. The chapter titles of the work will give you an idea of its value:

1—What a good cost system means to you.
2—What are cost accounts?
3—What goes to make up your cost accounts?
4—How to handle indirect costs.
5—What about interest and depreciation.
6—Charging each unit with the proper share.
7—The machine hour rate plan.
8—How to handle the cost of selling.
9—Tying the costs into the general accounts.
10—An effective system of classification.
11—Taking factory costs apart.
12—A cost system that safeguards.
13—Making costs and bids agree.

Get a copy of this book and see how it will help you to locate profit-draining leaks and increase earnings. 191 pages. Illustrated.

INDUSTRIAL ORGANIZATION $1.85

"IF highly organized businesses are characterized by one thing more than another, it is the evidence of the exercise of plan and forethought in every detail of operation. The manager who does nothing without a carefully worked out plan and strives incessantly to conform his business to his plans, has already a scientific viewpoint on management"—so says Harry Franklin Porter, in the first chapter of Industrial Organization. Every manufacturer, plant superintendent, and factory executive should read this book, not simply because it deals with industrial management and organization, but primarily because it is written by such men as Harry Franklin Porter, Clinton E. Woods, C. B. Auel, Nicholas T. Ficher, D. C. Eggleston, W. Poole Dwyer, F. M. Feiker, etc., men who have made an intensive study of factory problems, stock room records, management methods, etc. Inspection of the volume will quickly indicate its value in working out a plan of factory control, building and equipping the plant, paying labor, and getting out the product. 200 pages. Illustrated.

HANDLING MEN $1.85

SEVEN hundred and sixty-three of the employees of one manufacturing plant in America have been with the concern for a period of from 10 to 20 years! That's a record hard to beat. To some executives it may appear an impossibility for it represents loyalty of the highest order. But after all, is it so hard to keep employees loyal and enthusiastic? See what Frank Disston says about it in Chapter VII of Handling Men. Then glance over the other 18 chapters of this remarkable book and learn how many of the shrewdest executives in the United States are solving the employee problem, keeping alive the enthusiasm of their workers, training them and winning their confidence and good-will. Handling Men lays before you the experience of such men as Henry Disston & Sons, Incorporated, Recording and Computing Machines Company, Florence Manufacturing Company, Strouse-Baer Company, United States Steel Corporation. It tells how to hire and select, how to hold your men, how to break in and develop men, how and when to install a profit-sharing system. 200 pages. Illustrated.

Temper testing leaks How prevented

BOILERS, like children, have certain tendencies for good and bad.

With boilers one of the most trying is sand-hole leaks. They show up when you least expect them. Generally on carefully chosen zero nights.

Just before going to bed you take a last look at the fire, and find the boiler giving an imitation of an open faucet.

Punctuated 'phone appeals to the boiler man fail to stir his lethargy. Tells you he'll "be around in the morning." Follows an oil stove siege, waiting for new parts.

We figure that finding leaks is up to us. That's why every Burnham Boiler Section is given an hydraulic pressure test three times higher than it will have to stand in actual use.

We believe it is better business to pay for prevention than to "sell repairs."

Which ends Chat Number Nine, of which there are eight more to follow.

Advertising That Brings You Business

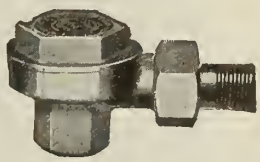
Building has been on the decline for some time, but the tide is turning. You want to be ready for the new business; so do we. That is why we are advertising the excellence of Dunham Heating Service to office and factory owners and home builders everywhere.

This phase of our business cannot fail to interest you, as the advertising which we do makes it easier for you to recommend and install products that have given entire satisfaction for the past fifteen years, and which will continue to do so.

The theme of our argument is the greater satisfaction to be had from a steam heating system equipped with the Dunham Radiator Trap. This little device automatically relieves the radiator of the entrained air and water, thus permitting the steam to give up its heat in the most efficient manner.

The DUNHAM HEATING SERVICE

You will be interested in the full details of the Dunham story. Fifteen years' experience is behind it.



The Dunham Radiator Trap

It comprises a body, a cover and a thermostatic disc which is secured in the cover. There are no loose parts—no sliding contacts—nothing to gum up—nothing to obstruct the valve opening. It is made entirely of bronze and brass. Made with special roughing-in measurements for replacing imitating devices.

WE SPECIALIZE IN

PIPE THREADING TOOLS

Take Another Look At This Job

ESTABLISH PEACE

If you desire to establish lasting peace in your shop, you will have to furnish your men with good tools. Men will not do the same amount of work if that work is hard. The more you *INVEST* in tools if they're good tools, the less you will SPEND in labor. To invest is to establish an asset, to spend is to create a liability. Our tools will save you money and make peace in your shop.

ESTABLISH PROFIT

Work made easy becomes a pleasure. Jardine and Toledo Pipe Threading Tools make threading pipe so easy that a boy can thread a 4-inch pipe as easy as he can thread a ½-inch pipe.

Not only so but when a thread is made with one of our tools it's a good thread. No cutting off pieces of pipe. No lost time and no leaks. That's the way to establish a profit on every job.

"MADE IN CANADA"

You'd Never Attempt to Run an Automobile Without a Carbureter

THEN WHY INSTAL A STEAM HEATING SYSTEM THAT IS NOT UNDER CONTROL?

The day is past when a heating system is only made up of pipes, fittings, radiators and boiler. No heating engineer can claim the utmost of efficiency out of every pound of coal consumed in a heating system that is not fitted up with temperature and heat controlling devices any more than he could say he had control of a horse without bits in the mouth and reins.

Not only so, but there's no science in a heating plant not equipped with temperature control and regulation, and thousands of tons of coal are being wasted by poorly installed plants every year.

You can make more profits and save coal by consulting us about your next steam job. Write us for literature and watch our advertisements.

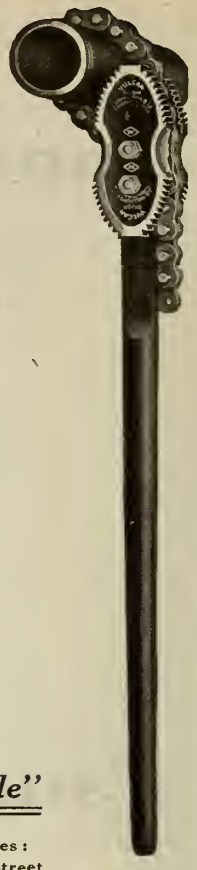
Mark of Proof
Is Proof of Quality



There's proved and certified strength in every

WILLIAMS' IMPROVED "VULCAN" CHAIN PIPE WRENCH

Each and every Flat Link Chain is "proof-tested" to two-thirds of its listed catalog strength in a standard testing machine. To each chain so tested is attached the Gray Leaden Seal, illustrated above, and every Flat Link Chain leaving our works *must* bear this seal—the Proof of Quality—as evidence that it has passed our standardized "proof-tests."

Look for this Mark of Proof for its Proof of Quality—it guarantees uninterrupted, severe service as well as safety to the operator. Williams' Wrenches—"Vulcan" and "Agrippa"—are the *only* chain wrenches which offer this certified assurance.

First Cost *versus* Upkeep Cost!

The purchase price means nothing if the upkeep cost is not low.

The purchase price of King Boilers is no more than the average boiler and yet—

The consumption of fuel—*the upkeep cost* is lower—considerably lower.

The thin, peculiarly shaped waterways in the "King" mean quickly heated water and perfect circulation, which causes a saving in fuel because it obviates the necessity of "extra firing" to move cold water from the radiators.

The Trade should use this quick-heating, fuel-saving argument now while fuel is scarce and high in price.

Why Jenkins Bros'. Valves are Superior

Fig 106

They are the original renewable Disc Valves. They have more imitators than all other makes of valves combined. They have kept pace with increasing steam pressures and severe working conditions. They are of the simplest design, and can be easily repaired by any man of ordinary intelligence. They are made interchangeable in every part, and any part can be duplicated promptly and inexpensively by the dealer. In the majority of cases they can be repaired by merely changing the disc without the laborious task of regrinding.

Fig. 108

They are recognized as the Standard Steam Valves in all parts of the World, and wherever there are supply houses—Jenkins Bros'. Valves will be found. The Standard of quality never changes except to improve, and while to-day there are hundreds of imitators, the sales of genuine Jenkins Bros'. Valves are constantly increasing.

A Veritable Encyclopedia of Motor Truck Facts, Figures, Methods and Systems

Here is a book that considers practically every phase of successful motor truck operation. It was written by S. V. Norton of the B. F. Goodrich Company, after a country-wide investigation into the possibilities of the motor truck.

It describes the many ways in which the motor truck is being used to win business, give better service and build profits. It gives a description of practical, low-cost delivery systems—tells how to lengthen the life of the motor truck—what to look out for—how to map out a complete routing system—how to figure upkeep costs—how to keep your truck going at minimum expense—in short, here is a book that will tell you anything you want to know about successful motor truck operation, that will enable you to get 100 per cent. service from its use.

Almost every method described in The Motor Truck as an Aid to Business Profits is accompanied by an illustration, a chart or a diagram. You read the description, then with a glance at the illustration you see instantly how it works and how you can apply it. If you are a motor truck owner this book will save and make money for you. If you are a prospective user it will tell you "Yes" or "No"—whether the purchase of a truck is a good investment.

A Small Investment But Big Returns

A single suggestion from the pages of this book may add five years of life to your truck. One new idea may result in hundreds of dollars saved. A system of routing, a plan for keeping cost records, for winning the co-operation of drivers—any one of these may result in increased profits that before would be impossible. Yet the price of this work is only $8.50. If it does no more than prevent a minor mishap, this much at least has been saved. But it will do far more than this—actually place in your hands the plans, methods, systems and ideas of thousands of successful motor truck users. You profit from their experience—you avoid the mistakes they made—you learn where and how they saved money, cut expenses and increased earnings. 530 pages—228 photographs—4 inserts—112 sketches—forms, diagrams, charts, tables and blue-prints—all yours for cutting delivery costs and increasing your profits.

Part I—Fitting the Motor Truck Into Your Business
Chapter I—The Field of the Motor Truck in Modern Business
Chapter II—When to Change From Horse to Motor Delivery
Chapter III—Comparing Cost of Horse and Truck Delivery
Chapter IV—How to Determine Cost of Performance
Chapter V—How to Keep an Effective Record of Costs
Chapter VI—Selecting the Right Truck for Your Work
Part II—Making Your Motor Truck Do More and Better Work
Chapter VII—Planning the Delivery System Right
Chapter VIII—Devices That Reduce Loading Time
Chapter IX—Effective Scheduling and Routing
Chapter X—Carrying More Goods With Special Bodies
Chapter XI—Principles Governing the Use of Trailers
Chapter XII—Using Trailers to Haul More Goods
Chapter XIII—Helping the Truck to Unload Effectively
Chapter XIV—How to Get Your Driver's Co-operation
Chapter XV—Supervising Your Truck by Mechanical Devices
Chapter XVI—Installing a Bonus System
Part III—Maintenance That Lowers the Cost of Upkeep
Chapter XVII—What Underlies Sound Motor Truck Maintenance
Chapter XVIII—How One Man Solved the Maintenance Problem
Chapter XIX—Saving Money Through Proper Lubrication
Chapter XX—Why Overloading Means Bigger Repair Bills
Chapter XXI—How to Curb Overspeeding and Other Abuses
Chapter XXII—How Tires Can Raise or Lower the Cost of Upkeep
Chapter XXIII—Selecting the Right Tires
Chapter XXIV—Solving the Garage Problem
PART IV—Building New Business With Your Motor Truck
Chapter XXV—Using Motor Trucks to Increase Profits
Chapter XXVI—How the Motor Truck Can Help You Meet Competition
Chapter XXVII—Using Motor Highways to Reach Distant Markets
Chapter XXVIII—Making Your Motor Truck Advertise Your Business
Chapter XXIX—Increasing Profits by Cutting Delivery Costs
Part V—Present Tasks and Future Problems
Chapter XXX—How Motor Truck Associations Help Truck Owners
Chapter XXXI—How to Meet Unreasonable Legislation
Chapter XXXII—Problems of the Future

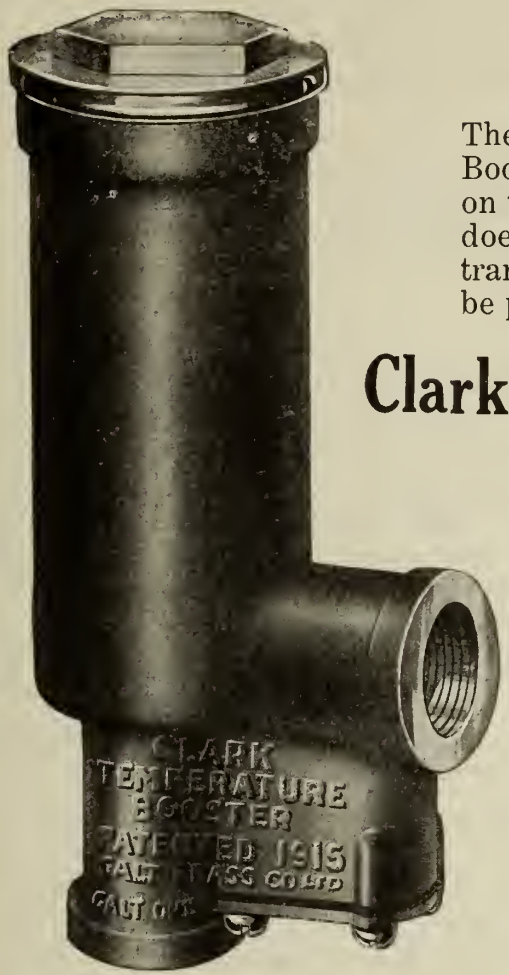
SAVE COAL



There's more selling points about the Clark Booster than any so-called heat generator on the market, because, in the first place, it does not generate heat, but it makes the coal transfer more heat to the water than could be possible unless you instal

Clark Temperature Boosters

Easily taken apart and put together again, and every part can be removed without it being disconnected from the system.

Easily installed. Can be fitted to any system in two hours' time. Requires only a few cents' worth of fittings, and is absolutely fool-proof.

No material in its make-up that can corrode, which cannot be said of most heat generators.

ONLY TWO VALVES NO SPRINGS

No mercury, no rubber or fibre washers that can be damaged, all bronze to bronze, and made right.

Every jobber in Canada handles the Clark Booster because there's no come-back, no trouble, no complaints to rectify. Every Booster we sell is perfect when it leaves our factory and is fully guaranteed to increase the temperature 15% to 20% over a straight gravity job.

Write your jobber or write us. It's all the same to you or us.

GALT, CANADA

Building Business During 1918

An Agency making a specialty of collecting building statistics reports that in the year 1918, there were buildings erected in Canada for residential, commercial and industrial purposes, to the value of about $97,000,000.00.

The thirty-five cities which issue building permits and make reports, account for about $36,000,000.00 of the same class of buildings in their territory, leaving a balance of $61,000,000.00 to be distributed over Canada in those sections of the country where no records or statistics are kept.

We call attention to this fact as it shows the wonderful opportunities there are for Sanitary Engineers and those engaged in the Plumbing business, in localities which are not immediately supplied with sewerage or water systems. Every one of these buildings, whether it is a residence, warehouse or factory, could be and would be better for having sanitary appliances, and we believe that everyone of them would have these conveniences if they knew how easily they were obtained, and how small the cost would be in comparison with the total value of the building.

The PORT HOPE SANITARY MFG. CO., LIMITED, would like to develop this class of work, and assist the Sanitary Engineer or the Plumbers. The policy of the Company is to have its goods installed by the regular Master Plumber, as we know that fixtures properly installed have an added value and give greater service.

For this reason we distribute our goods through the recognized channels, that is through the regular Jobbing Houses, and have them installed by the regular or skilled Master Plumber. The Company is willing and anxious to do whatever is possible to promote and develop this class of business, and will gladly co-operate with either supply houses or Master Plumbers in the way of furnishing literature, cuts, illustrations and printed descriptions of the very excellent line of Plumber's Sanitary Ware which we manufacture in our Factory at Port Hope.

This is the time for all who are interested to get together and make a bigger and better business for the year 1919.

Let Your Light So Shine

The Trade Should Devote More Time to Publicity — Manufacturers, Supply Houses Uses Modern Methods—Show Public the Importance of the Trade to Civilization—What the Profession is Doing and Has Done to Make This World a Better Place to Live in—Come Out of the Dark

By One Of Us

I HAVE been a reader of books on plumbing, on heating, and on all manner of sanitary science. I've read trade journals from every country whose citizens speak the English language; I've read translations from almost every known tongue in connection with plumbing and the plumber, and I've talked with men from France, Spain, Austria, Germany, South Africa, Australia and New Zealand, about the plumber, and they have all told me that they are, as a craft, the most slighted of all men. "A plumber, ye gods!" What a calamity to have to call in a plumber! I remember speaking to an Austrian about the time when he learned the trade in his own country, and then came to Canada. Said he, "I thought somehow that the English-speaking race had more respect for a man who had devoted five to seven years of his life learning a trade so as to be a good mechanic, and in that way be better able to serve those who required his services from time to time." But he found that it was the same in Canada as in Austria; the same in France as in England; in fact the same all over the world.

Now why all this bad feeling? Because without doubt there is a certain amount of suspicion in the minds of the general public towards sanitary and heating engineers (once designated as plumbers and steamfitters).

If the words in the Good Old Book could be counted for much, "By their fruits ye shall know them"—why, sanitary and heating engineers would be real top-notchers. But, as we have not shown the public the "fruit," we must not place all the blame on the general public. As we have not "let our light so shine before men," but have instead "put our light under a bushel," we must look in another direction before we resent any feeling of suspicion which the public have for us as a whole.

We have not shown the public all the power behind such an industry as is followed by us; we have not advertised as we should. For example: How many persons are there who have any idea as to how cast iron enamelware is made? The score and one processes that go to make up a perfect bathtub, a laundry tub, or a lavatory? How many are there who know that there are plants on this continent—more than one—that can turn out upwards of 1,000 bathtubs a day? How many persons are there who realize that in Canada there is a plant manufacturing sanitary and heating engineers' brass goods exclusively, that is the largest of its kind under the British flag? And how many realize that in actual fact a house is practically unfit for human habitation unless equipped with material made by our manufacturers of plumbing and heating supplies, and bear evidence of the work of our hands?

Mr. Reader, have you ever been in a moving picture show and seen pictures appear on the screen describing large ships being built and launched, the interiors of engine shops, views of munition factories, locomotive shops, the process of making panama hats, fountain pens, and the various canning processes, carried out in a score and one factories? Have you not in picture been taken from one end of the world to another? Many no doubt have viewed on the screen the wonders of the Panama Canal. This latter feat was made possible because of the skill of sanitary engineers.

But have you ever seen in screendom pictures the making of lead pipe, wrought iron and steel pipe, or the making of bathtubs, laundry tubs, and lavatories? I venture to say that no picture show has ever described the manufacture of brass goods, of cast iron soil pipe, the manufacture of range boilers, of radiators and boilers. The general public haven't the slightest conception of the great industries that are behind the plumber, the sanitary engineer, and the heating engineer.

Another industry which is very little thought of by the general public, but despite the fact is a wonderful industry, is that of the manufacture of pneumatic water systems. In fact very few of our own trade realize that pumps made for this purpose are of the finest type in the world—second to none. That is the reason why so many concerns who have attempted to make this line of pumps have failed; because they were of the opinion that pumps are all more or less alike. This is not so, however. This pneumatic water system business is in a class by itself, the pneumatic tanks are something different. I know of several boiler shops turning out some of the finest steam boilers in the world which took to making pneumatic water system tanks, but had to give it up. In fact, all through our industry, we, in the sanitary and heating profession, use manufactured products of a high order. Now, why not start something? Why not call upon our manufacturers to have some reputable moving picture film company take a number of reels off, describing their products?

Why not have "our lights so shine before men," and create in the minds of the general public a feeling that we want to serve them even better than we have done in the past, but that we must have their confidence and co-operation? Why not state our case in picture form as well as through the medium of the daily press? Why not co-operate with each other by having well-written articles appear in our home papers? Other industries are following out such plans, why not sanitary and heating engineers?

Here's a little story about a moving picture show. A story was being shown of the foolish things done by a plumber; he was called in to fix a pipe; he made holes all over the plumbing system, but the worst joke of all was where he started the gasoline torch and left the flame flowing forcibly against a lead pipe; the pipe melted and the water from the pipe flowed out in such a stream as to flood the building.

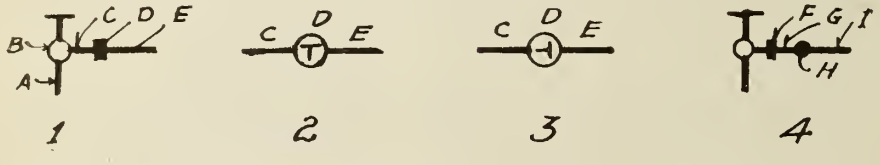
The writer heard a lady declare a plumber had actually done the same thing at her house. Of course the whole film was a low-down foolish lot of jokes on the plumber. But I've often wondered how many persons present ever gave it a thought that a paper bag full of water will not burn; and to melt a lead pipe under pressure of water would be impossible even in a blast furnace. But the point is, the public needs to be shown what is being done by the trade on the one hand, and we, every member of the craft, should endeavor to create a greater confidence. We should pay more attention to the class of men we employ;

encourage them to devote more time to study and to realize that, no matter what we say or do, the public is always right. And after all, are we not ourselves simply members of the general public? Very well, then, we should come out into the open and "let our light so shine."

PROTECTING HEATING PLANTS FROM FROST

By J. E. McCORMICK

DURING the cold winter months the chances of a pipe or valve being burst by frost are remote indeed in those plants which are used entirely for heating dwellings or for heating shops which contain goods or merchandise of such a nature as to become damaged even by slight freezing, but in isolated steam plants (and there are many of them throughout the country), used for mill or factory power, but not for heating dwellings, and which are therefore idle from Saturday noon or night until Monday morning, as well as during fourteen to sixteen hours out of every twenty-four during the week, the engineer must be more or less on guard against damage by frost, especially when the thermometer outside stands at many degrees below zero for a time, as is often the case in many Canadian localities.



There is also more or less chance of frost doing damage in those plants which, in addition to furnishing power, are used for heating shops or factories during working hours, the steam being shut off from the heaters and radiators during nights and Sundays. In such plants I have found the steam lines to be much more liable to damage than the water lines are. The water lines are shorter, and good insulation by means of some kind of covering will do much to protect them and they can generally be so planned that those which must necessarily contain water may, when they do get cold, or nearly so, be warmed up again by opening slightly the necessary valves and allowing water to flow slowly through them from towards the boiler for a little while. This will warm them up and leave them full of hot water again. A slight leakage through the lines, a drop or two per minute if otherwise permissible, will sometimes aid in maintaining the temperature of covered pipes.

But with steam lines it is different. According as the boiler cools down and the pressure goes off, the steam in the lines condenses. Generally a little leakage in the valves allows the most of this condensation to escape, and the remainder freezes in the lines in the form of a shelly ice or of a hoar frost. This is in lines not long enough to require to be trapped. My experience with such plants leads me to believe that except in exceptionally cold weather, covered pipes will not burst with this shell ice, and so long as the boiler is not fired enough at a time to raise any steam, and more especially if the accumulating air pressure caused in the boiler by expansion of the water, while heating, is allowed to escape through the upper gauge cock or other vent while the water is heating, said vent being closed again when the fire has been banked; then the boiler and the water pipes may be kept warm for days without danger of damage to the steam lines. If, however, any steam is raised, it is, in most of these layouts, imperative that enough be raised to thaw out all the steam pipes containing any of the shell ice and that care be taken to see that they are thawed out. I generally find that it is at the valves that the ice seal is most apt to exist and that some hot water poured over the body of these will thaw them enough to open, and this will allow steam to flow, which will soon thaw the intervening pipes. If steam is raised without the lines becoming thawed out before the steam goes off again water will form in the steam pipes and will flow into the spaces in the shell ice already existing and fill these spaces up; then, when this freezes, something is almost certain to burst. Of course if the valves next the boiler were absolutely steam tight no steam could enter the lines to condense them and do damage, but this ideal condition cannot be fully maintained without undue expense for renewal of valves and parts, hence, in general, the principle applies. I have several times known steam lines to suffer damage in this way and had similar experiences myself in plants I had charge of before I learned the real cause and its cure. It is noteworthy that in each of these instances the water lines remained intact.

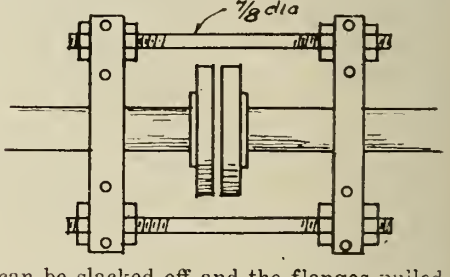
And now for a simple remedy, which obviously does not consist of maintaining a constant steam pressure on the lines, thus involving excessive standby consumption of fuel if kept up during all holidays. The instance sketched is for taking steam direct from the top of the dome or boiler if desired, but the principle can be applied to other positions. In Fig. 1, A is the upright nipple, B is an angle valve, C is another nipple, D is a three-way stop-cock, and E is the continuation of the line. The side outlet of the three-way cock opens to the atmosphere. In operation—during the time the line is in use, the stop-cock is turned to let steam pass directly through it into the line (Fig. 2). When steam is turned off the line by means of the angle valve B, the stop D is turned so as to give a free passage from B to the atmosphere (Fig. 3) and the line is also drained. Now any further escape of steam from the valve B passes out through the side outlet of D into the atmosphere and escapes instead of entering the line to condense and do harm. Any drip from the side outlet of the stop-cock D can be carried away by means of a neat metal trough. Fig. 4 indicates an arrangement calling for more parts but which may be preferred by or be more easily available to some. A, B, and C are as before; F is a tee; D is nipple, H is a globe valve, and I is the continuation of the line. The tee F is supplied with a nipple and a globe valve to provide an escape for leaking steam when B and H are closed. Perhaps quite a number of engineers can benefit as much by the use of this device this winter as I could have benefited years sooner had I known of it and its advantages then.

RENEWING WORN GASKETS IN LARGE FLANGE JOINTS

By S. E. Burd

It is a matter of some difficulty at times to renew joints in large pipe, especially in tight corners where space is limited. As will be seen from the illustration, four pieces of heavy flat iron are shaped to fit around the pipe as shown in the illustration and each pair are clamped on the pipe by ¾ in. bolts. These bolts have 15-16 in. fillers threaded on them so that the ⅞ in. rods will be an easy fit. The ⅞ in. rods are inserted while the fixture is being placed on the pipe and the nuts between the clamps are then screwed up. This forces the flanges apart to the proper distance and the new gasket can then be inserted easily.

After the gasket is in place, if there is no spring in the pipe the inside nuts



can be slacked off and the flanges pulled together again by the outside nuts.

After making this outfit it only takes one man a short time to repair a leaky joint. It can be used for different size pipes by putting packing between clamp and pipe within reason.

CONVENTION DATES DECIDED

The Ontario Society of Domestic Sanitary and Heating Engineers will hold their regular annual convention at the Canadian Foresters Hall, 22 College St., Toronto, on Friday, April 4th. Every member is asked to be on hand, and to keep clear of other engagements on that date. Further particulars will be published in SANITARY ENGINEER from time to time regarding the above event.

Pipe Sizes for Gas Installations

A Practical Schedule For Gas Piping Plans, Endorsed By Expert Gas Men — Sanitary Engineers Will Find This Article of Great Value in Arriving at Proper Pipe Sizes Necessary When Installing Same in Houses For Lighting, Cooking or Industrial Purposes

AT the Canadian Gas Association Convention held last August in Montreal, a number of very important technical problems were dealt with, and considerable discussion took place regarding the relationship between sanitary engineers, plumbers, etc., and gas companies.

It was felt that more co-operation between the two bodies of men would result in greater business and profits for both as well as a great deal better service for the public. One of the technical matters referred also to pipe sizes. Numberless cases were quoted where poorly laid out plans of piping were directly responsible for poor service of the various appliances. It was urged that if plumbers knew a little more about pipe sizes, when installing gas appliances, their customers would get better service from such appliances as are generally used in a home.

In fact several instances were mentioned, even in industrial plants, where the piping installed was too small. As the gas appliance did not appear to be working properly it was condemned, when the real trouble was that piping connected thereto was too small.

The following information, tables etc., are recognized as being based upon the best practices, and in fact these rules are in force in many large American cities.

Piping Schedule

In order to be of definite assistance to architects, engineers, plumbers and others, in the proper piping of all buildings for gas, the *National Commercial Gas Association* advises the use of the following piping schedule, as a conservative and sound basis of practice embodying all standards evolved to date. This schedule is offered by the association for use in all localities where pre-determined conditions do not otherwise obtain. This schedule may be relied upon as fulfilling all requirements of best practice. Gas fitters and contractors will be safe in working under this schedule, which provides equitable conditions for estimating, and insures the owner or occupant an ample supply of gas under safe, economic conditions, whether for illumination, power or heat. It must be understood, however, that the advisory services of the local gas company should be called upon in any territory to go over the schedule with the architect, and it is possible that they may make some suggestions to conform with local regulations or conditions.

Explanation of the Piping Schedule

This schedule is based on the standard formula for the flow of gas through pipes. The friction, and the pressure necessary to overcome the friction, increase with the quantity of gas flowing through; and as the aim of the table is to have the loss in pressure not to exceed 1/10-inch water pressure per thirty feet of length of piping, the size of the pipe increases from an extremity of the system towards the meter, as each section has an increasing number of outlets to supply. The quantity of gas the piping may be called on to deliver is stated in terms of ⅜-inch outlets instead of cubic feet, ⅜-inch outlets being used as a unit instead of burners. The consumption of gas through a ⅜-inch outlet is assumed to be ten cubic feet per hour.

In dwellings, the general practice is to supply gas to the range and water heater by a separate pipe leading from the meter to the kitchen. In case, however, it is desired to supply these or other appliances through the general house piping system, as in apartments or upstairs kitchens, the person planning the piping should apply to the gas company to obtain the value of these appliances in terms of "outlets," for use in determining the proper size of pipe from the schedule.

Directions for Using the Piping Schedule

In using the schedule observe the following rules:

(a) No piping between the meter and the first branch line should be smaller than ¾-inch.

(b) No piping should be smaller than ⅜-inch.

(c) No independent line, in the cellar or on the first floor, from the meter to a gas range should be smaller than one-inch; but when the range is supplied from the house piping, a ¾-inch outlet will suffice. Above the first floor, an independent line from the meter to a gas range on an upper floor should not be smaller than ¾-inch. No pipe laid underground should be smaller than 1¼-inch. No piping extending outside of the main wall of a building should be smaller than ¾-inch.

(d) No ceiling outlet, where the height of ceiling is twenty feet or more, should be smaller than ¾-inch.

SIZE OF PIPE IN INCHES

Required sizes of piping for various lengths and numbers of outlets.

If any outlet is larger than ⅜ inch, it must be counted as more than one in accordance with the schedule below:

Size of outlet in inches	½	¾	1	1¼	1½	2	2½	3	4
Value in ⅜-inch outlets	2	4	7	11	16	28	44	64	112

(e) In determining the sizes of piping, always start at the extremities of the system and work toward the meter.

(f) The lengths of piping to be used in each case are the lengths measured from one branch or point of junction to another, disregarding elbows or turns. Such lengths will be hereafter spoken of as "sections," and are ordinarily of one size of pipe. There are only two reasons for which a change in size of piping will be allowed in a section: First, where the length of a section is greater than the length allowed for the outlets being supplied; as for example, if a section supplying two outlets is thirty-three feet long, twenty-seven feet of this could be ½-inch, and the remaining six feet ¾-inch; second, where the required length from the outlets being supplied will cause a violation of clause "i" unless the size is changed.

(g) If the exact number of outlets under consideration cannot be found in the schedule, take the next larger number. For example, if twenty-seven outlets are required, the next larger number in the schedule, which is thirty, should be taken.

(h) For any given number of outlets, do not use a smaller size pipe than the smallest size in the schedule for that number of outlets. Thus, to supply seventeen outlets, no smaller size pipe than one-inch may be used, no matter how short the section may be.

(i) In any piping plan, in any continuous run from an extremity to the meter, there should not be used a longer length of any size pipe than shown for that size in the line opposite one outlet, as fifty feet for ¾-inch, seventy feet for one inch, etc. Exceptions to this rule are: First, when larger piping than called for by the schedule is run in following "j"; second, when fitter voluntarily runs a larger size than is necessary; as for example, if three outlets are to be supplied by sixty feet of piping, instead of fifty feet of ¾-inch and ten feet of ½-inch being required, the entire sixty feet may be of ¾-inch piping. When two or more successive sections work out to the same size of piping, and their total length or sum exceeds the longest length shown for that size piping, the change in size to a larger pipe should be made as soon as the limiting length has been reached. For example, if five outlets are to be supplied through thirty feet of piping, and then these five and one more, making six in all through twenty-four feet of piping, it would be found by the schedule that five outlets through thirty feet require ¾-inch piping, and that six outlets through twenty-four feet require ¾-inch piping; but as the sum of the two sections (thirty plus twenty-four, equaling fifty-four feet) is four feet longer than the amount of ¾-inch piping that may be used in any continuous run, the twenty-four-foot section must be changed from ¾-inch to 1-inch, four feet from the end of the meter.

(j) Never supply gas from a smaller size pipe to a larger one. If twenty-five outlets are to be supplied through three hundred feet of piping and these twenty-five and five more, making thirty in all, through one hundred feet of piping, it would be found by the schedule that twenty-five outlets through three hundred feet require 2½-inch pipe, and thirty outlets through one hundred feet require 2-inch pipe; but, as under this condition, a 2-inch pipe would be supplying a 2½-inch, the 100-foot section should be made 2½ inches. This does not apply to the case of a small pipe inside of a building supplying one outside of a building, which has been made large as per "c," because it is exposed to outdoor temperatures.

Gas Lighting

Occupants of houses that are fully piped for gas have, at their disposal, a wide variety of burners, artistic fixtures, reading lamps, domes, direct and semi-indirect lighting units. These fixtures are readily and conveniently lighted or extinguished by the pushing of a button or the pulling of a chain.

Apartment Houses

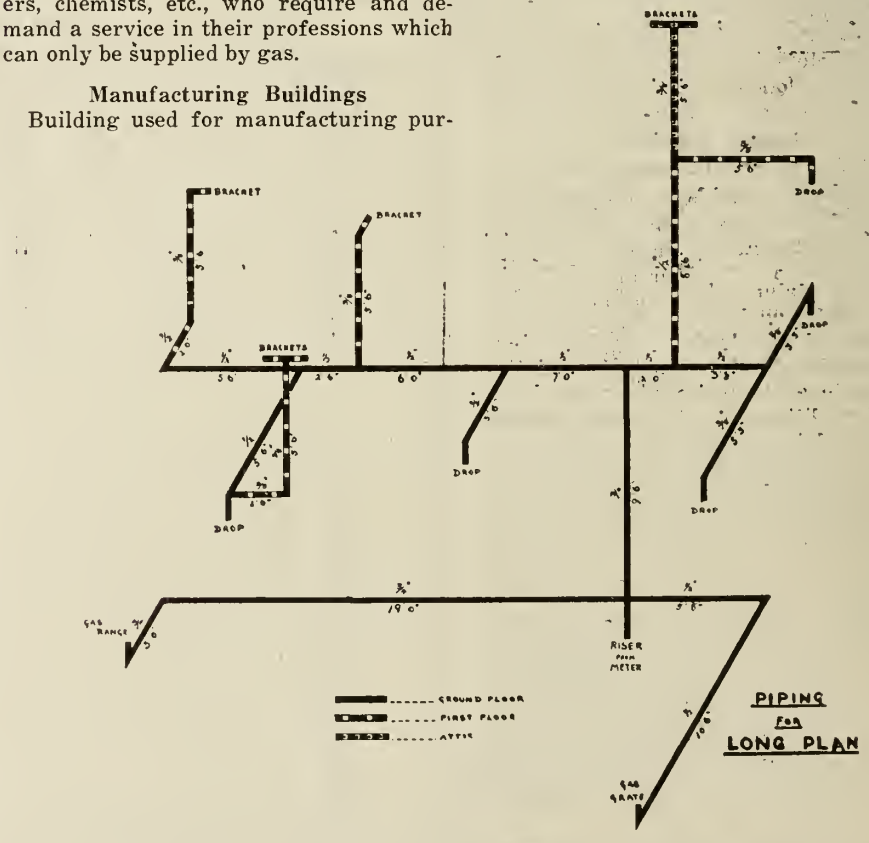
Practically all the uses, shown under the heading of "Residences," apply to each suite of apartments; and in nearly every case "all-gas kitchens" are installed. Incinerators are especially valuable in solving the garbage problem, and should be used.

Office Buildings

Office buildings are no longer exclusively confined to commercial use, but are being occupied more and more by dentists, oculists, barbers, manufacturing jewelers, chemists, etc., who require and demand a service in their professions which can only be supplied by gas.

Manufacturing Buildings

Building used for manufacturing purposes require piping of adequate size to supply the many appliances used in processes requiring heat, such as tailor's irons, singeing appliances, brazing, welding, melting, heating, etc. It is also particularly necessary to completely pipe these buildings for light, for the reason that gaslight is required where color matching is carried on, and in textile trades where the quality of goods must be determined.



School Buildings

Domestic Science Equipment.

Gas Lighting.

Gas water heating for showers in gymnasiums and baths.

Manual training room.

Laboratories.

Restaurant facilities for pupils.

Entertainment facilities for home and school associations.

Other Uses

There are numerous uses for gas in hotels, restaurants, cafes, cafeterias, clubs, churches, hospitals, stores, banks, which should all be considered and provided for in plans and specifications.

An interesting publication, issued by the association, is entitled "The Gas Equipment of the Home," which tells in an interesting way of the use of the gas in its relation to additional comforts in the home, and how, with artistic fixtures, it enhances the beauty of the interior and insures proper lighting.

Flue Connections

Local rules or regulations enter so largely into the matter of flue connections that no general practice may be stated in this respect. The person installing gas appliances should, in each case, communicate with the local gas company in regard to the different sizes and necessities of flues.

Vol. XIII. FEBRUARY 1, 1919 No. 3

CO-OPERATION NECESSARY

IN this issue there appear a couple of articles which refer to pipe sizes necessary if a good gas service is to be procured from fixtures that are installed. There are big profits to be made from the sale of gas water heaters and gas appliances, and if our readers will peruse the article on page 18, they will note just exactly how the various gas companies view the plumber and sanitary engineer. The article is really that part of a verbatim report which deals with the relationship between certain of our readers and gas companies, and to no small degree with the manufacturers of gas appliances.

Manufacturers of gas, that is, gas companies, are really in business to make and sell gas. That is their only product. Manufacturers of gas appliances are interesting purely and simply in the manufacture and sale of gas appliances. And some of these concerns have several hundreds of thousands of dollars invested in their business. In fact, the gas industry and all its strictly allied trades is one of the most necessary and important industries on this continent, if not in the world. Gas played one of the most important parts in the war, for heat-treating and tempering of shell billets, forgings, material and for tool tempering. To-day gas is absolutely an essential and it is only beginning to come to its own. Very well, then, take that for granted, is it not logical that we, who are so closely related to the gas appliance industry because our class of skill is required to install such appliances, that we should seek to know more about the requirements as to sizes, etc., when piping a house for gas? It was admitted at the Eleventh Annual Convention of the Canadian Gas Association that, as a craft, we were the most logical businessmen to handle gas appliances, but it was also proved, in all fairness, that sanitary and heating engineers had in the first place really forced the hand of gas manufacturers and appliance manufacturers to go over our heads so as to stay in business. This is a straight statement of conditions which should not be allowed to continue. There were many men present representing gas companies from all over the Dominion and the United States who declared that they would be by far the most pleased to see sanitary and heating engineers become better salesmen and better versed in methods of installation and requirements in connection with gas appliances. And with a view of furnishing some information to our readers an article appears on page 15, referring to certain matters in relation to pipe sizes, etc. Several articles will appear in future issues of SANITARY ENGINEER on this subject.

A RADICAL STEP

A SOMEWHAT radical step which is being watched with keen interest by retailers across the line is the Socialistic measure introduced in the legislature of Massachusetts for State insurance. The proposal calls for the appointment of a commission of five competent persons to investigate the matter of State insurance, and to devise a plan whereby the State may issue policies of insurance to the citizens. The commission is to report not later than May 1. People have the money.

THREE BIG FACTORS

ONE of the most important things in connection with business to-day is the sales force. The sales force includes more than your clerks and salespeople. Your show windows and your advertisements, if properly handled, can do just as much for you in quickening turnover, more in many cases than your sales staff can. Every good window display will produce direct results and the same can be said of forceful and timely advertising. An advertisement does not need to occupy a whole page of space to deliver its message. The combined efforts of a well-trained sales force, a well-dressed window and a well-worded advertisement makes a combination that cannot fail to increase business.

IT IS being suggested that the Prince of Wales should get a wife in the States, as the stock of princesses is running short in Europe. Well, why not let the chap get out and hustle and find a wife for himself?

Should Co-operate With Gas Co's

Part of the Proceedings Which Took Place at the Eleventh Annual Convention of the Canadian Gas Association, Held in Montreal Aug. 22 and 23 Last—Sanitary Engineers Can No Doubt Make More Profits by Co-operation With Gas Allied Trades and Companies

ON more than one occasion we have endeavored to secure the co-operation of plumbers in regard to installation by offering to let them carry a stock, we furnishing the appliances to them at cost, and they to do the piping, but in no case was it satisfactory, because there was always someone with no scruple in the matter of the quality of the work, and we would find a half-inch or a three-quarter-inch pipe carried up three or four stories to supply several tenements. Perhaps the stove in the upper part of the building would get good supply, while the others would have very indifferent service.

On another occasion an attempt was made to have all the plumbers take on the sale and installation of gas appliances, but we were told that such a proposition would only be considered on condition that the company discontinued the sales of appliances or the installation of any piping other than the services between the mains and the meters.

Mr. Dains: The appliance man has not a bed of roses by any means. We find that in every community there is always some element of local condition that makes it difficult to do what you want to do.

Take our own local situation. I would like to see someone make a dent into the conditions which we meet with. The Gas Company sells a stove and they send it to the factory, and the wagon delivers it to the door. This is being done in the Dominion of Canada and in the United States. You cannot get every plumber, but if there are five hundred, and you have four hundred, then you have four hundred salesmen on your proposition. One of the advantages of the proposition is that the dealer need not carry any investment in his store.

The Gas Company may say, "We will loan our display so that you have absolute control. Take your order and we will take care of it, and we will do the connecting as well. No plumber has ever refused to accept five dollars when it comes to any offer on the part of the other party.

That is the co-operative plan that I have in mind. A dealer sells only the appliances that the Gas Company sells itself, and he does not go outside. He has to take care of the work, and sell at the Gas Company's price, plus commission.

The consumer may feel that something is being taken away from him, but the Gas Company is doing the work it started out to do—promoting gas sales. Whether they do it with individual men, or with the dealer, I say that it is possible to get departmental stores to do it.

You might not accomplish this in a day. I have been calling on people for ten years, and I have found that it is the "everlasting go to it" that accomplishes the results. You can get 100 per cent. of the dealers the material you advocate. You can sell anything that is useful if you go after the business right.

Mr. Martin: I have been a commercial man all my life. Any business or section of any business that is operated at a loss is fundamentally wrong, and therefore I have always endeavored to sell goods and sell them right. They ought to carry a profit sufficient to cover the anticipated following expenses of operation.

As has been said here, it is a very hard thing to do in the way of upkeep after the sale is made. There should be some means, however, of arriving at an arbitrary figure and add to the cost of the appliance, because it is that particular appliance that gets the benefit of the upkeep.

In the matter of co-operation with dealers I have had fifteen years' experience. We did everything possible to give the dealer the long end of the stick and make him satisfied.

We found that the minute you suggest to a dealer that he sell the same type of appliances that you are selling, under the same name, the dealer at once realizes that he has no individuality. He is merely a tool of the gas company.

That is practically what you aim to do, anyway. The dealer wants that individuality; he wants a different appliance to sell. His ideas and knowledge of those appliances is very limited. He takes the salesman's talk as to what the appliance is and what it will do.

Well, now, a lot of these salesmen are good fellows, and they go and sell a dealer something that he ought to get—something that he can sell at a great deal less than the gas company's appliance, and he will sell as much as he can, but to get him to sell your appliance with your name on it is to make him lose his individuality, and he is accused of being a tool of the gas company.

We have never been successful in having this so-called co-operation through either a plumber or departmental store or any class of merchandising institution.

Mr. Elcock: Three years ago we tried a co-operative plan with the plumbers. We supplied them with sample ranges, show cards, advertising data, and allowed them a margin of profit. They were to retain the samples. They booked the orders and supplied us with the contracts, and we filled the orders.

Our experience in that case has been very disappointing. The numbers sold were comparatively small, and I do not quite agree with what the last speaker said, that the majority of the public thought the plumbers were working hand in hand with the gas company. I know our results were very disappointing.

Mr. McIntyre: It seems to me, after all that has been said this morning, that the feeling of the general public towards the service is a sort of suspicious one on the part of the consumer. Now, that should not be. If the gas company can get the public to buy appliances from it, and give the public satisfactory service, and have a satisfied consumer, he is a good asset for any public service commission. And it is the same thing with the plumbers.

If you get the plumbers and dealers to work with the company, and the consumer gets a better service by buying the same appliance from the plumber, I do not see why anybody should look with suspicion upon the plumber.

Mr. Gerry: Following upon Mr. Martin's remarks we tried several times to have the plumbers handle our appliances on a commission basis, and it proved that the sales were very small.

Since that time our endeavors have been along the lines of having them handle a good grade of appliance and to make proper installations, and it has been far more successful.

Mr. Newsome: I do not know that I really have any license to speak to this audience, but I have heard a few rather uncomplimentary remarks about the plumber.

I represent the plumbing trade. It seems to me that all that is wrong with the plumber is that he is not yet a merchant. Don't you think that if the gas people—the manufacturer of gas stoves and appliances, and gas companies as well, did a little towards telling the plumber that he is not a merchant—tell him that he must become a salesman, you will accomplish quite a lot?

I met one individual a few years ago in Toronto and I said to him, "Why don't you go into the gas water heating business?" He said, "I cannot do it." I said, "Why?" He said, "It is because of the fact that the gas company can undersell me and does every time. If I sold at their price there would be nothing left for me, considering the few I sell in a year."

I asked him, "How many do you sell in a year?" He answered, "Two or three." I replied by telling him that that was not even attempting to sell gas water heaters. "Why don't you get right down to business, use your store window, make a display of gas appliances and sell

enough to reduce your overhead expenses?" He did so, and after that the young fellow sold twenty-two gas water heaters in six weeks.

We are told that they should not buy appliances that will not give good service. On the street I live on I met a man who told me that he had a gas hot water heater in the house. He told me that he bought it two years ago and it was no good.

I said, "Why didn't you buy a good one? You did not go to the gas company for it?" He said, "No, I bought it down at ———" (naming a departmental store). And naturally I told him he should have bought one from either the gas company or a reliable plumber, but he complains that their prices were too high, etc.

The plumbing trade cannot afford to sell cheap goods, and they have that same object in view, viz., service behind each sale. I think the gas companies should try to educate the plumber and make him more of a salesman.

I was particularly pleased with the remarks of one of our friends (I think it was Mr. McIntyre), when he said that it seemed strange that the plumber did not pull with the gas companies. It seems to me that they can be made to pull if they are educated. I would not take a ten dollar bill if I did not earn it, and I think a plumber who did so should not be in business.

If the plumbers became merchants they would lower their overhead expense, and I think we should all co-operate by trying to get them to become merchants, and I am sure if I can get any member of the Gas Association to help me in any way, by writing articles suitable for SANITARY ENGINEER, our paper is ready to do all it can. It is at your disposal.

Regarding the question of cheap goods and installing of same, I will relate what happened just recently. One of our readers phoned me and said he was glad that he had taken the advice of SANITARY ENGINEER regarding the question of selling rubber hose for connecting a two-ring gas plate. A customer of his wanted to buy a rubber hose for that purpose and he suggested connecting it up with iron. But when the customer learned that it would cost $2.75, the customer (a lady) replied that she would go to ——— and buy a rubber hose. She did and is now in her grave. She was the person who was reported as having died from gas poisoning; the rubber hose had begun to leak, etc. My friend the plumber vowed then that cheap gas appliances or anything of a temporary nature would play no part in his business so far as gas appliances were concerned.

Mr. Wallace: One of the difficulties to bring about co-operation with plumbers is the lack of knowledge and the indifference on the part of the average plumber as to the requirements for the proper installation and adjustment of gas consuming appliances. We would have to start and educate the whole plumbing fraternity as to what is required, and I feel we should just as well do that in our shops. Any difficulty that the plumber has is invariably referred back to the gas company.

Mr. Dains: Mr. Wallace just struck the nail on the head. You have to do it, anyhow. Why not get co-operation started? I had an experience when I drove twelve miles to see a plumber who took an order away from me. I went twelve miles out of my way and I received a setback. The plumber told me, "I have forgotten more about that appliance than you ever knew." I said, "Thank you. If you need me send for me."

Three weeks later I got a telephone message to "please send another heater to this point." I did not ship it.

He paid thirty dollars for his experience, and I said, "Mr. Plumber, I could give you this without any cost, but I am going to charge you thirty dollars because you knew it all."

Mr. Johnson: In regard to service, and whether it should be charged directly to the sale, I think that a certain part of it should be, but it is something that each company will have to determine for itself, what part should be charged to commercial or new business department.

In regard to industrial appliances, the amount of profit varies, and I do not think you can fix a certain amount of profit in that case. I do not believe that you should put a great amount of profit on industrial appliances, but I also do not believe in selling at less than cost. You should get a small profit out of them, but take all the lines that you handle, and the percentage of profit varies, and it is the same with all merchandise. There is one thing we should try to remedy, but I believe you find it more in the electric than you do in the gas business, and that is the low re-sale price set by the manufacturer. Of course with the gas business there is comparatively little of it.

In regard to the co-operation of the departmental stores, we have found that they are the hardest people to control in the line of prices. It is not only in gas lines, it is in all lines. There are certain departmental stores that some manufacturers will absolutely refuse to sell for the reason that they will state they will re-sell at a certain price or higher, but they will cut the bottom right out. There are a lot of such stores today who will do the same with gas stoves, and who will not live up to any agreement as to the sale price of gas ranges.

In regard to the co-operation of the plumber, we worked on that line several years ago, but were never satisfied. We are situated differently from most of the companies on account of the size of the city so have opened up branch stores, and are very much in favor of them. They are working out much better than by co-operating with the plumbers.

I believe in co-operating with the plumber in every way, providing satisfactory working agreements can be arranged.

One thing that has not been brought out, which I would like to see taken up, is that in regard to the neutral line of goods that gas companies can handle. It is really surprising how that will help to pay the expenses of your sales department. It is something that takes up very little of your floor space or capital investment. The profit is fair, and interests the women. We have cases where they come in to buy a small aluminum dish or kettle for $1.39, and before they went out we would sell them a range to go with it.

The President: I want to thank Mr. Johnson for his paper because it has brought about a most interesting discussion.

Now, our next paper is one prepared by Mr. E. H. Caughell, manager of the St. Thomas Light, Heat and Power Department, St. Thomas, Ont., entitled, "Standardization and Inspection of Piping Installations." Mr. Caughell has been called away, and I would like to have Mr. McIntyre read this paper.

(Mr. McIntyre reads paper.)

(See page 23, September 2nd issue.)

The President: We are open for discussion, gentlemen.

Mr. Wallace: Mr. Caughell in his paper has, I think, revived some points of ancient history.

There was a time when the gas companies had an established rule for the installation of piping, and some of them maintained a pretty rigid attitude as to what they would or would not do. I remember that no meter would be connected unless the piping had been inspected by a company representative, and the consumer would have to wait for a supply of gas until these specified conditions had been complied with.

Competition forced us to recede somewhat from that attitude, and the desire to secure new business or hold what we had, is in part to blame for the present situation. The old time standards would hardly apply to-day, and the suggestion brought out by Mr. Caughell is one that ought to be given every consideration.

Mr. Dion: If in the opinion of the gas managers such a regulation is necessary, it is evident that it should be general, and that each company should not have a specification of its own. Whether we think so or not, it seems to me that it is a matter of time only before such regulations will be enacted by the municipalities just as they have done with regard to buildings, plumbing, etc. In fact, I understand there is a move on in a quiet way to induce the cities to pass such legislation.

Now, if this is done it may be done in a way that we would not like. Men who are competent to advise in the matter may not be the ones chosen. It may be left to architects, many of whom have not given very much study to that part of building construction and conditions, and regulations may be put on the books which will be unsatisfactory to the gas companies.

Following the line laid down by other associations, it would seem to me, if it is the opinion of the managers here that such regulations are desirable, that we should anticipate such regulations on the part of the municipalities, because they could not get anything better and more

practical than those emanating from this association.

It just occurred to me that it might be a good thing for the chair to appoint a committee to consider the matter during recess, and bring in some report at the next meeting of this association.

Mr. McIntyre: The executive took that matter up at a meeting not very long ago. Mr. Allen can give you any information that you desire, but the only feasible way to have a standard installation would be to have it come through this association.

The city council at Kitchener two years ago drafted a by-law in regard to gas piping, and the inspection was going to be made by the building inspector, but the reason the by-law was not finally passed was because they could not get a really standardized rule covering every case, at least at that time. I think if the matter was taken up by this association and the rules adopted by the association, there is no doubt that every gas manager could get the city to pass a by-law.

Mr. Forstall: It might be a help to the secretary to look over a book of that type which the A. G. I. published some time ago.

Mr. Allen: I might mention that at the last executive meeting I brought up the question regarding gas piping specifications. Mr. Stotz, of the National Commercial Gas Association, wrote me stating that he thought that the Canadian Gas Association ought to co-operate with the N. C. G. A. He said it had gone to the expense of having four pages of specifications inserted in Sweet's catalogue, an architectural specification book published in the United States, but it felt that it could not extend the work into Canadian territory, thinking it was our duty as a Canadian Association to interest our own people.

There was a representative of the Canadian Specification Data Company, Limited, at that executive meeting, who was ready to give his ideas as to what he was ready to do for the Canadian gas men in the way of interesting the Canadian architect and builder in gas piping and appliance specification data. He said his company was willing to copy the American gas specifications.

His charge was rather high for such service, so a recommendation was brought in that the secretary get a price on what the four pages would cost in booklet form, and have them mailed to the architects of Canada. This booklet would show the architect the specifications as adopted by, not only the American Gas Association, but also by the Canadian Association, and ask them to follow these specifications as far as they were able to do.

Mr. Hewitt: They are copyrighted by the American Gas Association, but I have no doubt we could get their permission to reproduce them in booklet form. I think they are the best extant. They are the best in the country.

Mr. Forstall: I think the specifications referred to were gotten up by the American Gas Institute and the National Commercial, and they are largely along the line that was adopted by this Bureau of Standards to establish a gas safety code which was to embrace every feature of the business of supplying gas as it related to the consumers. One section of the safety code was practically complete when the Bureau of Standards got so very busy on war matters. There is nothing being done with it at all now and will not be done until the war is over. After that I suppose it will be taken up again, and when it is drawn up by the Bureau of Standards I think it will be found that the Bureau of Standards are willing to accept the advice of the gas men as long as they are not detrimental to the consumer, and it will represent the best advice on the subject of house piping and appliance connection that is to be had in the United States, and ought to be worthy of adoption pretty well all over the Continent.

Mr. Grace: With our gas inspection department taking the same attitude as the Bureau of Standards, might not the Canadian Gas Association make strong representations to have them institute regular proper specifications, and in that way you would have federal control at the suggestion of the gas men. They have on one or two occasions changed the standards to suit the conditions. I think they would do the same in the matter of controlling specifications and piping.

Mr. Dion: I quite agree that the American specifications mentioned are probably the best we could get, and when the war is over and the Bureau of Standards finally adopts them, we could most likely adopt them ourselves, but I want to anticipate any action on the part of municipalities which might bring in specifications unsatisfactory to the gas company.

Is it not possible that a committee of this association could take the specifications of the Bureau of Standards as far as they have gone? I understand as far as piping is concerned it is almost complete, and we could formulate a code which we would have ready for action in case a municipality proposed something else, without our waiting for final action.

What would be the result if a town or city council were to adopt a code which was detrimental to the interests of the gas company? The manager of the local gas company may have a code satisfactory to them and he would be most likely to get them to accept it. It would show the council the authority behind the code.

I suggest that the association as such should have ammunition of that kind ready for any conflict that may arise, and it occurred to me that a committee composed of men best able to handle this thing might be nominated at this meeting, and keep the question before them, and if occasion arose they could take action.

Mr. Byrnes: We are forced to establish a hard, firm, set rule as to the size of piping, and we met a great deal of opposition from the plumbers. We tried our very best to have the municipality appoint an inspector, and we have tried everything along the lines that Mr. Forstall mentioned, as to what the size of the pipe should be. I have these now in pamphlet form, and will be glad to send copies to anyone interested. We found in our experience that any deviation from that line in the size of pipe will get the gas company and consumer into trouble, regardless of what the plumber says or does.

The President: We have with us Mr. Newsome, editor of the SANITARY ENGINEER, who has something to say to us on this question.

Mr. Newsome: This subject is very interesting to me indeed. I have been advocating the adoption of a gas by-law for the last five years. A few days ago I met a member of the Toronto Society of Sanitary Engineers, and he said to me, "I understand you are going to attend the Gas Association convention." He told me that the trade did not know anything about the size of piping.

I tell you what we will do. We will undertake to publish every practical article that any member of this association will furnish us for publication in the SANITARY ENGINEER, free. We will publish them word for word, and will hold the type and we will give your secretary a price on reprinting same in booklet form. You shall not be charged one cent more than the cost. We know that such articles as would come from the pen of you gentlemen would be interesting as well as educative, and every reader of SANITARY ENGINEER would greatly benefit by reading such articles.

We will also publish editorial articles written for the purpose of pointing out that there must be more co-operation between gas companies and plumbers, and that the benefit would be mutual. If SANITARY ENGINEER can serve the gas associations or gas companies it is right here to do it at no cost, because we know the plumbers want the information which can best be procured from you. If I could find out the man who put in a one-eighth inch pipe to an appliance consuming sixty feet of gas per hour, I would tell him that he should not be in the plumbing business.

We will do anything we can to help you out, and it is up to you. If I do not get some information from you people that will help improve relationship between gas companies and plumbers I am going to write and tell you that you are a lot of slackers. (Laughter.)

Mr. Wallace: In connection with my former remarks as to the knowledge of the plumber of the proper requirements in the connecting and adjustment of gas appliances, it is perhaps only fair to say that in the particular case mentioned the fitter, not having experience in that line, was misled by the size of the delivery orifice which was furnished with the appliance, and had assumed that because the nozzle was of small diameter that a small pipe would be ample; on finding that he could not keep the flame from flashing back he removed the air mixer altogether and connected the gas pipe direct with the burner.

New Canadian Patents

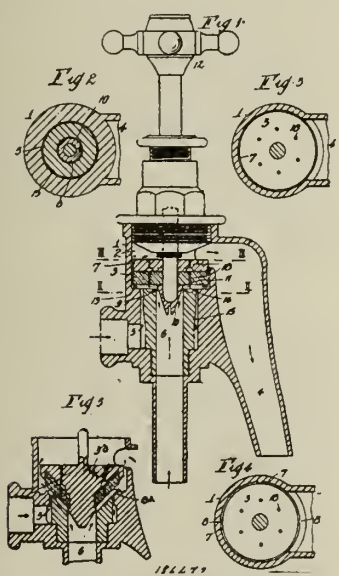
No. 186,472

Peter Stewart Hanton, Kew, Victoria, Australia, 10th September, 1918; 6 years. Filed 18th September, 1917. Receipt No. 285,406.

Claim.—1. In steam heated water supply systems, valvular means whereby independent supplies of water and steam are approximately simultaneously admitted into a mixing chamber, and means whereby the fluids are caused to flow together in a thin film from the independent sources to the mixing chamber.

2. A mixing valve for steam and water comprising a valve casing having a seat therein defined by a circular wall, steam and water supply conduits opening on the base of said seat, a circular valve of slightly less diameter than said circular wall arranged in said seat and forming with said wall a narrow annular passage, and means for moving said valve vertically to control the flow of fluids from said conduits.

3. A mixing valve for steam and water comprising a valve casing having a circular seat therein defined by an upstanding circular wall, a steam supply conduit opening centrally on the base of said seat, a water supply conduit surrounding said steam supply conduit and opening on the base of said seat, a circular valve of slightly less diameter than said wall arranged in said seat and



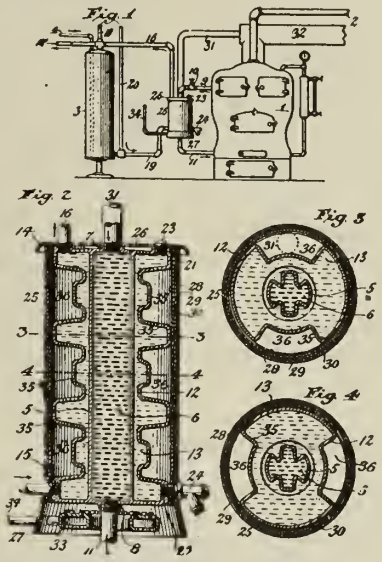
186,472. Mixing Valve for Steam Heated Water Supply Systems.

forming with said wall a narrow annular passage through which the mixture of steam and water passes, and means for moving said valve vertically to control the flow of fluids from said conduits, said valve when raised being disposed within said wall, whereby the fluids pass through the annular passage in a thin film.

No. 185,416

Calvin Page Wadley, Buffalo, New York, U.S.A., 9th July, 1918; 6 years. Filed 3rd April, 1918. Receipt No. 293,034.

Claim.—1. A water heater comprising an inner heating chamber adapted to be connected with the water space of a boiler, an outer heating chamber surrounding said inner chamber and adapted to be connected with the fixtures which are to be supplied with hot water, and a burner arranged to deliver a flame against said outer chamber.



No. 185,416. Water Heater.

2. A water heater comprising an inner heating chamber adapted to be connected with the water space of a boiler, an outer heating chamber surrounding said inner chamber and adapted to be connected with the fixtures which are to be supplied with hot water, a burner arranged to deliver a flame against said outer chamber, and a casing enclosing said chamber and burner.

3. A water heater comprising an inner heating chamber adapted to be connected with the water space of a boiler, an outer heating chamber surrounding said inner chamber and adapted to be connected with the fixtures which are to be supplied with hot water, a burner arranged to deliver a flame against said outer chamber, and a casing enclosing said chambers and burner, and provided at its lower end with an inlet for air and an inlet at its upper end for the escape of products of combustion.

4. A water heater comprising an inner heating chamber adapted to be connected with the water space of a boiler, an outer heating chamber surrounding said inner chamber and adapted to be connected with the fixtures which are to be supplied with hot water, a burner arranged to deliver a flame against said outer chamber, and a casing enclosing said chambers and burner, and provided at its lower end with an inlet for air and an outlet at its upper end for the escape of products of combustion, said outlet chamber having its wall constructed of a plurality of transversely elongated or oval sections, each of which is arranged with its narrow ends closed to the body of said casing while the opposite sides thereof are separated by intervening passages from said body and the several sections being arranged so that the narrow ends of one section are vertically in line with the passages between the casing body and the wide sides of adjacent sections.

SHOULD CO-OPERATE WITH GAS CO.'S

Continued from page 20

Mr. Grace's suggestions as to the matter of regulation, and Mr. Hewitt's comments as to the impossibility of bringing that about, might be overcome if the association would establish a line of standards and then submit them to the Public Utilities Commissions. I know from experience that our provincial Public Utilities Commissions are prepared to recognize and appreciate any suggestion that the association will make for the protection of the gas consuming public.

Mr. Martin: I do not see why you should fear any antagonism from municipal corporations. We do not have any difficulty in that direction. Of course we benefit by the experience and intelligence of the men connected with the United Gas Improvement Company, who furnish us with a small booklet which we in turn distribute to the architect. We see him personally and explain what we are trying to do. We give each plumber in the town one of them, and explain anything he wants to know to him. We have difficulties at times, due not so much to the master plumber as to the operator. We furnish him with that book, and the architect puts a clause in the specification, "The house piping must be put in according to the rules and regulations of the Des Moines Gas Company."

Our inspector comes around to the house, and if he finds that the specifications have not been followed out he refuses to set a meter until the line is made a proper size.

We had no difficulty whatever with our municipal authorities. They do not know anything about it. They have to take your word for it. Their interest is only to know that the consumer or public is going to get satisfactory service.

Market Conditions and Tendencies

Statements Regarding Supplies and Trend of Prices

THE MARKETS AT A GLANCE

PIPE fittings have come in for a further revision downward this week, and new prices named provide for quite a substantial reduction from previous levels. Wrought pipe shows no further change from that noted last week.

After two or three weeks of uncertainty as regards decline to be made, new prices have finally been determined upon for boiler tubes. These show a general decline of about 10 per cent. This is not the result of an accumulation of supplies, for although shipments are coming along better there are still some sizes not represented on the stock sheet. The past few weeks have seen a heavy demand for tubes, and offerings have been quickly absorbed to keep stocks at a low point.

Further declines have been recorded in jobbers' prices of both galvanized and black sheets. The former have come down 80c per 100 pounds, and the black are down from 50c to 80c. It is indicated that basis now established is right in line with figures at the mills, and no further recessions from quotations adopted are expected unless the mills undertake a further revision in their prices. The tonnage coming to hand is considered very good.

Ingot metals show a general revision downward, copper, tin, lead, spelter and antimony all being affected. Dealers feel that the bottom has been reached for the present. Solder is also down, but no further change in manufactured lead products is reported, though lead traps and bends reveal a weaker tendency.

Range boilers have not been changed, but the feeling prevails that a lower basis will be established before long. Enamelware generally is firm, though some slight revisions in pints have been made. Cotton waste seems due for a slight decline, probably 1c to 2c per pound, according to grade. Oakum is unchanged.

TORONTO, January, 29—Pipe fittings have been revised to lower levels, taking effect February 1. Some slight changes in roll rim and flat rim sinks are also noted. Solder is lower and declines have been general in ingot metals. The feeling is general that bottom has been reached on metal for the present and the trade is keen after business to-day.

Easier Feeling In Range Boilers

RANGE BOILERS—An easier feeling is reported in range boilers, although no price revisions have yet been made. The feeling prevails that lower prices must be named and that declines will be recorded in the near future seems probable.

	Standard	Extra Heavy
30-gallon range boilers	$14.00	$17.00
35-gallon	17.00	20.50
40-gallon	20.50	24.00
52-gallon	28.00	32.00
66-gallon	37.00	42.00
82-gallon	45.00	50.00
100-gallon	62.00	70.00

Prices on Sinks Show Revision

ENAMELWARE—Prices on sinks have been revised, the roll rim being down slightly, whereas flat rim are up a little bit. Quotations now being named to the trade on the roll rim are: 16 x 24-in., $12.00 each; 18 x 24-in., $12.30; 18 x 30-in., $15.05; 20 x 30-in., $16.15. The flat rim are quoted for the 16 x 24-in. at $16.00 each; 18 x 24-in., $16.20; 18x30-in., $15.05 and 20 x 30-in., $16.15. Other lines of enamelware show no change and the market is holding very steadily. Labor is the main factor in the cost and on the present scale of wages no material change in prices of the manufactured product is looked for.

Bath-tubs, roll rim, 4, 4½, 5 feet, 24 to 30 in. wide	$32 10
Bath-tubs, 5½ ft.	35 70
Basins, flat back, 11 x 15 in.	6 00
Do., corner, 15 in.	5 95
Sinks, roll rim, 18 x 30 in.	15 05
Closets, oak tank and seat	27 00
Do., enamel iron or white vitro tank	29 00

Pipe Fittings Down; Soil Pipe Holds

SOIL PIPE, FITTINGS — A general revision in pipe fittings, both malleable and cast, effective February 1, has been made and quotations now being made to the trade are: cast iron fittings, 12½ %; plugs, 22%; bushings, 28%. Standard unions are unchanged at 35%. Malleable fittings, class A, black are lower at 53c per pound; class A, galvanized, at 66c; class B, black, at 24c; class B, galvanized, at 33c; class C, black, at 16c and class C, galvanized, at 24c.

No change has been noted in soil pipe and fittings: the market holding quite steadily at unchanged figures. Quotations range at following levels:

SOIL PIPE AND FITTINGS

Medium and extra heavy soil pipe, 2 in. to 6 in.	15%
Medium and extra heavy fittings, 2 in. to 6 in.	25%
8 in. soil pipe and fittings	Net list

C. I. PIPE FITTINGS

Do., Class C, lb. net	0 16	0 24

Valves Hold At Unchanged Levels

VALVES—No material change in the situation on valves is reported. There is little buying interest just at present and a revision to slightly lower levels may, it is indicated, develop at an early date. In the meantime quotations hold at following figures:

	Discount off list
Ground work	40
Compression work, standard	45
High grade	41
Cushion work	40
Fuller work, standard	43
High grade	36
Basin cocks, No. 0 standard	38

Patent quick opening valves	30
Basin Cocks—	
No. 0 and 1, Fuller pattern	43
Globe, angle and check valves, standard, medium pressure	10
Radiator valves, standard med. pressure.	30
Radiator valves, removable seat, medium pressure	25

Waste To Go Lower; Oakum Holds

WASTE, OAKUM—No price revisions have yet been recorded in waste, but indications point to declines of from 1c to 2c per pound according to grades. Some expect new prices at an early date, whereas. others look for present basis to be maintained for another month or six weeks. Lower prices may be said to be on their way at any rate.

Oakum remains at unchanged levels. Some shading of prices on plumbers' is reported, but this does not seem to be general, $10.00 being price most often heard. Prices ruling are shown herewith:

	Per 100 lbs.
Best American	$21 00-$22 00
Clipper, spun	-21 00
Do., unspun	-10 50
Plumbers', spun	10 00-10 50

Wrought Pipe Prices Holding

WROUGHT PIPE—Wrought pipe reveals no further price changes from those noted last issue and the trade generally has settled down to the new basis and is now keen on developing new business. The present scale of prices appears in panel herewith:

WROUGHT PIPE
Price List No. 38—January 6, 1919.

Freight equalized on Chatham, Guelph, Hamilton, London, Montreal, Toronto, Welland.

Boiler Tubes Register Decline

BOILER TUBES. — Reductions have taken place in the price of tubes and these appear to be voluntary on the part of some of the sellers. There are no large stocks on hand either here or across the line. In fact there are some sizes that are not represented yet. There has been for some weeks past an unusually heavy demand for tubes, and this tends to keep the stock on hand at a low mark. Instead of the old tube list standing with ten per cent. off a new list was handed out a few days ago, making 2-inch lapweld tubes $32 per 100 feet against a former $36. It may be that still lower prices will come in tubes, for they are still a long way ahead of the pre-war prices, but these will, it is thought, come along gradually. It is doubtful if even after the lapse of time and much readjusting prices will ever come down to pre-war levels. By November of 1915 the price had shown only a nominal advance. After that the rise in price amounted to a real procession, and it was an unbroken succession of increases covering the period between then and the end of the war.

BOILER TUBES—	Seamless Per 100 feet	Lapweld Per 100 feet
1 inch	$32 00	$.....
1¼ inch	36 00	.....
1½ inch	39 00	32 00
1¾ inch	39 00	32 00
2 inch	45 00	32 00
2¼ inch	48 00	34 00
2½ inch	50 00	40 50
3 inch	58 00	45 00
3¼ inch	.....	52 00
3½ inch	70 00	54 00
4 inch	80 00	67 00

Lower Prices Named on Sheets

SHEETS, PLATES — Lower prices have been named in some quarters on both galvanized and black sheets, the former coming down about 80c and the latter from 50c to 80c per 100 pounds. Prices named herewith are, it is indicated right in line with quotations from the mills and that lower prices than these will develop is not probable unless mill figures are revised; this is not an immediate prospect. The tonnage coming to hand is good and jobbers generally are in a position to take care of all business offering. The demand just at the moment is not heavy but activity is looked for at an early date.

BLACK SHEETS—	Per 100 lbs.	
10 gauge	$6 00	$7 00
12 gauge	6 05	7 10
14 gauge	6 10	6 70
16 gauge	6 20	6 75
18-20 gauge	6 80	7 30
22-24 gauge	6 85	7 35
26 gauge	6 90	7 40
28 gauge	7 00	7 50
3-16 inch plate	....-	....- 7 40
¼ inch boiler plate	....-	....- 7 00
GALVANIZED SHEETS—		
10¾ oz.	$8 50	$9 05
U.S. 28	8 20	8 75
U.S. 26	7 90	8 35
22 and 24	7 75	8 30
18 and 20	7 60	8 15
16	7 45	8 00
12 and 14	7 35	7 90

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

Lead Pipe and Waste Holds; Solder Down

LEAD AND ZINC PRODUCTS—No further change has developed in lead and zinc products, although lead sheets are being quoted down to 11c per pound in some quarters. The market declines in lead will, it is felt, work out in a lowering of values in traps and bends though no revision is yet reported.

Lower price levels have again been reached in solder and the basis now prevailing is given as follows: guaranteed, 38 to 40c per pound; strictly, 34 to 37½c; commercial, 31 to 33¾c; wiping, 30 to 31c; wire, 45½c. Full range of prices is shown herewith:

Lead pipe, lb.	....	$0 13
Lead waste pipe, lb.	....	0 14
Lead traps and bends	....	Net list
Lead wool, lb.	..	0 14
Lead sheets, 4 to 6 lbs., sq. ft., in rolls, lb.	0 11	0 12½
Cut sheets ½ to ¾c lb. extra and cut sheets to size, 1c lb. extra.		
Solder, guaranteed, lb.	$0 38	$0 40
Solder, strictly, lb.	0 34	0 37½
Solder, commercial ,lb.	0 31	0 33¾
Solder, wiping, lb.	0 30	0 31
Solder, wire, lb.	....	0 45½
Zinc sheets, per lb	0 16	0 20

New List Old Materials Announced

OLD MATERIALS — As indicated in last issue of SANITARY ENGINEER, a new list of scrap metals and other lines was being worked out. This is now available and in it some very severe cuts have been made in the prices that dealers will pay. It is indicated that the list was not put out with the idea of stimulating trade, for an announcement that prices dealers will pay have been cut to pieces is hardly calculated to help matters this way. A leading Toronto dealer when asked if anything was coming in at the new low levels said, "There is practically no business going on at present. Many of the yards are going over their business for the year. As a matter of fact we do not want to buy, and sellers do not seem anxious to dispose of their holdings at present rates. I can't see where there is anything in the immediate future that is going to improve matters much either. For all practical purposes we are simply sitting on the fence at the present time."

Dealers' Buying Prices

Tea lead	0 03½
Heavy lead pipe	0 05
Yellow brass	0 08
Red brass	0 10
Light brass	0 06
Heavy zinc	0 05
Heavy copper	0 15
Stove plate, per ton	14 00

Ingot Metals At Lower Levels

INGOT METALS—A general revision in ingot metals is reported this week and dealers express the view that the bottom has been reached for some time to come. Stocks are in very fair shape, it is said, and future prices will follow the markets more closely. Copper, tin, spelter, lead and antimony have all been affected. Lower levels may develop in the coming months, but these are not an immediate prospect it would seem.

COPPER—Lower price levels have been reached on copper, quotations now ranging from 25c to 28c per pound. There is some interest being shown in this metal, though demand is not exceptional.

TIN—A decline in tin has been re-

(Continued on page 32)

Annual Meeting of Toronto Society

Reports of the Various Chairmen Submitted and Passed—Outlook Very Encouraging —Members' Attendance More Active—Dues Paid Up Well in Advance— Presentation to Corp. Harry E. Griffith, Now Returned From Overseas

THE reports of the chairmen of committees and officers for 1918 were received, as well as the newly appointed chairmen and committeemen being announced for 1919, and other important business that came before the meeting being acted upon..

President Frank R. Maxwell, of the Ontario Society, officiated as chairman for the meeting, in the absence of President-elect Thomas Ferguson, who was ill with an attack of the flu.

Corporal Harry E. Griffiths, one of the members who has been overseas, and who recently had been returned to Canada, was present, and received a cordial welcome among the members. Secretary Frankland, on behalf of the society, presented Corporal Griffiths with a fountain pen and a cabinet of reminders of "Over There" in the shape of "fags." In reply, Corporal Griffiths thanked the members of the society for their welcome, and assured everyone that he was glad to be back again, and hoped to be soon in harness and doing his bit at the old stand.

Chairman Fred A. Wiles, of the Educational Committee for 1919, outlined a proposal to hold an open meeting for the entire trade in Toronto, at which Mr. John Kirkwood, advertising counsel, would be secured to address the craft on "The Cost of Doing Business" or "Co-operative Advertising." Further particulars to be announced later, it being the idea to arrange for same at an early date, in conjunction with the different "Ender Clubs."

Messrs. F. R. Maxwell and Secretary Frankland reported on several conferences held with representatives of the Builders' Exchange and other organizations, in reference to affiliation with the Canadian Association of Building and Construction Industries; and it was approved that a special meeting be held to consider this and the report of Secretary Frankland as delegate to the Ottawa conference of the above.

The chairmen and members of the committees for 1919 were approved as follows:

Executive Committee

Vice-President Kenneth B. Allison, chairman; chairmen of committees, members of executive.

Finance Committee

President Thomas H. Ferguson, chairman; vice-president, treasurer and secretary, members.

Trustees Board

George McGuire, chairman; Messrs. George Clapperton, Frank R. Maxwell, Thomas B. Smyth, Harry G. Waterman and John Wright, members.

Advisory Board

Fred H. Gentle, chairman; chairmen of committees, members of Board.

Sanitary and Legislation

John Wright, chairman; Messrs. Norman Swanston and Fred A. Wiles, members.

Heating

Harry G. Waterman, chairman; Messrs. Wm. Mansell and Wm. G. F. Sheppard, members.

Arbitration

Alex. S. Purdy, chairman; Messrs. Harry G. Waterman and John Wright, members.

Apprenticeship

George Clapperton, chairman; Messrs. Thomas M. Maxwell, John Wright, Fred H. Gentle and Harry G. Waterman, members.

Educational

Fred A. Wiles, chairman; Messrs. William J. Hall and Harry A. Weinraub, members.

Entertainment

Harry A. Farthing, chairman; Messrs. George H. Cooper, John A. Lillie, members.

Membership

Kenneth B. Allison, chairman; chairmen of Ender Clubs, members.

Standardization

Lewis LeGrow, chairman; Wilfred E. Ramsey and George R. Baker, members.

Workmen's Compensation

Frank R. Maxwell, chairman; Harold J. Hillier and Albert H. Read, members.

President's Report, 1918

Gentlemen:—

As the recipient of the highest honor in your bestowal for the past year, I express my deepest gratitude, and trust that my effort was in keeping with your expectations of me.

I wish to express my hearty thanks to the officers and members for their constant support, and I have no hesitation in saying that the affairs of our society to-day are on the most solid basis in its history, due entirely to the unqualified and generous assistance at all times given in its interests, by the members of your executive committee, in addition to your valued support.

The agreement with our journeymen as entered into during the year is, I am sure, gratifying to all parties interested, and ought, in a great measure, to assist us to get over the coming period of restoration.

The future can only hold prosperity for our business, and while we have all come through the trying times of the past four years, each one of us should strive to be in a position of readiness for the resumption of work that has been deferred during the period of the war.

The enactment of Plumbing Regulations and Examination Boards has placed us in a most enviable position, and it behooves each one of us to safeguard our rights and interests in this particular regard.

Heating regulations are under way as essential to the safety of our property and to life, all of which must tend to make us a more important factor in the community of which we are a part.

I again thank you on my own behalf, and also on behalf of my assistant officers and executive, and regret my inability to be with you on this occasion through illness, but assure you that in the near future I will be available in whatever capacity I can serve you.

Yours truly,

A. S. PURDY,
President.

Secretary's Report

January 15th, 1919.

Mr. President, Officers and Members:

I appreciate, gentlemen, that another year has gone its round, and that now at the inception of 1919 we have passed another milestone in our society that can only be looked back upon with the deepest pleasure by us all, for not to mention the success our organization has enjoyed, we have the cessation of hostilities in the world war—that has been waging since August, 1914—to remember it by.

I cannot mention anything that gives me more pleasure than the fact that more than ever our members realize the necessity of "carrying on" in a proper business manner, and I look forward to the day, and from all signs it is not far distant, when all who engage in our business will operate from a proper place of business accessible to the public, and in that way become more efficient merchants and salesmen. So many are only mediums for the installation of goods that they have no part in the sale of, and therefore receive no profit on, the goods they instal.

That the opening of proper places of business will, in a great measure, overcome the many evils of our trade to-day is very apparent to me, and I hope and trust that this remedy will be effective in the general welfare of all.

I have given considerable thought to the financing of our organization, and the more I go over it, I am of the firm belief that we must have a more equitable method of assessing our members, so that the benefits of the society are proportioned according to the business done by the different members. I suggest a minimum annual fee, and addi-

tional assessments on wage roll, as shown in connection with the Workmen's Compensation assessment. By this method all would pay equally for the privileges secured through our society.

In the addition of Messrs. John D. Smith, Lou Palter, Charles C. Ormsby, John Matthews, and Wimpenny & Byrne to our ranks in 1918, we continue to build our institution along the lines of strength and right for all enaged in our craft and business.

I thank one and all for the hearty support rendered me during the year just closed, and bespeak for a continuance of same throughout 1919, and with best wishes for our continued success.

Yours very truly,
GARRETT F. FRANKLAND,
Secretary.

THE TORONTO SOCIETY OF DOMESTIC SANITARY AND HEATING ENGINEERS
Financial Statement from January 1st, 1918, to December 31st, 1918
TREASURER'S STATEMENT

Revenue		Disbursements	
Date, 1918		Office Rent	$ 180.00
Jan. 18—Cash from Secretary	$ 440.87	Hall Rent	30.00
Feb. 22—Cash from Secretary	240.00	Salary, Secretary	1,560.00
Mar. 25—Cash from Secretary	110.00	Telephone	52.00
May 31—Cash from Secretary	377.72	Office Expenses	128.09
July 11—Cash from Secretary	360.04	Printing	60.25
Sept. 7—Cash from Secretary	273.34	Treasurer's Honorarium	100.00
Oct. 4—Cash from Secretary	250.00	Ontario Society per cap.	200.00
Nov. 8—Cash from Secretary	20.00	Entertainment Committee	237.10
Dec. 6—Cash from Secretary	50.00	Builders' Exchange, Donat'n.	25.00
Bank Interest	16.94	Delegate to Ottawa	50.00
	$2,138.91	Overseas Boxes	30.00
Cash in Bank, Jan. 1st, 1918	609.41	Wreath, Jas. O'Neil, Inspec.	10.00
	$2,748.32		$2,662.44
		Cash in Bank, Dec. 31st, 1918	85.88
			$2,748.32

Audited and found correct,
A. H. READ,
M. R. H. DANIELS.

All of which is respectfully submitted,
THOMAS M. MAXWELL,
Treasurer.

Toronto, 7th January, 1919.

Auditors' Report

Gentlemen:—

As your auditors for 1918, we beg to say that we have examined all the books, cheques, vouchers, orders and receipts of the secretary and the treasurer, and find same correct in every particular.

We congratulate the members on the exceptional good showing of the financial affairs of the society, and note with extreme pleasure that all the members' dues for 1918 were paid early in the year.

The work of these two officers is also to be commended, and we compliment the society on the splendid manner in which their books and records have been kept.

Bank statement being—

Total receipts	$2,748.32
Total disbursements	2,662.44
Balance in bank	$ 85.88

All of which we respectfully submit for your approval.

A. H. READ, Auditor
W. R. H. DANIELS, Auditor.

Report of Chairman of Heating Committee

Dear Sirs:—

As chairman of your heating committee for the past year, I beg to make the following brief report:—

All questions pertaining to the heating business which have been brought to my attention during the past year have been properly taken care of, and I trust that in future our members will make more use of the heating committee for the benefit of what we might call the "Small Contractor," or new man starting in the heating business, of whom there are quite a number from year to year established when speculative building is good.

There are numbers of these men who spring into existence who are more or less detrimental to the contractor who is operating an established independent business. I mean by independent, a heating man who is capable of sizing up any kind of a heating problem for himself, and who has sufficient conviction in his own reasoning to act upon it without asking advice from a number of people, who know less about it than himself.

I hope that our society will, in the not distant future, see fit to establish an office where heating plans, suggestions and layouts may be approved by one who is competent to rectify errors and check up figures in such a manner that the little contractor will soon be enabled to take care of himself, as far as laying out and figuring a heating job goes, without having to ask the advice of parties whose sole object is to sell a bill of goods and to get the little contractor's price below every other price in sight—quite regardless of whether he gets sufficient to pay for the goods out of the contract price, without considering such items as labor, overhead expense and profit. I am of the firm opinion that to establish a clearing office of this nature would be to cement our membership together and so have an opportunity of educating them into making a profit.

These few remarks contain the foundation of my idea, and at this time of suggestion I will not burden you with many details, which might be discussed were these suggestions acted upon.

Yours sincerely
H. G. WATERMAN.

Educational Committee's Report

According to custom, I, as your chairman for 1918 of the Educational Committee, must give an account of my stewardship, and if there is a feeling going through you that nothing appears to have been done (which I am inclined to grant from your viewpoint) then you will forgive me if, in trying to defend myself, I in turn criticize you. I trust you will receive my words in the same spirit that I give them, viz., for the sole welfare of every fellow-member.

As a result of our memorable trip to Buffalo early last year I prepared a paper in which I tried to bring back helpful suggestions to this society. Among these I suggested that in place of our secretary being the mouthpiece for each and every one of us, that the chairmen of the several committees should be present at all general meetings and personally report on all matters which pertained to the committee of which they were chairmen. It was not acted upon in 1918, but I know that this matter has now been brought to a head and will be in future so acted upon. I also suggested a Booster Box as the means of aiding members to dispose of stock, which was slow moving on their hands, and also to purchase from other members stock which conditions might make it hard to otherwise obtain. This matter likewise you have neglected to act upon. Am I to assume that your indifference to it signifies your complacency with things as they are, or your dubious feeling as to the practicability of the suggestions?

The re-sale price book, which I circulated, proved of benefit to those who saw fit to use it, and I wish to go on record here as appreciating very gratefully the active assistance which these members rendered me, and to assure them that I fully believe that I may in the very near future be able to present the results of other actions, which I have taken entirely because of that same active assistance.

A large advertising proposition for "Bigger Business" also occupied a lot of my spare time—Mr. Belyea working with me. I prepared considerable ad. copy and corresponded not a little with our fellow craftsmen across the line, but finally war conditions and the necessity of conservation prompted us to withhold this scheme to a more favorable time. Regardless of the details of the policy, publicity has to come if we are to raise our business to the higher status to which it rightfully belongs.

We also held two meeting nights wherein some added feature was thought to have been a good inducement to get the lagging member out, but I am sorry to say that we did not receive the support in attendance that our work justified. The influenza epidemic also rendered void what I believe would have been our most helpful meeting in 1918, and we therefore had to forego until later an address by Mr. Kirkwood on Advertising. If I might humbly make a suggestion for the future work, might I say that, from a business standpoint, more than a mechanical one, we should use our best efforts to raise the status of the trade to a profession by continually advocating all things that tend to

betterment as the proposition of a merchant. You know that whether we are looking for a job or just selling peanuts, we are in the same class—salesmen, and if more of our efforts were turned to scientific salesmanship we would the more readily grasp financial costs, overhead, and profit. Many members of our profession appear to think that to be a practical mechanic and be well up in matters theoretical, is the essential part of the business. But I fail to see how one can carry on a business, unless he knows how to conduct his business in such a way as to make a sufficient margin, which will enable him to pay his just debts and put a little away for a rainy day every day. Surely the laborer is worthy of his hire. Then he should be as practical in business management as he is in mechanical work. Neither departments can succeed alone.

Yours respectively,

KENNETH B. ALLISON,
Chairman.

Entertainment Committee Report

Gentlemen:—

During 1918 we enjoyed the hospitality of our Buffalo cousins, and later were favored with the honor of their visit to us, at the time of our Exhibition. That the elements were unfavorable during their visit was most unfortunate, but we look forward to another opportunity of bestowing our good cheer, with less moisture, upon them on the days we choose for the event.

Several features were arranged for our monthly meetings during the year, and we trust to have more of these in 1919, when we hope more of the members will avail themselves of the opportunity of attendance.

Thanking you for the confidence you have again shown in once more electing me to your executive committee, and trusting that my endeavors in the coming year will warrant your action, I am,

Yours to command,

HARRY A. FARTHING,
Chairman

Committee Report on Workmen's Compensation

Mr. President, and Fellow Members:

I will give you a few of the recent items that have received your committee's attention in connection with the Workmen's Compensation Act.

The new system of Merit and De-merit marking in connection with the Act is now in operation, as, no doubt, some of you have learned, through the Board forwarding to you a refund if you were in the Merit class, or a request for additional assessment if you were unlucky enough to be in the De-merit class. While the Merit side of this system is very satisfactory, I do not approve of the De-merit side, as I believe it is not fair to penalize any one for an accident that is out of his control, besides the unfair feature of extra assessment, which you will find it impossible to secure from your clients, thus being a hardship on the contractor.

The method of arriving at this extra assessment and refund is most complex. and needs to be figured out carefully so that you can understand it. A copy of the pamphlet as issued by the Board will explain the matter thoroughly. Myself and Mr. Read attended with delegation from the Builders' Exchange on the Premier, in protest of the requests made by the Labor deputation, that the Act be amended as follows. Our requests were promised the careful consideration of the Cabinet.

Clause Five was the only item that we approved, all the others were considered of too drastic a nature for enactment.

1. That the present rate of 55 per cent. of the workmen's former wages was inadequate to meet the liabilities.

2. That the entire cost of all accidents should be borne by the various industries covered by the act, and that injured workmen should receive compensation to the full extent of their former wages.

3. As a lot of time is lost owing to weather conditions, the men should be compensated on the basis of union, or the prevailing rate of wages paid in the cities or towns.

That the medical provision of the Act, which at present only covers the first month of disability, should cover the whole period.

5. That the scope of the Act should be broadened to include private companies not engaged in the building trade.

6. That widows should receive at least $30 a month for themselves and $10 for each child under 16, instead of $20 a month and $5 for each child, up to a maximum of $40, as at present.

Assuring you of our further attention to your affairs in this regard, I remain,

Yours truly,

F. R. MAXWELL,
Chairman.

Lower Prices on Boilers and Radiators May Come

THE announcement made by the American Radiator Co. on January 1, that new prices approximating a decline of 25 per cent. in boilers and radiators had been made has caused considerable comment in Canadian trade circles as to what action, if any, was contemplated by the manufacturers of similar lines here.

That lower prices will be reached seems probable but just how much the decline will be is still somewhat uncertain, probably in the neighborhood of 10 to 15 per cent. on boilers with a smaller amount on radiators. Comparison of prices prior to the issuance of this latest price in the United States markets favored the Canadian manufacturers. The object of this article then is to show the present disparity between the two and outline facts which may be expected to bring about a lowering of values on this market.

Starting with round water boilers there is no great difference in prices to the small buyer. American sheet prices on No. 4 round water boiler show a cost to this class of buyer of $128.80, which with a 35 per cent. duty would bring the laid-down cost to about $173.88. The present Canadian price is $171.00, a slightly lower figure.

However, when one comes to the usual export price to the larger buyers there is a different story to tell. With the extra discount allowed on this business there is a net difference of 10 to 20 per cent. between the United States and Canadian prices, the former being that much lower. The No. 7 boiler, however, does not show this difference, in fact, practically no difference at all. Usual prices to the larger buyers on these show a cost when imported from the United States of about $299.38 laid-down, whereas the Canadian price figures out at $303.24, so no reduction on these need be made. A factor in making comparisons that must be borne in mind is the one that Canadian boilers have to be supplied with branch headers, whereas imported boilers do not have these, so considering this point, the difference in price is not so marked. Figures show that probably 75 per cent. of round water boilers sold are Nos. 3, 4, 5 and 6, and on these it seems probable that a further discount of around 10 per cent. in Canadian prices may be allowed.

In round steam boilers, however, there is a greater difference in figures prevailing to-day. Owing to the Government regulations which apply in the various provinces it is difficult to make comparisons. American boilers are quoted without safety valves, whereas in Ontario special approved steam trimmings are necessary and a Government fee for registration is charged. In addition to special trimmings and registration, in Alberta it is necessary to have special brass plugs for clean-out purposes installed which means additional expense. However, considering all these factors, it seems that some very material reduction may be looked for amounting to anywhere from 10 to 15 per cent.

On the square type water boilers the larger type show somewhat greater difference than the smaller. However, it would appear that present figures may be revised to the medium and large buyer providing for a decline of from 10 to 15 per cent.

The difference in square type steam boilers seems to be much greater than that on square type water, but here again con-

PRACTICAL SHEET-METAL WORK

THREE PIECE ELBOW WITH GUSSET OR GORE PIECE.

BY THOMAS STANSFIELD

IN this issue is shown a flaring article round in plan at top and bottom, but with one side in elevation square with ends, as shown by A-C-D in elevation.

The first step is to draw plan with two circles, divide both circles in plan into the same number of equal parts as shown by 1-2-3-4, etc., and A-B-C-D, etc., in dividing the two circles start at the end of diameter on inner circle which is parallel diameter on outer circle. Then draw lines, joining these divisions as shown by 1-A-2-B-3-C-4-D-5-E, etc., and with these distances as bases and with straight height of elevation at A-C as an altitude form the angles shown at L-M-N-O.

The pattern could not be laid off with angles derived from lines as above described, as it is necessary to form another set of angles; the base lines of these are drawn so as to join the ends of two adjoining lines drawn from division points, as shown by dotted lines joining 9-H, 8-G, 7-E, 6-E, 5-D, 4-C, 3-B, and 2-A.

With these lines as bases and same altitude as described above, from angles as shown at R-S-T-V and X. To lay out pattern 1-A, making it equal to A-C on elevation, this gives us points 1 and A shown on plan.

To obtain the next point on either top or bottom of pattern it is necessary to work from 1 to B as a base on plan or from A to 2, as shown in the connecting or dotted line from A to 2.

Now take distance R-2 and angle formed with A-2 as a base line, and with point A in pattern as a centre, draw an arc near point 1, with one division of plan of base as a radius, as 1-2; then draw an arc from point 1 on pattern intersecting one drawn from A, thus obtaining point 2; this gives us points 1 and 2, and A. To obtain the next point B, take distance L-B formed with base line 2-B, and using last obtained point 2 as a centre and draw an arc near point A intersecting it with one drawn from A, having a radius equal to one division of plan of top, as A-B; lay out all the remaining angles working as described form B to 3 on dotted line, B to C on solid line, C to 4 on dotted line, 4 to D on solid line until the line 9-K or one-half the pattern is set off, when a line drawn through the points obtained will give outline of one-half pattern, which can be used to mark off balance, or the above can be laid on opposite side of line A-1 as shown as suits one's purpose.

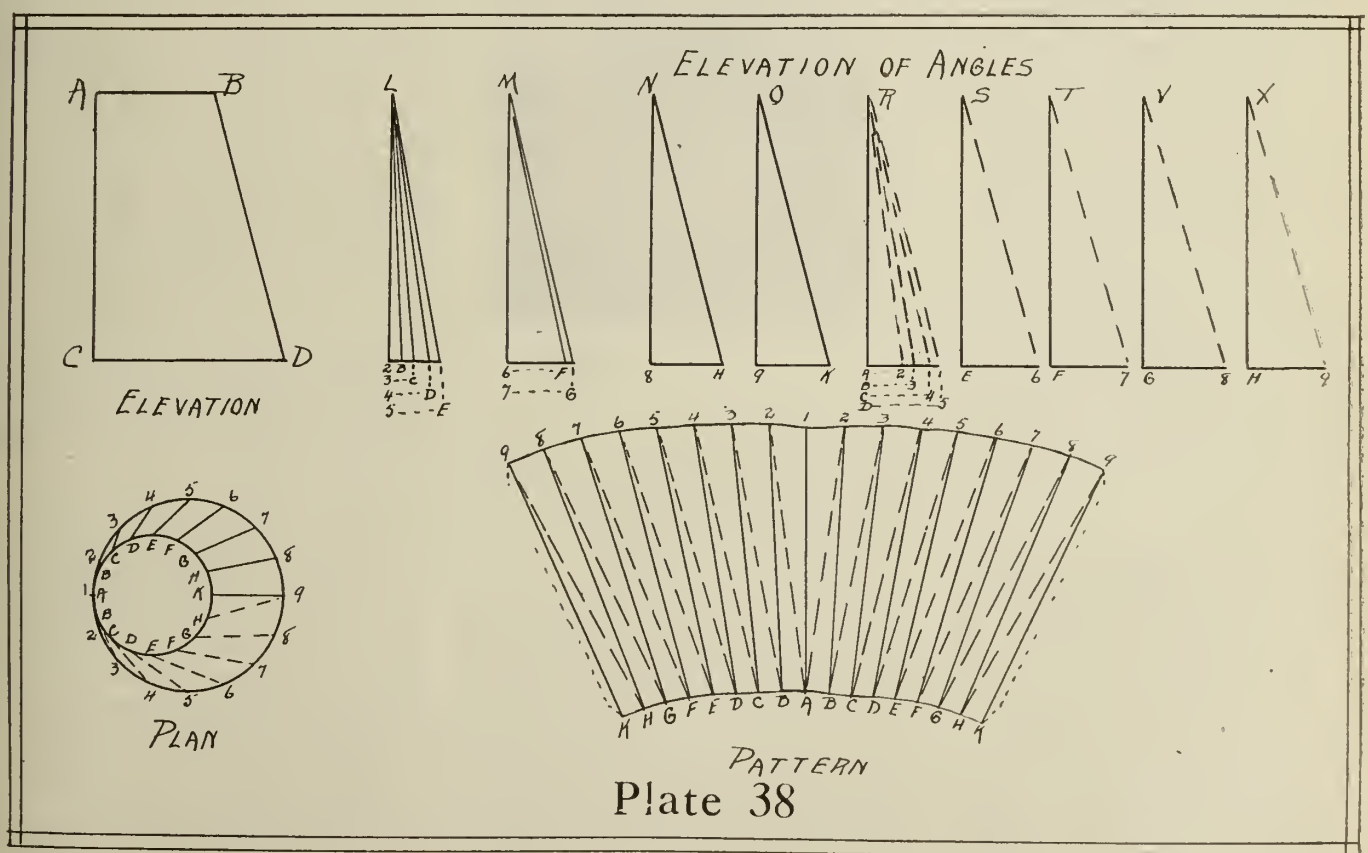

Plate 38

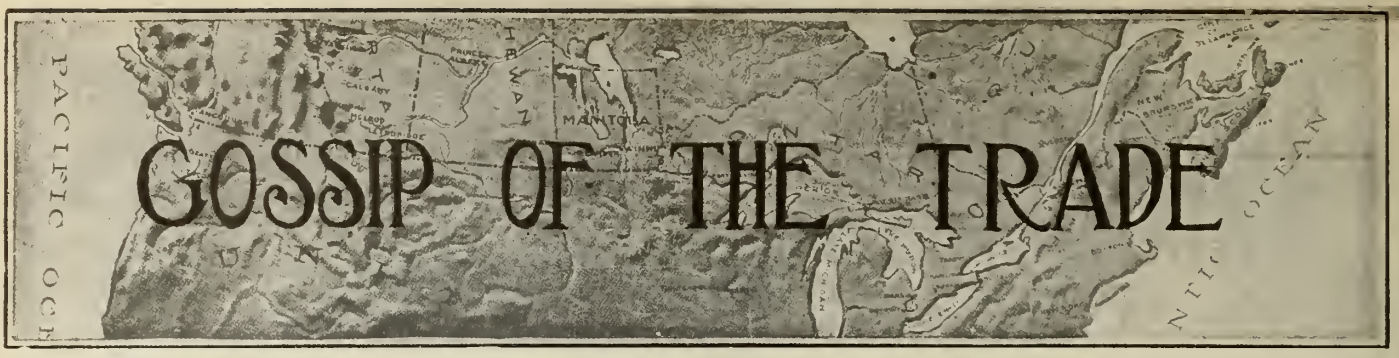

GOSSIP OF THE TRADE

CALLED AT OUR LONDON OFFICE

We had a letter from our London, England, office, stating that a reader and subscriber to SANITARY ENGINEER from Canada, in the person of Clarence E. Paddon, son of Robert Paddon, of Windsor, Ontario, paid a visit there. We are informed that our friend "Clarence" is recovering nicely from a wound in the knee. He was a victim of the Hun when on active service and has been an invalid for several months in one of the hospitals over there, but expects to be on his way back soon to the land of the maple leaf.

TORONTO SANITARY ENGINEER ESTABLISHES HARDWARE BUSINESS

Many of the Toronto friends of Lou Palter will be pleased to learn that he has made another important move—not only in location but also in expanding his business. Mr. Palter began business some five years ago on College Street West and did a nice plumbing and heating business, conducting, too, a very attractive show room, and making his store windows help him in an advertising way.

His new location is 668 Bloor Street West, and he has added to his business by including a hardware and stove department, thus becoming more of a merchant than in the earlier stage of his business career. Mr. Palter believes that the first step towards making a success in any business is to become a salesman and the next is to know the goods one sells. We believe he will make further progress as time goes on, and would hail with delight the time when every member of the craft would begin to realize that the biggest drawback in the sanitary and heating profession is lack of salesmanship. What is the use of acquiring knowledge if one does not know how to sell that knowledge?

RETURNED FROM OVERSEAS

The many friends of the trade in Toronto will be pleased to learn that Major G. Allan Keith, of Keiths, Limited, has now returned from overseas, where he has been doing his bit to make things hot for autocracy and the Hun. He hopes soon to be on active service in a more peaceful occupation in the heating business in Toronto.

Another member, too, is back on the job in the person of Corp. H. E. Griffith. Mr. Griffith established a plumbing and heating business some years ago on College street and shut up shop to go overseas. We are all pleased to hear that he, too, hopes to be back among boilers and radiators, etc., very soon.

A LETTER FROM GERMANY

The editor received a very interesting letter the other day from Staff-Sergt. Harry Ruddick, of Toronto. He enclosed a Christmas card, and explains the reason why it is late in arriving. Some of his Toronto friends in particular will be pleased to hear from Harry, and

Staff Sgt. H. Ruddick, M.G.C., recently Decorated with a D.C.M.

as he wishes to be remembered to some of them the editor thought it would not be out of place to publish the letter in full, which reads as follows:

Staff.-Sergt. H. Ruddick, 843,
1st Btn. Can. M. G. Corps,
B. E. F., Germany

Dear Friend,

I am afraid that the enclosed card will be a little late for its purpose. They were printed in England, and, owing to delay in the mail they did not arrive until a couple of days ago. Please accept it as a small souvenir from our unit, who are now part of the army of occupation in Germany. The people of Belgium treated us very well during our march through their country towards the frontier. They had heard of the great doings of the Canadians during the war and in many different ways they showed their appreciation of our services. After crossing the frontier into Germany our reception was rather mixed. The majority of the German people seemed to be friendly enough, but some would have caused trouble if they dared. We are now billeted in a small town across the Rhine, about eight miles up the river from Cologne. When outdoors all ranks are armed, either with bayonets or loaded revolvers. Civilians have to strictly comply with our army regulations and have to be indoors at 7 p.m. We have no idea how long we may be kept here but you can guess that our one thought is to get back to dear old Canada again. I certainly did not think when joining up that I should be four years away from home. We are cheered in knowing that our object has been attained and that our great sacrifices have not been in vain. How are things in the sanitary and heating business? I expect to see things booming again in Canada in the near future. Sanitary engineers are and will be much needed in France and Belgium, but I would rather do my bit in that line in Canada. Mrs. Ruddick tells me that you ring her up on the phone once in a while. It is very cheering to her that friends keep in touch, if only by phone. I am sending a bunch of cards off, so please excuse short note. Kindly remember me to any of the old boys whom you may run across.

Your sincere friend,
HARRY RUDDICK.

AS WE GO TO PRESS

It will interest the many friends of Staff-Sergt. Harry Ruddick, Toronto, that he has been awarded the Distinguished Conduct Medal since the above letter was written.

NEW APPOINTMENTS MADE

The C. A. Dunham Co., Ltd., Toronto, announce that a change has been made in their branch sales office at Montreal. Mr. A. Kastello, recently superintendent of construction for the Imperial Munitions Board at Trenton, but formerly with the Dominion Government and Grand Trunk Railway, has been appointed new branch manager in charge of their office at 711 New Birks Building.

Mr. Kastello is to be assisted in the company's growing business by Mr. F. O. Hamel as heating engineer, formerly first assistant engineer in the Public

Works Department, Dominion Government at Ottawa.

The C. A. Dunham Co., Ltd., are very optimistic over the prospects of building activity, and this change has been made to strengthen their organization and to render better service to their trade and clients in Montreal.

JUST PASSED ON

With the "passing on" of Matthew Barr, one of the late partners of Messrs. Barr & Anderson, Vancouver has lost a good citizen and splendid business man. This concern employed quite a number of men, and Mr. Barr was well liked by all who knew him. The firm occupies very fine premises at 1060 Homer Street, Vancouver, B.C. Many of the buildings show the marks of the skill and ability of our late fellow craftsman.

DOWN WITH "FLU"

The friends of Roy E. Belyea, of Belyea Bros., Toronto, will regret to learn that he is confined to his home with a severe attack of the "flu." Mr. Belyea is one of the coming men in the sanitary and heating engineering field. He is building up a splendid business, and both he and his brother are very active workers in the Toronto Society of Domestic Sanitary and Heating Engineers. One of Roy Belyea's chief ideas about conducting a business is that the public are always right. He believes in publicity and has devoted no small amount of time to the society above mentioned in trying to work out an advertising publicity campaign.

A TRIBUTE

Francis J. Torrance, Foremost Figure in the Sanitary Industry of This Continent

It can probably be said of Francis J. Torrance, first vice-president and chairman of the executive committee of the Standard Sanitary Manufacturing Company, who passed away at his home in Pittsburgh, on Wednesday, Jan. 8th, 1919, that he, with the late James W. Arrott, was the father of the sanitary cast iron enamel ware industry of this country, if not of the world.

Not alone in the plumbing fraternity everywhere, but the jobber of plumbing supplies and the manufacturers of various utilities used in modern plumbing, such as gas pipe, soil pipe, range boilers, water heaters, brass goods, valves, closets, etc., may well pay tribute to this man. They owe a large measure of their successful development to him and to the industry in which he was such a dominant factor.

Francis J. Torrance was the first manufacturer to apply what is known as the "Dry Process" in the enameling of cast iron sanitary goods. Prior to the time of his advent into the industry, what is known as the "Wet Process" had been used in the application of the enamel to the metal. When he embarked in the business with his father and the late James W. Arrott, their plant turned out possibly three or four bath tubs per day, and even these were not perfect. Mr. Torrance lived to well realize his ideal, for the interests which he helped so greatly to promote now produce over 1,000 bath tubs per day and their proportionate amount of small ware.

When Mr. Torrance embarked in the industry, bath tubs were few and far between, not one house in hundreds contained plumbing. The public, the architect and the plumber had no confidence in cast iron enameled ware, because up to that time such ware as had been produced was of so inferior a quality that it could gain little foothold in public confidence.

The late Francis J. Torrance.

Mr. Torrance, with his associates, brought, from comparative obscurity, the manufacture of cast iron sanitary goods into the high light of a great industry. He was an advocate of sanitation in the fullest sense of the word. He, with his associates, is responsible, possibly more than any other one man, for the great spread of modern plumbing, the modern bathroom and the conveniences and comforts which sanitary plumbing means to the people. He adapted modern means and methods to the manufacture of bath tubs and bathroom appliances. He devised new patterns and improved upon the old. He cheapened the processes of manufacture. He was a great beliver in publicity, and by his sagacity, his shrewdness and his foresighteness, he with his associates developed an industry which grew from a few thousands of dollars a year to over twenty-five millions, with offices and showrooms all over the globe.

He became a missionary in the cause of sanitation. He not only undertook the arduous duty of overseeing the manufacture of the product, but he set out to call on the plumber, the jobber and the architect as well, to preach the gospel of better plumbing and incidentally to sell his goods. He opened up the forest of prejudice, and by his energy, his insistence, his affability and his confidence in his objectives, he paved the way for the development of modern sanitation, such as we enjoy to-day. One might easily say that to follow the history of sanitation on this continent in the last thirty years is to follow the history of the growth of Mr. Torrance's company.

The death of Francis J. Torrance removes a gentle, courteous, whole-souled figure; a man of charity, high minded, unselfish, devoted to noble ideals. He was generous to the needy, beloved in his family relations, considerate and kind to all. Peace and honor to his memory.

LETTERS TO THE EDITOR

Toronto, Jan. 25th, 1919.

THE SANITARY ENGINEER,
Toronto, Ontario.

Dear Mr. Editor:—

I pen you these few lines with the utmost joy on my part for I have been exceedingly gladdened of late, in perusing the columns of your worthy journal, to notice the activity that seems to have arisen in Association circles of our craft.

That the duration of the war must have had a depressing effect on those engaged in our calling must be conceded, because the general building programme of the country was greatly curtailed. But, now when there seem to be prospects ahead for a resumption of building and reconstruction activities along all lines throughout our Dominion, I cannot but express the feeling of hope that is within me for a bigger and better Association of those connected with the most important phases of our every-day life, viz., Light, Air and Heat.

That the coming convention in Montreal of the Canadian Society of Domestic Sanitary and Heating Engineers, to be held in June, will bring together those in the calling from all parts of Canada, is my great hope, and if the members of the craft will only avail themselves of the opportunities that now lie before them by becoming active in their organization and combining their strength, great, indeed, will be the improvement of the conditions that surround them in their business.

I trust to see further news of association affairs in your paper, and hope that some good word will be received from those throughout the Western portion of Canada, as well as from our Maritime Provinces, who always were active in former days.

Thanking you for the constant guardianship that you have ever given to the affairs of our craft, and trusting that you may long continue to be editor and guide to the most essential vocation in the world, I remain,

A CONSTANT READER.

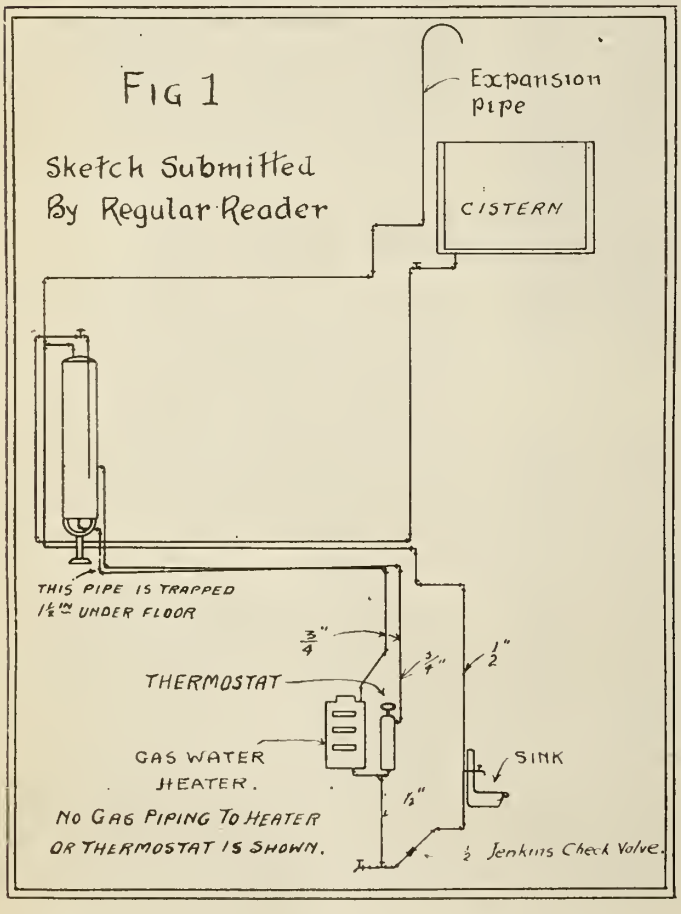
WHERE IS THE TROUBLE?

Editor SANITARY ENGINEER:

Enclosed please find sketch of an unsatisfactory job. Will you show me the changes I will have to make to ensure a proper working installation at least possible cost? If no check valve is used, is there a chance of drawing cold water at the sink? How high does the expansion pipe have to be over tank? When same was just over top, hot water ran intermittently. At present hot water rises in thermo, thereby shutting off the gas. This was an old job in the first place and heater had to be placed as shown.

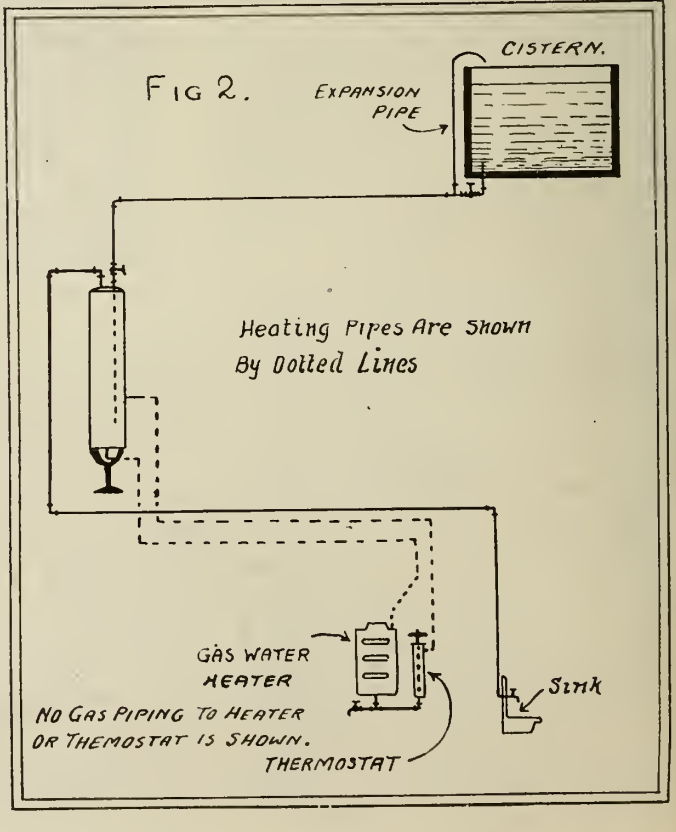
A Regular Reader, N.H.B.G.

In the first place, the cold supply to the range boiler should be connected direct to the top of the boiler, see Fig. 2. The piping under the floor must not be trapped, but rather should be pitched slightly upward.



The expansion pipe can be carried up as high as desired, but it can be taken off at the cistern as shown in Fig. 2. Regarding the trouble with the thermo closing off. This is brought about by having the hot supply pipe connected in circuit with the thermo and the heating pipe which enters the side of the boiler.

This is what happens. When the bibb at the sink is opened and water drawn therefrom the water flows just for a moment towards the check valve and is there only partially stopped, because it will be seen that as the bibb opens the columns of water on each side of the check valve are nearly equalized. There is no need for this pipe at all which is connected from bottom of heater and thermo to the bibb at sink. If this is taken out, an improvement will be noted at once. It should always be borne in mind that no circulating pipe or indirect connections should be made when a thermostat is to be used as shown on this or similar installations.——Editor.



MUELLER

Compression Sink Bibbs

SIMPLE elegance, combined with superior strength and wearing quality, is what you give your customer when you install **MUELLER** goods.

The many advantageous features of **MUELLER** compression bibbs give maximum service from the bibb as a whole. The anti-spreading device that breaks up the whirling motion of the water and the corrugated stem and handle, allowing the handle to be set at any angle without becoming loose or wobbly, are only two of these features.

MUELLER Bibbs are the best the market affords. Write for prices.

LOWER PRICES ON BOILERS

Continued from page 26

sideration must be given to the same conditions re Government equipment and registration as those noted in connection with the round steam boilers. This would seem to indicate that a net difference of 10 to 15 per cent. exists which Canadian manufacturers will undoubtedly adjust.

Radiators do not show such a big difference even on to-day's basis. The 2 col. steam, 38-inch, from the United States will cost the small dealer delivered in Canada $50.34, while the Canadian price is $50.85. The 3 col. water, 38-inch, from the United States to the small dealer figures out at $49.66 here, while the Canadian price is $52.80. To the carload buyer, 2 col. steam, 38-inch, will cost laid-down $45.97 from the United States, whereas comparative Canadian figure is $48.31. A 7½ per cent. reduction would not be out of line here. With the 3 col. water, 38-inch, carload buyers secure a laid-down cost from United States manufacturers of $45.38—this compares with a Canadian price of $50.16, so a 10 per cent. reduction would be quite in order.

There seems little doubt that Canadian manufacturers will bear these facts in mind and an announcement at an early date that lower levels have been reached seems a pretty safe hazard. An interesting point in connection with new prices named in the United States is that manufacturers there are guaranteeing their prices against decline. This would seem to indicate that they felt that the bottom had been reached for some time and that they are trying to exert a steadying influence on the building trade to encourage building operations. Whether Canadian manufacturers will adopt a similar selling policy along with any price revisions they may make is difficult to say, but it would not come as any surprise. Feeling that every encouragement to the building trade to start operations in a big way should be given may mean that prices will be guaranteed against decline.

A sweeping reduction of 25 per cent. in Canadian prices cannot be made and is not necessary to conform to American quotations. There are some lines which undoubtedly will come down, whereas others again may be expected to maintain their present levels. Canadian prices prior to the recent drop in the United States were well below the American figures and may be expected to be adjusted to necessary lower levels now.

At the present time the tariff issue is a live one and should the tariff be altered it may mean some further readjustments. However, it is thought that in the meantime manufacturers will work along present basis and meet new conditions which may arise, as they develop.

MARKET REPORTS

(Continued from page 23)

corded of about 2c per pound and the market is quite firm at present basis. Stocks are down to a very fair basis and fluctuations of market at primary points may influence prices here to a greater extent than they have done in the past few weeks. Quotations to-day range from 68c to 72½c per pound.

SPELTER—A slight revision downward is noted in this metal this week. Quotations generally prevailing are at a basis of 9c per pound and a fair amount of business is reported at this figure.

LEAD—The easier feeling in lead has developed into a decline in prices, but on the present basis the market seems to have touched bottom for a while at least. Quotations to-day range from 6¾c to 7c per pound; supplies are ample.

ALUMINUM—There have been no new developments here. The price in the United States is set to March 1, and little variation from present price of 50c per pound here is looked for prior to that date.

ANTIMONY—The price has sagged to 8½c per pound on antimony and conditions seem much steadier. Business is within a narrow compass at present, but a little better feeling seems to prevail as to the outlook.

PIG IRON—No startling changes are reported. A steadier feeling seems to have materialized and the trade is proceeding with the work in hand. The ocean freight rate situation is being watched carefully by United States interests in anticipation of further reductions which will enable the producers to offer their goods in markets abroad at prices which will compare more favorably with British market values.

ELECTED COUNCILLOR FIRST TRY

Thomas William Slean went to reside in Oakville, Ontario, from Toronto about eight years ago. He was born in New York City of Irish parentage, but the family came over to the land of the Union Jack when T. W. was about two weeks old. He learned the plumbing trade, and now carries on an extensive business in Oakville, and is still engaged in that line. He had the satisfaction of being placed at the head of the poll in his first municipal contest.

"VALVENE" Discs (REGISTERED)

Specially prepared for Hot and Cold Water Taps. All sizes from ½ inch to 1½ inches. Soft, Pliable, and "Joint-Perfect."

This is a "Q" Foot Valve

And it Just *CAN'T* Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

GET IN THE BIG MONEY CLASS NOW

SANITARY HEATING AND VENTILATING ENGINEERING

SANITARY Heating and Ventilating Engineering offers wonderful opportunities for advancement and money making right now. Modern methods and appliances are fast replacing the old ones, and the men who are up-to-date — the trained men — the men who know — are going to reap the benefit.

Get your share of the big money now. Here is the first thing for you to do — tear the coupon off this page and mail it to us today. It won't obligate you in any way and you don't have to send a penny, but it will bring you these four big volumes — just off the press — packed full of the very things you need to train yourself — all worked out for you in clear, understandable English by eighteen of the most successful men in these professions today.

No matter what your job is or how much you earn, you need these books — and you need them now. If you are in business for yourself, they will make your business bigger and better — the volume on business management, estimating and contracts and specifications alone will do it.

4 big volumes, size 5½ x 8¼ ins., bound in flexible American Morocco and trimmed in gold: 1454 pages: over 1100 pictures, diagrams and plates.

Here's what the Books Contain Thousands of problems under the following headlines are all worked out and made as simple as A-B-C.

Sanitary Science and Materials.
Water Supply. Hydraulics.
Sewers and Drains.
Drainage and Venting.
Sanitary Appliances.
Sewage Disposal.
Bacteriology and Sanitation.
Infectious Diseases.
Steam and Hot Water Fitting.
Domestic Hot Water Supply.
Heating and Ventilating Engineering.
Sheet Metal Work.
Business Management.
Estimating.
Contracts. Specifications.
Mechanical Drawing.
General Index and Review Questions and Index to Each Volume.

Free Consulting Service With these books goes free a year's consulting service in the American Technical Society, worth $12.00. This enables you to consult our engineers and experts for one year without charge. Ask as many questions within the scope of the book as you want for one year.

SHIPPED FREE

Examine the books and see for yourself just how valuable they are, but don't send us any money. The little coupon is all you need. Fill out all three lines and mail it NOW. It will bring you the whole set of books by express collect, and you can keep them seven days to use as you please—study them at home—take them to your shop—try to find some problem they won't answer, and ship them back at our expense if you think you can get along without them. If you want to keep the books after seven days' use, send us only $2.00. The balance can be sent in monthly payments of $2.00 each until the special introductory price of $13.80 is paid.

It will take years of hit-or-miss experience to gain what these books will give you in a short time; so don't pass up this opportunity—ACT NOW. We may never be able to offer this low price and these special terms again—only 7c a day. Tear off coupon before you lay this down and mail *today*.

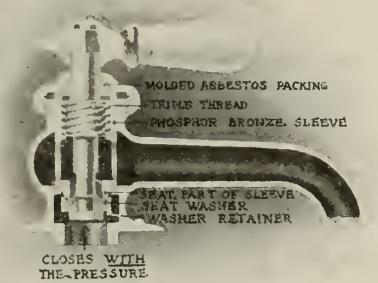
"Quaturn" is the Faucet



Exclusive Features
(Patented)

Your customers want them.

Why? Because one-eighth of a turn of the handle gives a full flow of water. Busy people haven't the time to turn a handle three or four times, as in the old Compression Work. Quaturn is the up-to-date and modern method.

And besides, while it opens and closes with ease, the action is positive and it stays wide open or tightly shut.

You will want to know more about the Quaturn. We have a letter ready for you. Write or telephone our nearest office for it.

The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH

Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with wood handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

Nut with Nut-Guards

HIGH CLASS

Steam and Water Fittings

Typical Way of Drilling Wall Holes
The average efficiency with this tool over hand drilling is 5 to 1 in both quantity and quality of work.

PHILLIPS SPRING HAMMER

THE FIRST AND ORIGINAL HIGH SPEED HAND DRILLING MACHINE

These tools are very simple in construction, and built to stand up to the wear and tear and hard knocks incident to every-day drilling of concrete. Can be quickly taken apart and put together by any workman, in field or shop, without possible error in reassembling. The machine is used with breast plate and two cranks for wall drilling and with two cranks and extension for drilling in ceilings and through floors. If desired it can be used with one crank, either right or left handed.

BORDEN CANADIAN COMPANY

110 Church Street - TORONTO

Typical way of Drilling Holes-Overhead in Concvete Ceilings & Trhrough Floors. Saves time and money. Every hole a finished hole.

No. 1 B. & C. Automatic Radiator Air Valve

Made from the best brass with cast brass base. Screwed and soldered on, and equipped with high grade carbon. All valves tested before shipping. Use these together with our famous "B & C" Floor and Ceiling Plates and insure satisfaction.

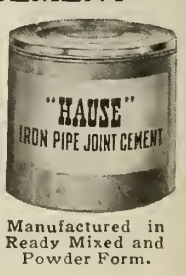
"HAUSE" PIPE JOINT CEMENT

For steam, water, air, oil, gas, gaskets, etc. The cement that cements. Sets like gum. Allows no leaks.

The Great Value of "HAUSE PIPE JOINT CEMENT" lies in its peculiar chemical properties which permits of its hardening and expanding after the joints are made up. In making up joints it has the same effect as a lubricant on the best graphite, and while the joints may be made and broken readily, a perfectly tight joint is maintained at all times. Comes in 1-lb., 5-lb., 15-lb., 25-lb., 50-lb. cans, 100-lb. barrels. Manufactured in ready mixed and powder form. Ask your jobber for prices, or write us direct.



Manufactured in Ready Mixed and Powder Form.

Made in Omaha, Neb., U.S.A.,

Why "Dart" Unions Save *Time and Trouble*

FACE AND SEAT ARE BRONZE

IRON PARTS ARE HEAVY

CONNECTION EASILY MADE

This means that there can be no rust or corrosion—no deterioration to cause loosening up and leaks.

They eliminate all possibility of stretching or pulling apart under unusual strain or heavy pressure.

Threads are exact to standard—and the ball-shaped seat allows easy connecting of pipes either in or out of alignment, so long as the nut can be started on its thread.

DART

Trade Mark

REPEAT ORDERS INVARIABLY FOLLOW WHEN A JOB GIVES A CUSTOMER COMPLETE SATISFACTION.

Use Dart Unions—they make a joint that stays tight **permanently.** Your customers will never be bother with leaks.

Make sure your next Jobbers' order includes Dart Unions.

Becoming a Bigger Man

WHAT is the difference between some men you know and others known to you? Why are some men earning $3,000 a year and some $30,000? You can't put it down to heredity or better early opportunities, or even better education. What, then, is the explanation of the stagnation of some men and the elevation and progress of others?

We are reminded of a story. A railroad man, born in Canada, was revisiting his home town on the St. Lawrence River. He wandered up to a group of old-timers who sat in the sun basking in blissful idleness. "Charlie," said one of the old men, "they tell me you are getting $20,000 a year," "Something like that," said Charlie. "Well, all I've got to say, Charlie, is that you're not worth it."

A salary of $20,000 a year to these do-nothing men was incredible. Not one of the group had ever made as much as $2,000 a year, and each man in the company felt that he was a mighty good man.

Charlie had left the old home town when he was a lad. He had got into the mill of bigger things. He developed to be a good man, a better man, the best man for certain work. His specialized education, joined to his own energy and labor sent him up, up, up. To put it in another way: Charlie had always more to sell, and the world wanted his merchandise—brain, skill and ability. Having more to sell all the time, he got more pay all the time.

Charlie could have stayed in the old home town; could have stagnated like others; could have been content with common wages. In short, Charlie could have stayed with the common crowd at the foot of the ladder. But Charlie improved himself and pushed himself, and this type of man the Goddess of Fortune likes to take by the hand and lead onward and upward. Almost any man can climb higher if he really wants to try. None but himself will hold him back. As a matter of fact, the world applauds and helps those who try to climb the ladder that reaches towards the stars.

The bank manager in an obscure branch in a village can get out of that bank surely and swiftly, if he makes it clear to his superiors that he is ready for larger service and a larger sphere. The humble retailer can burst the walls of his small store, just as Timothy Eaton did, if he gets the right idea and follows it. It is not a matter of brain or education so much as of purpose joined to energy and labor. The salesman or manager or bookkeeper or secretary can lift himself to a higher plane of service and rewards if he prepares himself diligently for larger work and pay. The small manufacturer, the company director, the broker—all can become enlarged in the nature of their enterprise and in the amount of their income—by resolutely setting themselves about the task of growing to be bigger-minded men.

Specialized information is the great idea. This is what the world pays handsomely for. And to acquire specialized information is really a simple matter, calling for the purposeful and faithful use of time. This chiefly.

One does not have to stop his ordinary work, or go to a university, or to any school. One can acquire the specialized information in the margin of time which is his own—in the after-hours of business. Which means: If a man will read the right kind of books or publications, and make himself a serious student at home, in his hours—the evening hours or the early morning hours—he can climb to heights of position and pay that will dazzle the inert comrades of his youth or day's work.

IF business—BUSINESS—is your chosen field of work, we counsel you to read each week THE FINANCIAL POST. It will stimulate you mentally. It will challenge you to further studious effort. It will give you glimpses into the world of endeavor occupied by the captains of industry and finance. With the guidance of the POST, and with its wealth of specialized information, you, a purposeful man, aiming to go higher in life and pay, will find yourself becoming enlarged in knowledge and ambition, and will be acquiring the bases and facts of knowledge which become the rungs of the ladder you climb by.

It is the first step which costs. But this cost is trivial—a single dollar. We offer you the POST for four months for a dollar. Surely it is worth a dollar to discover how right we are in our argument. If you have the will to go higher in position and pay, sign the coupon below.

THE MACLEAN PUBLISHING COMPANY, LIMITED,
—143-153 University Avenue, Toronto.

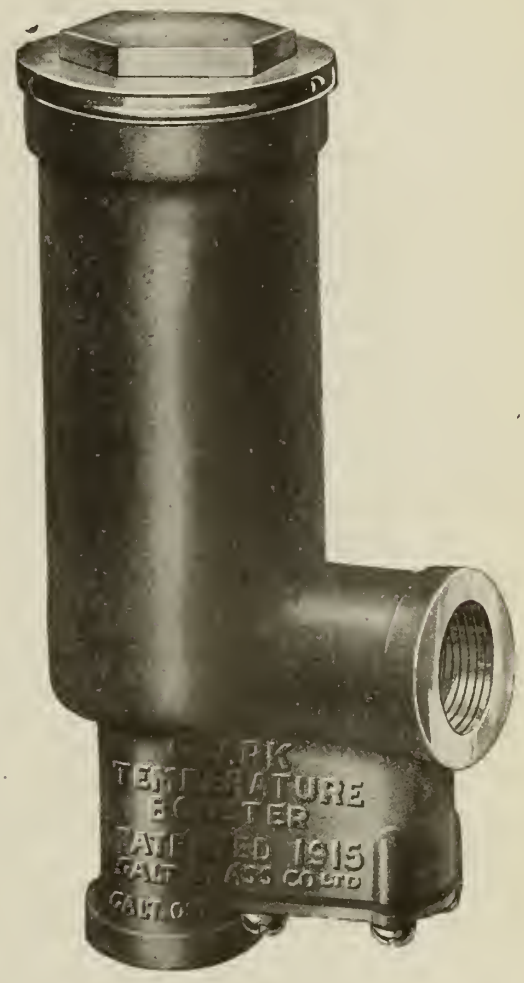
Clark Temperature Boosters

Actually Save Piping and Fittings!

SIMPLE TO INSTALL

TO be able to cut down the size of piping and fittings these days will help you considerably in the way of extra profits on work done! Or to look at it from an entirely different point of view, you are actually losing money if you do not fit a Clark Temperature Booster on every job.

You conserve material and also assist in saving coal, to the extent of 15 per cent.



Here's an example. A house requiring 10 tons of coal to heat it during a winter season will only burn 8½ tons and procure greater comfort from the fuel burned.

GALT BRASS CO., LIMITED

GALT :-: CANADA

Building Business During 1918

An Agency making a specialty of collecting building statistics reports that in the year 1918, there were buildings erected in Canada for residential, commercial and industrial purposes, to the value of about $97,000,000.00.

The thirty-five cities which issue building permits and make reports, account for about $36,000,000.00 of the same class of buildings in their territory, leaving a balance of $61,000,000.00 to be distributed over Canada in those sections of the country where no records or statistics are kept.

We call attention to this fact, as it shows the wonderful opportunities there are for Sanitary Engineers and those engaged in the Plumbing business, in localities which are not immediately supplied with sewerage or water systems. Every one of these buildings, whether it is a residence, warehouse or factory, could be and would be better for having sanitary appliances, and we believe that everyone of them would have these conveniences if they knew how easily they were obtained, and how small the cost would be in comparison with the total value of the building.

The PORT HOPE SANITARY MFG. CO., LIMITED, would like to develop this class of work, and assist the Sanitary Engineer or the Plumbers. The policy of the Company is to have its goods installed by the regular Master Plumber, as we know that fixtures properly installed have an added value and give greater service.

For this reason we distribute our goods through the recognized channels, that is through the regular Jobbing Houses, and have them installed by the regular or skilled Master Plumber. The Company is willing and anxious to do whatever is possible to promote and develop this class of business, and will gladly co-operate with either supply houses or Master Plumbers in the way of furnishing literature, cuts, illustrations and printed descriptions of the very excellent line of Plumber's Sanitary Ware which we manufacture in our Factory at Port Hope.

This is the time for all who are interested to get together and make a bigger and better business for the year 1919.

VOL. XIII. FEBRUARY 15, 1919 No. 4

Technical Education Necessary

Washington Government Sending Out Some Very Interesting Bulletins—What is Canada Doing?—Employer and Employee Both Must Co-operate if Export Trade is to be Encouraged or Home Markets Sustained

AMONG the many bulletins being published and issued by the Federal Board of Vocational Education one stands out away ahead of them all. We refer to Bulletin No. 20, Series 4, entitled "Buildings and Equipment for Schools and Classes in Trade and Industrial Subjects."

It is illustrated and contains some very valuable information for all who take an interest in technical education. For example, in discussing the need for industrial school buildings, it says: "The rapid growth of industrial schools is a development of the educational system designed to meet the demand in the industries for more skilled workmen, foremen and superintendents.

"The situation is rapidly becoming serious and must be met by a system of industrial training which will supply the ever-increasing demand of industry for intelligent man power. To meet this demand trade and industrial school are needed. Pupils must be given such experience and trade training as will fit them to enter successfully upon industrial employment. This education requires a new type of school building."

It will be seen by the above that it is becoming more apparent every day that all the training cannot be acquired in one shop, or even in a number of shops. In the plumbing trade, for example, we have our apprentices and journeymen, who are being taught just that quantity and quality of ways and means of doing work that comes within the scope of the particular shop in which these persons labor.

Just to cite one of the many examples which came to the writer's notice recently, a reader of SANITARY ENGINEER writes as follows: "Can you tell me what book or books I can procure which will show me how the various heating systems are installed, **and why certain methods are adopted? I know how to install quite a number of styles of heating systems. But I do not know why I install them in the way I do. I want to know the why.**"

There is the whole question in a nutshell. In connection with the plumbing business how many know the *why* of the practices followed in their every day work? And to be really honest about it, should we expect that the employer do all the training? Most decidedly not. The whole problem resolves itself down to this —that the more efficient a workman is the greater service the public receives. Then in all fairness the public should pay the piper by supporting technical schools either through the federal, provincial, or municipal governments. The writer would favor the Federal Government being the one to foot the bill for many reasons. Take for example the Toronto Technical School. There are pupils attending this school from all over the Dominion, if reports are true, and Toronto pays the bill, while the whole of the Dominion benefits.

Reverting back to the bulletin in mind, we will quote from another chapter under heading of "The Problem and Type of Equipment."

How Much Equipment Is Needed?

"If the pupil is to be fitted to meet the demands of industry, his training must be real. If it is real, it must be given in a shop making things on a useful or productive basis. Schools giving training in such subjects as wood-working, metal working, electrical work, etc., can readily find use for the work of the pupils, either in the building itself or in the school system. Every school should make a part of its own equipment.

The Factory Type of Industrial School

"The construction of the factory type must be of such a character as to provide a large amount of light. Extra light may be obtained by means of northern saw-toothed skylights, and thus avoid the glare of the direct sunlight. Windows should be planned to occupy as much of the exterior wall space as the construction and architecture of the building will permit. It is desirable that the windows be of factory construction with small panes, so that accidental breakage will not cause large expense for replacement. In the construction of the floors, a knowledge of the purpose for which the room is to be used is necessary.

"Each individual trade should be considered from standpoint of its necessities under commercial conditions, and the plan made to provide necessary floor space, light, door openings for admission of large work, and freight elevator service.

"Architects should not specify cement floors for shops in which edged tools are used, as it is impossible to avoid dropping tools on the floor. Whenever possible, wooden floors are preferable in such cases. Floors in which heavy machinery is to be installed should be designed to sustain the floor load weight with a sufficient safety factor to support future additions to the equipment. It is not always necessary to plaster interior walls. The roof construction, like the floors, necessitates on the part of the architect a knowledge of the purpose for which the room is to be used. Provisions should be made for numerous inserts in the ceiling and for suspending shaft hangers from steel girders whenever metal-working machinery is to be installed.

"*Ample locker space, wash and toilet rooms should be provided. The requirements for sanitation should be carefully observed. In planning the wash and toilet rooms of the new buildings, a careful study should be made of the flushing systems, and the location should be convenient to the shop rooms. It is not desirable to place wash rooms or toilet rooms in basements where the problems of sanitation are greatly increased.*"

The last paragraph is, or should be, of particular interest to the plumbing trade.

SANITARY ENGINEER has more than once voiced its disapproval of basement lavatory accommodation. But the plan seems to be followed by almost every architect. The wonder is that our residences are not fitted up with basement lavatories (to save room).

It is all a matter of education, and if our next generation of sanitary engineers are given the necessary technical training, not only will basement toilet rooms, but also underground public comfort stations, be things of the past.

Amount of Plumbing Class Equipment

To many small town governing bodies, it is often a question as to what kind of equipment is needed and the supply that would be necessary to install it. In this bulletin one section is set aside for this question.

Suggestion for Plumbing Class Equipment

"In designing a room for plumbing, pro-

vision should be made for more than the average ceiling height. This is necessary in order to provide for the installation of plumbing systems in practice houses of at least two stories and basement. In some cases, schools have arranged for two floors of the building to be given to plumbing, and cut large openings in the floors through which to extend the rough work. In any case, it is necessary to provide 500 to 700 square feet of earth floor space for installing drainage systems in tile and cast iron pipe.

"For a class of 10 to 15 pupils, the equipment should include:

"Three metal-topped tables, tops ¼ by 42 by 96 inches; 12 melting pots with gas burners (or plumbers' furnaces); 2 plumbers' gasoline torches; 1 skeleton of a building for practice work; 5 plumbers' kits; 6 each of 10-inch and 14-inch pipe wrenches; 3 each 18-inch and 24-inch chain tongs; 2 each 24-inch and 36-inch chain tongs; sets of stocks and dies, cutters, and supplies for lead work; a supply of water, gas, and lead pipe, fittings and plumbing fixtures for practice work, including water-closets, urinals, lavatories, sinks, bath tubs, trap vents, and drain and drainage pipes. Value of equipment, $1,000 to $2,500. Annual cost of supplies per pupil, $10 to $15."

Purely a Matter of Education

The writer has just read over a copy of the report of the recent convention held in Ottawa, under the auspices of the Canadian Building Industries. It was a gathering of men from all over the Dominion representing every branch of the building trade, and the sentiment expressed was simply splendid, particularly from those men who represented labor. Senator Gideon Robertson, the new Minister of Labor, told those present that "intensive efficiency will be needed to compete in foreign markets, efficiency on the part of both employees and employers. That efficiency be maintained is desirable from the standpoint of all interests concerned."

Thos. Moore, president of the Trades and Labor Congress of Canada, made some very sane, logical and sound remarks during his address. He said: "It is possible for labor to build up a species of autocracy of capital. If we cast our eye towards Russia, we can see the danger of too quick a relaxation and a too sudden swing of the pendulum without the preliminary education necessary.

"Some sort of legislation is needed to make satisfactory a democratic control of industry. This may be easy to-day in the mining or steel industries, or any other industry which is concentrated, and where the employers are few and the employees are closely gathered in groups or communities." Mr. Moore urged upon the employers present not to adopt too much of a "show me" attitude towards any new ideas of government. If they did they would be very much like the stone mason who was being told by a friend of his that concrete is just as permanent as stone. Replied the stone mason, "Well, friend, all that may be true, but show me the concrete building that has stood up as well and as long as stone." Of course that could not be done. It was an impossible attitude.

This instance and many more, while possibly of a political nature in many ways, are purely matters of education. It is just the same in our plumbing trade. We have too many "show me" employers and journeymen, and such being the case, we should endeavor to have boys trained, morally, physically, mentally and technically, so that they will be endowed with a broader vision on all subjects.

The days of duplication and complication are waning. Men are beginning to see that material and time has been and is being wasted in all industries. And not one whit less in the plumbing and heating trade than in other lines. It is all a matter of education, or lack of it, when we learn of fuel being wasted because heating plants are impractically installed. Not only fuel, but even lives. At the time of writing it is reported that four lives have been sacrificed in Toronto as a result of an improperly installed warm air furnace. No man would wilfully install a furnace in such a way as to be a danger to the occupants of the building if he has procured a proper training. He would be too conscious of the dangers lurking around such an installation. There is far too much tampering and peddling with goods and installations that if improperly constructed are a menace to health, and a waste of material.

We should every one devote more time and energy to this problem of technical education, and see to it that our employers as well as our employees are practical and possess a self-consciousness not to do work merely for price. We should all try and prevail upon our governments to bring into operation some form of Federal educational system that would bring technical education within the reach of all.

FROM PIPES AND BOILERS

Data are derived from experiments made with magnesium covering at the Mellon Institute of Industrial Research As a preliminary it is shown that the usual allowance for bare pipes of three B.Th.U. per degree difference per square foot per hour is erroneous. It is at least 50 per cent. more for 100 degrees difference and much more than this for 500 degrees difference. The experimental apparatus is described, together with methods of measuring the temperature and heat losses.

The results are plotted and show the great saving effected by covering. A formula is obtained:—

$$H = \frac{2K(T_1 - T_2)}{\log_e \frac{R_2}{R_1}}$$

Where:—

H = Heat loss in B.Th.U. per hr. per ft. length of covering.

T_1 = Temperature of surface of pipe in deg. Fahr.

T_2 = Temperature of surface of insulation in deg. Fahr.

R_1 = Radius of pipe in in.

R_2 = Outer radius of insulation in in.

K = Conductivity of the insulating material in B.Th.U. per sq. ft. of cross-section per in. thickness per deg. Fahr. temperature difference per hr.

The effect of wind was tested by means of a blower, and a wind of 30 miles per hour increased the loss from 0.302 B.Th.U. to 0.430 B.Th.U. per sq. ft of pipe surface per degree Fahr. temperature difference.

A series of curves are given showing the losses for temperatures varying from 100 to 600 deg. Fahr., and for thicknesses of covering from 0 to 5 in. From this series of curves the cost of steam for load factors varying from 20 to 80 per cent. for flat surfaces and round surfaces down to ¾-in. drain is obtained, which gives the proper thickness of covering to effect the minimum annual cost. These curves were confirmed by means of special experiments with a locomotive type boiler, first bare and then covered.

PLUMBER—A WORKER IN PLUMBUM

How many of us are there who know what a plumber is? or why he is called a plumber? Be it remembered that gas pipe fitters and steam pipe fitters, etc., are not plumbers. A plumber is a man who works in lead fixtures, doing such work as soldering lead pipe, etc. Iron pipe may be crowding in on the lead pipe to a certain extent, but that kind of work in simply pipe fitting. Plumbing properly appertains to lead and nothing else. Now lead is only a nickname. The proper name for this metal is "plumbum," and its chemical symbol is always Pb., and the workers in lead or plumbum were formerly known as "Plumbummers"; but here again a nickname or abbreviation has been worked in, with the result that the name has been haggled down to where it now is. There is no nobler profession than that of plumbumming, and it is about time that people would learn to talk the language correctly and give to these workers their proper name, to which they are justly entitled.—"Canadian Foundryman."

MAINTAINING HIGH VACUUM IN STEAM CONDENSERS

High-class condenser packing should be permanent; it should fill every crevice and be able to resist alkalis, acids, and salts in solution. There may be as many as 12,000 tubes (24,000 packings) in a single condenser. Cotton wick, coarse lace and fibre rings deteriorate when exposed to steam, air, oil and heat; their life is only about 1 year. Air leaks are often overlooked at the low-pressure cylinder valve and piston rod stuffing-boxes. A pine stick torch is useful in finding leaks at any point in the condenser or low-pressure pipe system.

Our Duty to Our Wounded Soldiers

The Clang of Battle is Over—Shedding of Blood Has Ceased—Shouting Should Be Over—Getting Down to Real Business the Duty of Every Man—We Want Soldiers of Peace and Progressive Industry

By THOMAS STANSFIELD

FROM time to time articles have appeared in SANITARY ENGINEER bearing upon the subject of our duty to returned soldiers. Quite a while ago I recall one article that voiced the opinion that almost every trade could, if properly organized, take care of its own trained wounded soldiers; men who, previous to the war, had been engaged in the sanitary and heating business.

Upon making inquiries I do not find that the sanitary and heating trade have done anything out of the ordinary for their returned men who have been incapacitated, and who can no longer work at the trade as in the days before they heard the call to arms to fight for democracy.

There is, however, some consolation in learning that here and there all over Canada, men have procured positions as inspectors of plumbing, thereby being able to use their brains and good practical experience for the benefit of the community from which they enlisted. But how about some real organized efforts on the part of, say the Canadian Institute of Sanitary Engineers, or the Canadian Society of Domestic Sanitary and Heating Engineers?

Possibly these organizations have felt that the problem was one to be dealt with and solved by the Dominion Government. And if such is the case, I think it would not be out of place to reprint the New Year's message from Mr. H. J. Daly, Director of the Repatriation Committee of the Dominion Government. This message is more than a message, it is a S.O.S. appeal to the intelligence of every Canadian. It speaks the truth and shows that every man, every member of any or every organization, should do something on his own behalf, or hold himself in readiness to help in any way possible to absorb the returned men into industry in the most natural way. This is what Mr. Daly says:

THE RESPONSIBILITIES OF PEACE

"The fight is over—yes, but not the war. The war will be over when those who went in Canada's name to fight the battles of democracy are so re-established in the land of their birth, or of adoption, as to be able to enjoy the fruits of democracy, and when the damage wrought to humanity by the war has been repaired to the utmost of human capacity.

"In order properly to discharge this debt it is necessary for every man, woman and child of the age of reason, to understand the cause of the war, to appreciate the extent of human sacrifices involved, to realize the benefits arising out of the war and fully and constantly to recognize their obligations to their fellow men.

"Such an understanding cannot be imparted by anyone at a governmental agency. It requires the individual effort just as winning the war required individual effort. It furthermore requires the effort of every medium or organization that has to do with the social and economic betterment of all the people. Therefore, in our efforts to readjust conditions to a better basis we want the assistance of religious, social, fraternal, business, educational and all other classes of organizations. We want them to help as freely now as they did during the war—even going to the extent of submitting to direction when same is necessary. Such organizations are the agencies to create a community atmosphere of contentment; and they were never so much needed as they are to-day."

The above message has the right ring to it. It is a call to arms of every industry to absorb as far as possible those men who can perform some branch of the trade they have learned. Their training cost them and the trade something previous to the war, and there can be no logical reason why their skill cannot be put to some use.

In the first place the secretary of every association should procure a list of all journeyman plumbers or fitters and ascertain their physical condition as well as their practical experience, and then positions should be found them as bookkeepers, foremen, inspectors, etc.

In the case of positions as plumbing inspectors, some provisions would have to be made; for example, every district, whether an incorporated township, village, town or city should have some by-law governing the installation of plumbing and heating, etc. Every province has its health department, and every province should have in operation a plumbing by-law. Then there should be provincial plumbing inspectors in unorganized districts. These provincial inspectors could supervise the plumbing installed in country homes, working under authority of the local health department. Or, where a town or village was not big enough to support a plumbing inspector, his salary should be paid out of the taxes levied by the province.

Just a few days ago I had a case put up to me where certain sanitary inspectors in Regina were condemning the use of septic tanks and were in favor of installing cesspools. Such men have no right, honorably, to be appointed to such positions. They do not know the first principles or laws of biology or they would never take exception to septic tanks. But men who have had previous experience in installing small sewage plants, plumbing and heating, etc., and pneumatic water systems, men who have been to the war and come back maimed, these should be placed in such positions as would enable them to use their previous experience for the public's benefit.

Canadians owe a solemn debt, a debt beyond repayment, to the men of their Expeditionary Force, who, let us never forget, placed themselves between us and the German host. But if our obligation to them can never be discharged in full, our simple duty as their fellow citizens will not be accomplished until the last man to leave the army has been re-established in our national life. He must be given a chance to re-discover himself in a world that will be strangely new.

There is, perhaps a danger in the demonstration of welcome that meets the returning soldier. The brass band, the cheering and the speeches are right and fitting in their proper place, but these we must follow up with patient, determined effort to help the homecomer find his feet and become a citizen again. Government machinery, however effective, and however extensive, can only work in an atmosphere of co-operation. Co-operation is the oil which keeps the machinery running. Let no man criticize who will not help.

Demobilization is a misleading word. It suggests undoing, the scrapping or the putting away of a machine. We are really putting nothing away; on the contrary the resources, human and material, which we organized to win a war, must again be concentrated on the tremendous effort of restoration, readjustment, reconstruction—three R's as fundamentally important as the three R's of our school days. We are not reverting to a pre-war condition. "Back to mufti" is perhaps a misleading phrase. We are not going back; we are going forward, and with the stimulus of a new purpose. The need for action is now as urgent as it ever was, for we are not demobilizing—we are mobilizing for peace.

In conclusion, allow me to state that if ever the craft had an opportunity to get a hearing from the Government, it has one now. The whole trade from coast to coast should be willing to act in a concerted way to lay a plan before the Canadian Government, showing the need for standardization of plumbing goods, of plumbing by-laws, and of proper Dominion-wide plumbing inspection. Then we could give practical positions to men of our craft whose previous training makes them capable servants.

We must look back to those men on the battlefield. We must realize that they never shirked, never questioned when duty called, and now that it is our turn we too must do all in our power to make a useful citizen of every soldier man, whether married or not. Not in a charitable way do these men want assistance, but to go on doing their bit according to their abilities. If we need any spurring on we have only to realize the great moral fibre of our Canadians. One has only to think of the half million men who were prepared to give their all for the sake of an ideal, and this is where lies our example for the years to come. Our Canadian boys had a job to do. They finished it magnificently. We

the "roughing in" as soon as we can. As an army of reconstruction we can follow up the work these men, on their part, "finished" in their endeavor to make this world a better place to live in.

As an army of reconstruction we can follow up their work; make good their gains. Only as a united army of reconstruction can we carry the country over the difficult road from war to peace. That is our duty to our wounded soldiers.

TOPICS OF INTEREST

LOSS OF HEAT IN CHIMNEYS

The growing need for economy in fuel makes the following description and estimation of the loss of heat in chimneys both interesting and useful.

By far the largest part of the chimney loss is heat held by the gases because of the high temperature at which they leave the boiler. This part of the loss is unduly large when too much air enters the furnace and the boiler setting; it can be greatly reduced by decreasing the air and by lowering the temperature of the gases leaving the boiler. To burn 1 pound of coal requires about 14 pounds of air. This air enters the furnace at atmospheric temperature, and leaves the boiler at a temperature about 500° F. higher. It carries with it all the heat it absorbed in being heated through this temperature range of 500 degrees. Each pound of air absorbs approximately one-fourth of a heat unit (B.T.U.) for each degree of temperature rise. Therefore, each pound of air, in being heated 500 degrees, absorbs

$$\frac{500}{4} = 125 \text{ heat units.}$$

14 pounds of air absorbs $14 \times 125 = 1{,}750$ heat units. If, instead of 14 pounds of air being admitted for each pound of coal fired, 28 pounds is admitted into the furnace, the heat carried away by this weight of air will be $28 \times 125 = 3{,}500$ heat units, or twice as much as in the furnace using 14 pounds. Again, if the gases should leave the boiler at a temperature 1,000 degrees higher than atmospheric they would carry away twice as much heat as gases heated to only 500 degrees, and 1 pound of gas would carry away

$$\frac{1000}{4} = 250 \text{ heat units}$$

Therefore, the amount of heat carried away by the flue gases depends directly upon the weight of air entering the furnace and the temperature rise. Air entering the furnace in excess of about 14 pounds to a pound of coal burned is not necessary to good combustion, and the heat it carries away when leaving the boiler is wasted.

The chimney loss also includes the heat units in the unburned combustible gas and in the visible smoke. This part of the loss is due to the lack of enough air at the right time and place to burn the gases completely. Thus one part of the chimney loss is due to excessive supply, and the other part to insufficient supply of air. Hence, there is always the possibility that by reducing the one part of the loss we may increase the other part. However, in the average plant the loss from excess air supplied to the furnace is far larger than the loss from incomplete combustion, and the sum of the two can be greatly reduced by decreasing the excess of air. In many plants both parts of the chimney loss can be reduced by more careful firing.—(U. S. Bureau of Mines).

CENTRALIZED INSTRUMENTS IN BOILER ROOMS

It is suggested that an operator's desk or bench-board will soon form a feature of modern boiler room equipment. Instruments on the board will give the operator a complete operating analysis of conditions existing in the furnaces and boilers, and the greater part of the work will be handled automatically. Portable instruments have their uses, but permanent and centralized instruments are needed to give operators full control over the rapidly varying conditions encountered in the average plant.

SLIDE VALVES IN PLACE OF STOP VALVES

Stop valves are now being largely replaced by slide valves, especially in connection with turbine work. In small stations the change has already been made, chiefly because of the large dimensions of the valves and the high velocity of the steam.

In marine engines the change has not been so marked owing to the unreliability of the slide valve, especially for superheated steam.

Disadvantages in the construction of the slide valve are the uneven wearing of the bearing surfaces and liability of the spindle to fracture owing to jamming caused by uneven expansion.

The article describes and illustrates a slide valve by Claassen, which is said to do away with all these disadvantages and can be used even for superheated steam.

NEW COMFORT STATION FOR PARK DISCUSSED

At the inaugural meeting of the Waterloo Park Board held recently, the question of erecting new comfort stations at the park were discussed and it was decided to have a committee of the Board interview the Finance Committee of the Council and ask for a grant of $1,500 or $2,000 to help defray the cost of the work. If the Council does not consent to this it is likely debentures will be issued.

WATER-HAMMER IN MAINS UNDER PRESSURE

The article by the Comte de Sparre, professor at Lyons, says that the arrangements that are frequently employed to cope with the effects of water-hammer such as equilibrium pipes, air vessels, valves or buffers which open a supplementary orifice for the escape of the water should fulfil certain conditions if they are to give the best results. The author subsequently applies the results obtained by calculation to the special cases of buffers or shock absorbers and of vertical overflow pipes. In another article he hopes to deal with their application to relief pipes which do not overflow, and also to reservoirs.

The author first considers a pipe furnished with one of the arrangements alluded to above, and applies the theory of dynamic forces to the water contained in the pipe between a section next to the source of the water and another section near the outfall. This is taken from an instant when the water is flowing in its ordinary course with the velocity v_0 up to a final instant when the velocity of the water at all the points in the pipe considered are again the same and equal to v. He then discusses this by the aid of the calculus and offers equations representing the conditions. Going further into detail he takes account of the elasticity of the water and of the pipe in the case of a shock-absorber which opens a relief valve when the force of the water-hammer attains a given amount. Formulae are given for application in such cases.

COMBUSTION OF COAL ON FURNACE GRATES

In a hand-fired furnace about one-half of the combustion takes place in the fuel-bed and one-half in the combustion space. The burning fuel-bed acts principally as a gas-producer and a gas-retort; in it the solid fuel is gasified by the partial combustion of the fixed carbon, and by the distillation of the volatile matter. The gases rising from the fuel-bed contain at times as much as 32 per cent. combustible, and no free oxygen to burn it. Hence, to burn these gases, air must be admitted over the fuel-bed and mixed with the combustible. and the mixture burned in the combustion space. The oxygen flowing up through the grate is all used as it passes through the first three or four inches of the fuel-bed. The products of combustion in this part of the fuel-bed are largely CO_2, and a smaller percentage of CO. At a height of three to four inches from the grate the CO_2 content of the gases reaches a maximum of 12 to 18 per cent. As the CO_2 passes through the upper layers of the fuel-bed it is reduced by contact with the hot coal to CO, which, with the combustible gases distilled near the surface of the fuel-bed, constitutes 16 to 20 per cent. of the gases rising from the fuel-bed.

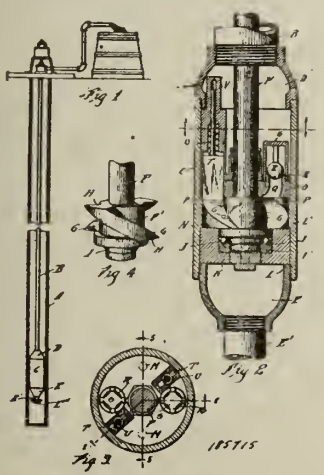
New Canadian Patents

No. 185,715.

Walter R. Woodford, Cleveland Heights, assignee of Samuel Lippert, East Cleveland, both in Ohio, U.S.A., 23rd July, 1918; 6 years. Filed 27th June, 1917. Receipt No. 231,439.

Claim.—1. In a pump, the combination of a cylindrical pump chamber provided with induction ports leading into the bottom thereof, and with eduction ports leading from the top thereof, a vertically extending pump tube whereinto the eduction ports are adapted to discharge, check valves for the eduction port and adapted to relieve the pump chamber from the pressure of the liquid in the tube thereabove, rotary helical vanes in said chamber corresponding to said eduction ports, said vanes being circumferentially spaced, blades slidably mounted in the top of the said chamber adjacent to said eduction ports and adapted to be elevated by said vanes, means for projecting said blades downwardly to the bottom of said chamber when released by said vanes, and means for rotating said vanes.

2. In a pump, the combination of a cylindrical pump chamber provided with induction ports leading into one end thereof and with eduction ports leading from the other end thereof, a vertically extending pump tube communicating with the eduction ports, check valves controlling the eduction ports and adapted to relieve the pump chamber from the pressure of the liquid in the tube thereabove, rotary helical vanes in said chamber corresponding to said eduction ports, said vanes being circumferentially spaced, blades slidably mounted in guideways in the delivery end of the pump chamber adjacent to the eduction ports, tubular extensions for said guideways, springs in said extensions tending to thrust the blades toward the induction end of the pump chamber, and means for rotating said vanes.



No. 185,715. Pump.

3. In a pump, the combination of a cylindrical pump chamber provided with induction ports leading into one end thereof and with eduction ports leading from the other end thereof, a vertically extending pump tube communicating with the eduction ports, means for relieving the pump chamber from the pressure of the liquid in the tube thereabove, rotary helical vanes in said chamber corresponding to said eduction ports, said vanes being circumferentially spaced, blades slidably mounted in the delivery end of the pump chamber, means for moving the blades toward the induction end of the pump chamber, and means for rotating said vanes.

No. 185,640

William S. Mills, Florence, South Carolina, U.S.A., 23rd July, 1918; 6 years. Filed 12th April, 1918. Receipt No. 293,538.

Claim.—1. A grease trap of the character described, comprising an exterior imperforate casing closed at one end and having a cover at the other end and having an inlet opening adjacent last-named end of the casing, and an outlet opening adjacent the other end of the casing, and a grease strainer having an imperforate portion formed with an opening adapted to register with the inlet opening of the casing and with a wire gauze portion, the strainer fitting the interior of the casing.

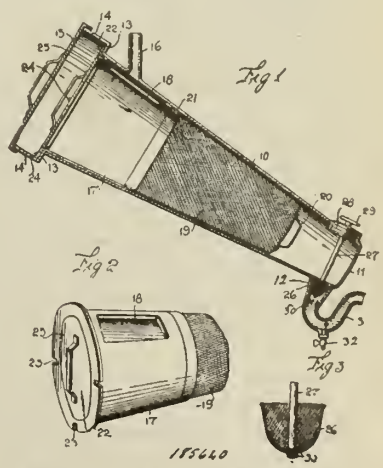
2. A grease trap of the character described, an outer casing tapered longitudinally and downwardly inclined and closed at its smaller end, a cover for closing the upper end of the casing, an outlet pipe leading from the small end of the casing, an inlet pipe leading into the side of the casing adjacent the large end thereof, and a strainer disposed within and fitting the casing having an imperforate portion provided with an opening adapted to register with the opening of the waste pipe and having a portion formed of wire gauze.

3. A grease trap of the character described comprising a tapered outer casing having an outlet at its small end, a cover closing the large end of the casing, the casing being formed with an inlet inward of the cover, a strainer removably disposed within and fitting the casing and having an elongated opening adapted to register with the inlet opening of the casing and means permitting the removal of the casing but holding the casing from rotation and with its inlet opening registering with the inlet opening of the casing.

4. A grease trap of the character deing having an outlet at its small end, a scribed comprising a tapered outer cascover closing the large end of the casing, the casing being formed with an inlet inward of the cover, a strainer movably disposed within and fitting the casing and having an elongated opening adapted to register with the inlet opening of the casing, and means permitting the removal of the casing but holding the casing from rotation and with its inlet opening registering with the inlet opening of the casing, and a cover fitting within the inlet end of the strainer.

5. A grease trap of the character described comprising a downwardly inclined casing tapering toward its lower end and formed at its lower end with an outlet pipe, the upper end of the casing being flanged and then extended upward and having a uniform diameter and being screw-threaded, a closure for the screw-threaded end of the casing, an inlet waste pipe opening into the casing below the flange thereof, and a strainer disposed within the casing comprising a conical body of wire gauze and an annular imperforate body having detachable engagement with the wire gauze body, said imperforate portion being formed with a longitudinally extending inlet opening adapted when the strainer is in place to register with the inlet opening of the casing, said imperforate portion of the strainer being provided with a flange fitting within the flanged portion of the casing, the flange and casing being formed with means permitting the removal of the strainer from the casing but permitting the rotational movement of the strainer.

6. A grease trap of the character described comprising a tapered casing having an outlet extending from its small end, the casing being closed at its small end, a cover for the large end of the casing, an inlet pipe leading into the casing adjacent its large end, a strainer removably disposed within the casing and into which the inlet pipe discharges, an auxiliary strainer seating in the inlet pipe at its junction with the casing, a plug having screw-threaded engagement



No. 185,640. Grease Trap.

with the wall of the casing opposite the inlet pipe, and a rod extending from said plug and connected to the auxiliary strainer.

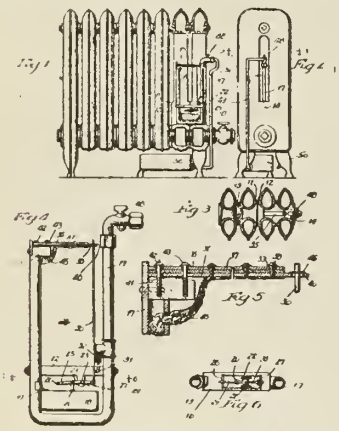
No. 185,467

Frederick Lindmeier and Justus Lindmeier, co-inventors, both of Oak Park, Illinois, U.S.A., 16th July, 1918; 6 years. Filed 23rd November, 1917. Receipt No. 287,951.

Claim.—1. A humidifier system comprising a tank associated with a radiator, a connection for carrying water from the heating coils of the radiator to said tank, a valve controlling the flow of water through said connection, a float controlling said valve to maintain a substantially constant level of water in said tanks, and a hygrostatic element for preventing the ingress of water when the atmosphere is already sufficiently humid.

2. In a humidifier system the combination with a radiator of a tank associated therewith, a float in said tank, a valve controlled by said float, a hygrostatic element for preventing the opening of said valve when the atmosphere is already humid, and a pipe leading to said valve from a source of water supply.

3. In a humidifier system the combination with a radiator of a water tank associated therewith, a water pipe connecting with the heating elements of the radiator, a valve in said pipe, a means controlling the ingress of water through said valve to prevent the flow of water there through when the atmosphere is already humid.



No. 185,467. Humidifier.

4. The combination with a heating system of means for humidifying the air heated by said system, comprising a water tank, a valve controlling the supply of water to said tank, means controlled by the level of the water in said tank for opening and closing said valve, and a hygrostatic element for holding said valve closed when the air heated by said system is sufficiently humid irrespective of the level of the water in said tank.

5. A unit for a humidifier comprising a pipe connection provided with a valve seat, a support for said pipe connection, a valve co-acting with said seat, a float pivotally mounted in said support and connected with said valve, and a hygrostatic element mounted on said support, and having a lost motion connection with said valve.

6. A unit for a humidifier comprising a pipe connection provided with a valve seat, a support for said pipe connection, a valve co-acting with said seat, a float pivotally mounted in said support and connected with said valve, and a hygrostatic element mounted on said support and connected to said valve.

7. A combined radiator and humidifier comprising a plurality of vertically arranged radiator sections, each section including a pair of spaced heating conduits, a pair of vertical flanges, and a base flange forming a part of each of said sections, arranged to co-operate with similar flanges of the adjacent section to form a single humidifier chamber wholly within the radiator, each of said vertical flanges extending from one end of said heating conduits and lying in a plane intermediate, the inner and outer faces of the conduit to form a holder for a sheet of absorbent material.

No. 185,555

The Liberty Aeroil Burner, Inc., assignee of Valerian J. O'Farrel, both of New York City, assignee of Herbert E. Rider, Brooklyn, New York, both in the U.S.A., 16th July, 1918; 6 years. Filed 3rd October, 1917. Receipt No. 285,927.

Claim.—1. In an oil burner of the class described, a retort comprising a shell, and a plurality of corrugated rods of metals having different co-efficients of expansion mounted in contact with each other within the shell.

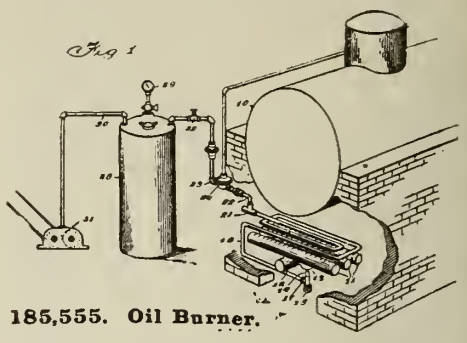
2. In an oil burner of the class described, a retort comprising a shell and a plurality of rods of metals having different co-efficients of expansion mounted within the shell, all in contact with each other and secured at one end, the movements of the rods relative to each other and to the tube with changes of temperature preventing accumulation of carbon on the rods and in the tube.

3. In an oil burner of the class described, a retort comprising a tube and a plurality of rods of metals having different co-efficients of expansion arranged within the tube in contact with each other and secured at one end, said rods being corrugated so that their relative movements with changes of temperature, reduce the accumulation of carbon on the rods and in the tube.

4. In an oil burner of the class described, a burner and a coil mounted over said burner, and comprising a tube and a plurality of corrugated rods of metal having different co-efficients of expansion mounted within the tube in contact with each other and secured at one end, said rods forming interstices between them for the passage of foil and serving to conduct heat through the tube.

5. In an oil burner of the class described, a burner head comprising a plurality of detachable burners, a distributing duct supporting the burners and disposed centrally under the burners, an inlet for a mixture of air and gas formed in the distribution duct, a nozzle under the inlet, and a retort connected to the nozzle and comprising a shell having a plurality of rods of metals having different temperature co-efficients mounted therein in contact with each other.

6. In an oil burner of the class described, a burner head, and a retort disposed over the burner head and terminating in a nozzle for supplying a gaseous



185,555. Oil Burner.

mixture to the head, said retort comprising a thin tube having a plurality of small rods therein in contact with each other to conduct heat throughout the tube, said rods being of metals having different temperature co-efficients to utilize the different expansions thereof with changes of temperature to prevent accumulation of carbon within the tube.

ADMISSION OF AIR TO FURNACE FIRES

The wasteful burning of coal takes, in large measure, the form of incomplete combustion. To burn 1 pound of the average coal requires about 14 pounds of air. The air is just as necessary for the combustion as is the coal. When the fuel bed is kept level and 4 to 6 inches thick, only about 7 pounds of air can be supplied through the fuel bed for each pound of coal burned; increasing the rate of air supply merely makes the coal burn faster. The other 7 pounds has to be supplied immediately over the fire. The air supplied through the fuel gasifies the coal, and the gas must then be burned in the combustion space. This is true, no matter how much air we try to force through the fuel bed; if we force through 7 pounds of air we gasify 1 pound of coal; if we force through 70 pounds, we gasify 10 pounds of coal, and if we force through 700 pounds, 100 pounds of coal is gasified, and so on. In other words, the amount of air supplied through the fuel bed determines only the rate of combustion. The completeness of the combustion is determined by the amount of air that is added and mixed with the combustible gases over the fuel bed. The gases mixed with the air burn in the combustion space, and the flames are the visible evidence of this burning of the gases. If there were no gases burning over the fuel bed, there would be no flame.—(U. S. Bureau of Mines).

VOL. XIII. FEBRUARY 15, 1919 No. 4

THE APPRENTICESHIP PROBLEM

IN spite of the fact that no small amount of interest has been taken in the apprenticeship problem, the fact remains that more work must be done and more attention paid if the sanitary, heating and ventilating profession is to maintain the tone standard it deserves.

A representative of SANITARY ENGINEER interviewed quite a number of employers as well as journeymen recently, with a view of procuring some first-hand information as to the opinions of both sides. And some very interesting, as well as lamentable, facts were disclosed.

In one large city the following views and opinions were expressed: "We simply will not employ a union man in our shop," said one. When asked why, it was stated that they had tried out union men and while peace reigned before such men were employed, trouble came soon after, and a score and one reasons, which must be frankly admitted were unreasonable. Another employer stated that they employed none but union men, got good service from them and all were first-rate mechanics. But the apprenticeship question was a big obstacle. This employer gave some startling facts. Said he, "What are we going to do for men very soon? We are not training any Canadians to work at the trade. We procure all our full-fledged mechanics, or nearly all, from England or Scotland, and many of our men right now are leaving us to go back home. What we want more than all is a real understanding with the trade union men. We must and should work with them, and we should meet them with a fair agreement that these apprentices would not be used to the detriment of the journeymen. There is a suspicion in the minds of both the employers and employees which almost amounts to fear, and until these conditions are remedied I do not think that the apprenticeship problem, and mind you, it is a problem, will ever be solved."

A number of other employers, too, were interviewed, and all more or less expressed similar views. One employer stated that he would run his business just as he liked and would employ whom he chose, union or non-union men. But such a stand is not by any means commendable, because in these days we must forget such sentiments. In fact, co-operation is the present key to progress, and unless capital and labor, if you so wish to term employer and employee, does not co-operate both will suffer.

Interviewing a number of journeymen, both union and non-union men, the following opinions were expressed: "The trouble is that instead of employers getting right down to brass tacks and keeping men in work steady they allow our trade to work in fits and starts. They rush into harness in spring, take jobs at unheard of low prices, and when the building season ends we get laid off. Such conditions mean that we have to demand high wages to keep the wolf from the door in winter. And somehow we must regulate the number of apprentices in each shop so as to ensure more work for the 'grown-ups.' If every boss in our trade would plan ahead, take more interest in creating work, they would benefit just as much as we would and more, because their capital would turn over oftener."

Another journeyman when asked about the apprenticeship question, asked another question before he would answer ours. "What appears to be the trouble with our employers? They are only reaping what they have sown. I don't refer only to plumbers, but to the whole building trade. Why did capital close up so —— tight when war was declared? We were fired; no work for months and months. Buildings that were under construction were stopped, and we are experiencing a shortage of houses chiefly because of the stand which capital and employers in general took when war was declared. And now when building operations are likely to become more active, the employers begin to yell for more apprentices. What plans are there being made to absorb these young fellows when the present shortage has been supplied? We are only human. We are only acting in self-defence, and if we do not get together soon the problem will be taken out of our hands to solve. This man frankly admitted that there should be more apprentices employed, but was not prepared to say what per cent per shop should be permitted.

Another journeyman was not in favor of technical schools under present management. He was of the opinion that in every technical school there should be a voluntary committee appointed or formed, representing the school, the employers and em-

ployees. And that figures should be procured showing just how many apprentices could be absorbed and proved same accordingly. He also suggested that every plumbing class formed should comprise boys who were employed during the day at the trade and that such apprentices should be given a number of half-days per week to attend school instead of depending solely upon night study and attendance.

Now, it will be seen by the opinions expressed of those men interviewed that there is a feeling in the minds of both employee and employer that something should be done and done quickly. Would it not be a good thing if both interested parties would try and get together on this subject, thrash it out and have this problem settled on a fair and satisfactory basis, this year of our Lord, nineteen hundred and nineteen?

LET YOUR LIGHT SO SHINE

THE greatest business topic that is being discussed these days is that which has a bearing upon the unsettled state of the world as a result of the sudden cessation of war, and the manufacturing of goods required to carry on the war. Some call it "a period of reconstruction," others refer to the problem as being one of reorganization. In some countries both terms would be correct, because there has been a great deal of loss in buildings, land has been torn up, towns levelled. In such countries both a period of reorganization and reconstruction must exist.

But in Canada and on this continent our problems are somewhat different. Canada has increased in population and no buildings have been erected to take care of material growth. Our soldier boys are coming back with wives and families, all of whom must be housed. Industries have sprung up as it were "in a night," and these industries must be kept going. So that in Canada we would be more correct were we to refer to present conditions as requiring a reorganization of our forces; forces of capital and forces of labor.

There never was such a feeling of suspicion in the minds of capital and labor as there is to-day. This feeling is very much uncalled for, and instead of both parties insisting that they will "let their light shine," each are trying to dim the other's light, notwithstanding that each must admit that the other is vitally necessary to his welfare.

When a little boy at school the writer remembered well the fable of the two cats who jointly had stolen some cheese. They could not decide how to divide it; one wanted more than the other, etc. So it was finally decided to take the cheese to Mr. Monkey, the judge. He, of course, like most judges, looked very, very wise, understood the case perfectly well and forthwith broke the cheese in two, placed the pieces on the scales and found that one piece was heavier than the other. He at once bit a large piece out of the heavier, making it the lighter piece, and repeated the operation, biting from one piece and then the other until all the cheese was gone.

That's just about like what capital and labor are doing right now on this continent.

Both sides should get together and treat each other as a body of intelligent men; neither should try to deceive the other. Those days are gone. The cat with the biggest piece of cheese will simply have to agree with the other cat to have both pieces accurately weighed and divided in a proper scientific manner, adopting such methods as will be up-to-the-minute, not such as were adopted under the old antiquated law of supply and demand. Then let's all get together and supply the demand—only supplying what is demanded — because, after all, every person is the law of supply and demand in himself.

Let us all do our utmost to create both supply and demand, let us all make our light so shine, etc., and not spend too much time in dimming the issue as appears to be the case to-day. Everybody knows there is a shortage of houses. Let's get together and work out ways and means to provide those homes

Every sanitary and heating engineer knows that the farmer will be a better, healthier and more efficient citizen if his home is fitted up with sanitary plumbing. Very well, let's get down to advertising and telling the farmer what we can do for him. Go out and paint pictures to him, show him right on the spot what you can do for him. "Let your light so shine."

A Real Lesson in Thrift

A COLORED gentleman went into a down-town store to buy a suit of clothes. He wanted to pay about $20. In fact he had that much set aside for the purpose.

The clerk, well schooled in the art of making people buy what they couldn't afford to pay for, had the customer prancing around in a $35 outfit, and was telling him that that was the sort of togs he should wear.

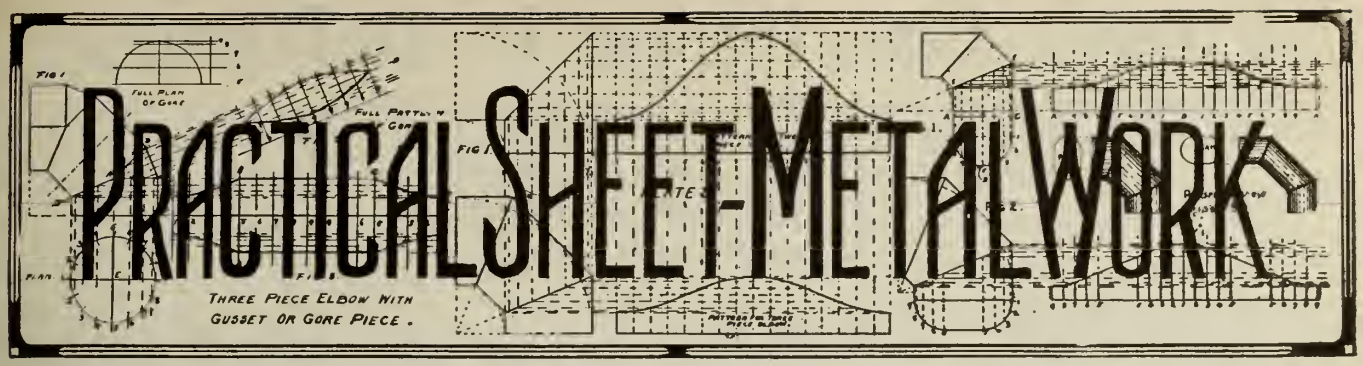
The colored man simply smiled, stuck out for a $20 outfit, and remarked "I never hang my hat no higher than I can reach."

And there's quite a heap of common sense and wisdom in the saying.

Is there anything more painful than witnessing a man with a $2,000 income trying to make a splash that looks like that of his neighbor who reaches through the cashier's wicket for $5,000 per annum?

And yet it's being done all the time. Two dollars can't go as far as five, and two thousand can't do what five thousand can. That looks simple enough, but the people who fail to realize that fact would make quite a heap were they all pitchforked up together.

That colored man preached a pretty fair sermon on "thrift" when he announced his text as "I never hang my hat no higher than I can reach."



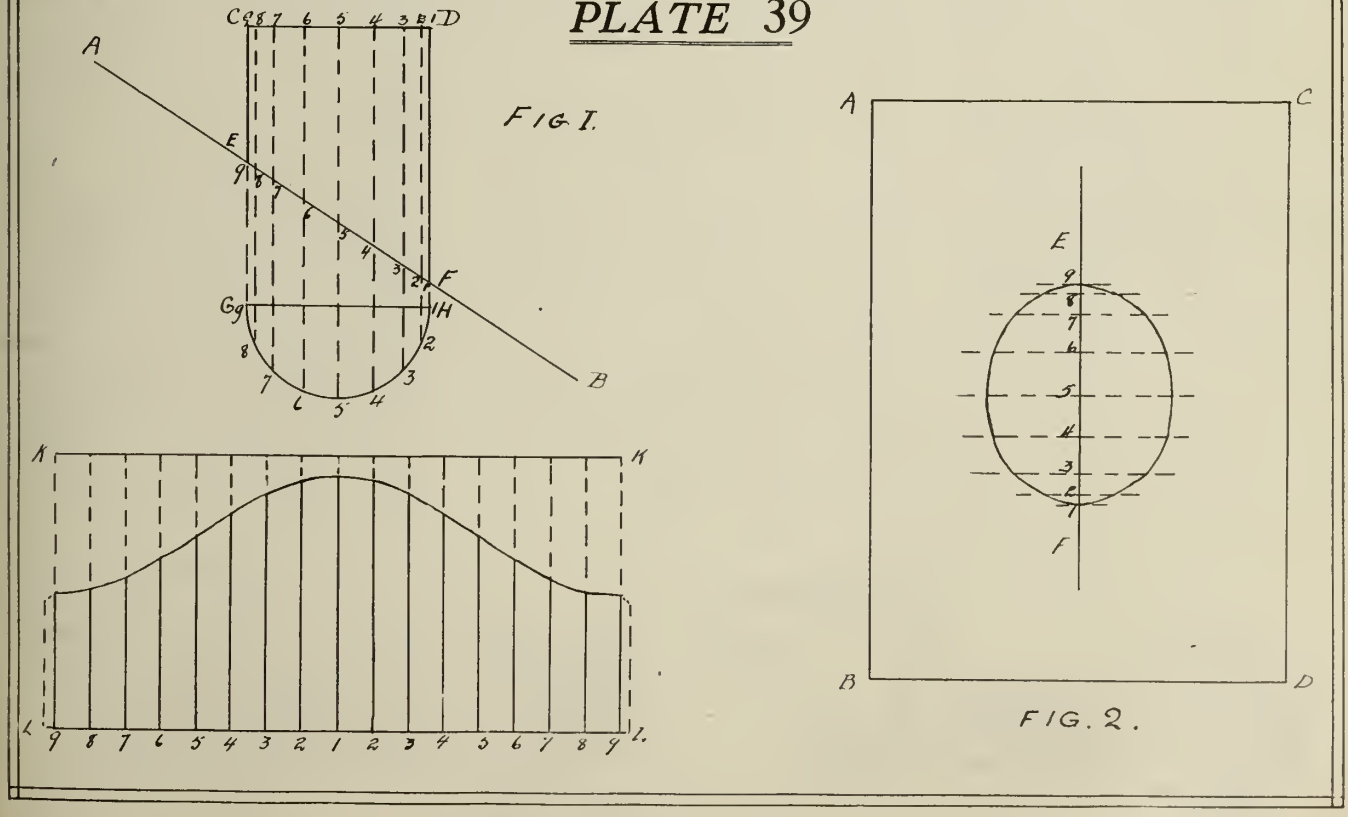
BY THOMAS STANSFIELD

IN this is shown a round pipe resting on a roof of one pitch or slope, with flange for pipe at roof line. In Fig. 1, or the side view, let A-B represent the slope of the roof, and C-D-E-F the elevation of pipe joining same. To develop pattern for pipe with cut to fit the roof proceed as if cutting a section of an elbow, on C-D or on a line parallel to it as G-H, draw a half section of the pipe as shown by semicircle, and divide into a number of equal parts as shown by 1, 2, 3, 4, etc., from these points draw lines parallel with D-F, extending them until they join the lines C-D and E-F, our next step is to draw two parallel stretchout lines as K-K and L-L, now erect lines at right angles to L-L joining to K-K as shown line on either end at K-L. From this point set off with the compasses or dividers the spaces 1, 2, 3, 4, etc., on section on line G-H, repeating to make the circumference complete. With compasses measure distance from line C-D, to the point on line E-F which is intersected by the lines drawn from points in section on line G-H, commencing at C, measure the distance C to E, and set off from line L-L on line K-L. Measure the next line 8, to its intersection at E-F, and set off from L-L on second line, which can be numbered 8 to correspond to line on C-D. Measure the next line 7 to its intersection with E-F and set off from L-L on line 7. Proceed in same manner with remaining lines 6, 5, 4, 3, 2, 1, which will form one-half the pattern, to complete full diameter repeat as shown on lines 2, 3, 4, 5, 6, 7 in the same manner. A line drawn through the points obtained will give outline of pattern required.

To obtain pattern of flange with opening for pipe, draw the outline of flange as shown in Fig. 2, by A-B-C-D, draw a line through the centre of flange, parallel with A-B, as E-F, on this line set off the spaces between E and F, found by the lines drawn from section G-H in Fig. 1. With compasses measure from line G-H to the points of circumference as marked by divisions 1, 2, 3, etc., and set off on both sides of line E-F, on flange, Fig. 2. Setting distances obtained on lines numbered to correspond, as shown at point 1 on line 1, 2 on line 2, 3 on line 3, etc. A line drawn through points obtained will give outline of opening in flange to receive pipe.

(To be continued.)

PLATE 39



Proper Gas Piping in Buildings

Larger-sized Pipe Saves Gas—Greater Pressure of Gas Passing Through Bunsen Burner Creates a Higher Vacuum of Air—Flame is Hotter, Thus Requiring Less Time to Cook or Boil Food on Gas Stove—Same Applies to All Gas-burning Appliances

By GEO. W. ALLEN, Toronto

I WAS very much innterested in your article entitled "Pipe Sizes for Gas Installations," and having had a good many years' experience in gas appliances, gas manufacturing and installations of almost every type, I thought a little explanation as to why ample sizes of pipe should be used, would be of interest. I have heard plumbers, contractors and architects express great surprise when they have been asked to install larger sizes of pipe.

The argument often put up has been that the small holes, or outlets at the burner of each gas fixture, did not by any means represent the total area of the bore of main gas pipes installed.

If architects, plumbers, and gas fitters fully realized the importance of proper gas piping installations there would be less cause for complaint among gas consumers about high gas bills. It is a common belief among these men and others that gas companies desire large gas pipes so that the consumer will use more gas. That this calculation is a gross error cannot be disputed. The writer's own experience with the solving of gas account complaints have, in many cases, been traced to faulty piping. I will not go into long technical explanations relative to the reason why large gas pipes save money to the consumer, but will endeavor to explain the reason in as non-technical language as possible, in order to convey the main idea to the reader. All installations for gas appliances require maximum pressure in order to give maximum service. The large pressure of gas does not necessarily mean a large flow of gas through the burners. But it does mean that if a "pin-head flow" of gas is allowed to enter a Bunsen tube at high pressure, a corresponding high vacuum is set up with the air in the burner, thereby causing a large inrush of outside air to enter the air mixers and to mix with the gas. The result of this is a uniform mixture, and if ignited will give a maximum amount of heat at the burner. It therefore stands to reason that if the pressure is checked by reason of small pipes the gas valves will have to be opened wide at the burner in order to get a sufficient supply. Being a larger volume of gas it therefore has not the same air-pull as the high pressure, and the result will be a reduced heat, thereby delaying work and a consequent high gas bill. The accompanying illustrations give a fair idea of the above reasoning.

We will first turn to Fig. 0. Note that the gas orifice is reduced, which is equal to having the gas cock partly closed.

"A" shows spud or needle point valve with gas entering burners with force. Having plenty of pressure behind it, it has no need of the valve being turned on unnecessarily full. This stream of gas gradually widens until it fills the diameter of the burner tube, and forces the air ahead, consequently drawing in more air to the burner through the air openings marked "B."

Now turn to Fig. 2, which gives a fair idea of a gas supply cut down when small piping is installed.

"B" shows very little air entering the tubes, consequently an imperfect mixture is made, resulting in imperfect combustion and low heating value. Conditions vary in many cases. The ideal way to help remedy gas troubles is to see that proper piping is installed in the first place. The friction in gas pipes grows greater as the pipe sizes are reduced, and, although one can possibly get all the gas required through it, yet the heating value will be reduced, and if it entails a longer period in which to do the work it necessarily follows that more gas will be used. The writer for some months used a gas range connected to ⅜ piping thirty-five feet long. The result was ample gas for the needs of the home, but no pressure. Consequently it took six minutes to boil water, where with the new piping of proper size, three minutes now does—a saving of fifty per cent. on gas bills.

Incandescent gas lighting is vastly improved by the addition of a trifle more pressure delivered at the burner. The difference in cost is so small between the different pipe sizes that it is hardly worth bothering about.

If every house in Toronto, or, in fact, in every town or city where gas is used, were to have the piping examined, all sags in pipe taken out ,and such rules followed out as were advised in the article which appeared in your Feb. 1st issue, the users of gas would at once find that a great saving of gas, as well as time, would result. Though you published a splendid table of pipe sizes, I am submitting a table herewith that would be very much more easily remembered by the average pipe fitter. I have no fault to find with the table whatever; it is, I believe, the most complete one I recall having read for some time:

Size of piping	Greatest length allowed	Greatest number of ⅜-in. openings
⅜ inch	20 feet	1 opening
½ inch	30 feet	2 openings
¾ inch	60 feet	10 openings
1 inch	70 feet	15 openings
1¼ inch	100 feet	25 openings
1½ inch	150 feet	50 openings
2 inch	200 feet	100 openings
2½ inch	250 feet	200 openings
3 inch	300 feet	350 openings

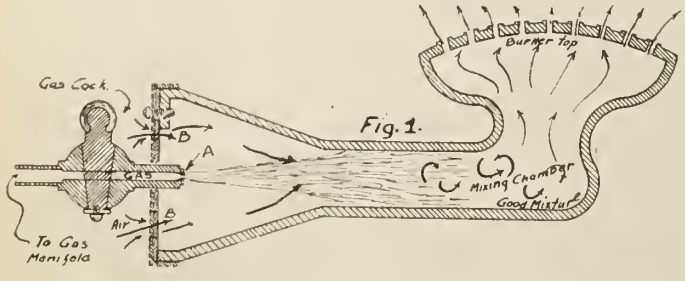
Rising main in no case to be less than ¾-inch.

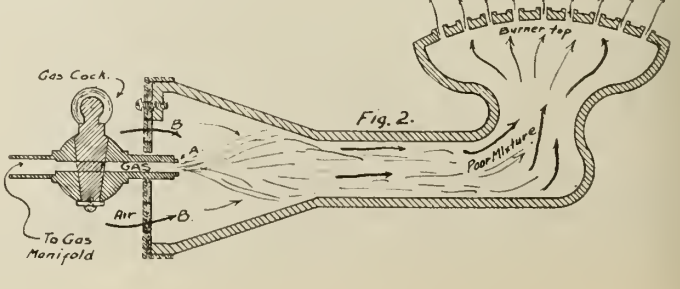
Pipe supplying stove in no case to be less than ¾-inch.

Pipe supplying gas grates must be ½-inch.

Outlets not to extend more than two inches beyond plaster.

One common cause of trouble is in allowing gas-fitters to place pipes of a size only sufficient for present requirements without any regard for future use whatever. Gas is fast coming to the fore as an illuminant, and for fuel purposes in the home as well as in large industrial plants, and ample allowance should be made for any additional appliances that may later be installed. Often it is required to make an upstairs sitting room in a home and if a mantel grate is required the usual practice is to connect it with the nearest gas main. The result is—trouble. After the pipe riser is installed (which, by the way, should be of a size to carry at least twenty-five per cent. of an overload), the main pipe line should be extended from front to rear of the building, all of one size, and off this to install individual branches to their respective outlets.





Annual Report of Winnipeg Plumbing and Drainage Department

Some Splendid Food For Thought—Many Items of Interest to Every Sanitary Engineer in Canada—The Report Proves the Importance and Necessity of a Plumbing Department For Every Town, Village or City

IN reading over this report one cannot fail to note how important such a department must be to the welfare of the citizens of Winnipeg.

We are all more or less liable to take so many things as a matter of course that we forget all the work, plans, ideas, and engineering skill that lay as it were behind the scenes of our daily life. Take for example one or two items mentioned in this report, the case where over 1,042 permits were granted to construct or reconstruct plumbing, out of which total 953 were for plumbing to be replaced. What would happen to the people of Winnipeg if such work was allowed to be done in any old slipshod way?

Another example, that of the inspecting of work being carried on in the usual way. Out of 5,337 tests and inspections made, 2,011 defects were discovered. Just imagine what that means. It means in most cases careless workmanship, poor material, unpractical constructions, and so on. Such conditions prove in themselves that defective work is being installed all over the Dominion. In fact if the members of the trade will look carefully over many of the catalogues issued they will see therein many fittings, many lines of goods that are totally unfit to be used in a practical plumbing installation. There must be an outlet for such goods or they would not be made.

In presenting this report to our readers we do so in the hope that it will be read because, as we stated in preceding paragraphs, there is an atmosphere of importance in almost every line of it.

PLUMBING INSPECTION DIVISION

Plumbing Permits and Inspections

During the year 1,042 permits were issued for constructing, reconstructing, adding to, or altering the plumbing and drainage systems in buildings throughout the city. The outstanding feature of the work done in this connection was that, of the 1,042 permits issued, 953 were for old buildings, where the plumbing was altered or added to, or required reconstructing. This condition will increase as time passes, and as the plumbing installed from 15 to 25 years ago becomes worn out, or obsolete, and therefore an increasing amount of time will require to be devoted to the reinspection of old work. A notable instance of this occurred this year in one of the largest hotels in the city, where the piping which had been installed about fourteen years ago was found to be so defective that it had to be entirely renewed at a cost of well over $50,000.

In the same period 5,337 tests and inspections were made, and 2,011 defects were discovered and rectified according to the following details:

TABLE I

TOTAL INSPECTIONS AND TESTS DURING 1918

Water Tests	Smoke Tests	Subsequent Inspections	Miscellaneous Inspections	Defects and Rectified	Total Inspect.
543	1,053	3,530	211	2,011	5,337

Certificates

The Winnipeg building by-law of 1913 provides that an occupancy permit for a building cannot be issued until the plumbing has been tested, inspected and certified. In conforming with this provision 23 certificates were issued to the building inspector. In addition, 106 certificates were issued to plumbing contractors for work done by them.

TABLE II

TOTAL PERMITS IN SEWER INSPECTION DIVISION FOR 1918

Permits Issued	Sewer Connections Constructed	Inspections
151	141	626

Sewer Inspection Division

Sewer connections are constructed under the supervision of this department, and sewer contractors working under a bond of $1,000 are permitted to make connections to the main sewers, except when the main sewer is not in the centre of the street. In such cases the city does the work and equalizes the cost, so that the owners of lots on each side of the street pay an equitable amount.

TABLE III

SEWER FLUSHING DEPARTMENT

Tank Flushing 256 Gallons Per Tank	Hose Flushing 125 Gallons Per Minute	Total
11,439,872	7,244,375	18,684,247

Fees

Permit and license fees amounting to $794.50 were collected.

Licenses

One hundred and twenty-four licenses were issued to master plumbers, 117 of these being renewals, for which a fee of $1 is charged, and 7 were for new licenses, the fee for these being $10 each.

Plumbing Installed by the City

In only one house was plumbing installed by the city, and the costs charged against the property as taxes. Undernoted is the location and cost of installation:

List No.	Location	Cost
51	783 Lorette Street	$249.50

CONTRAVENTION

Five prosecutions were instituted for contravention of the Plumbing By-Law, particulars of which are given below:

No. 1—Doing work without a license....	Fined $5.00 and costs, $7.35.
No. 2—Doing work without a license....	Convicted and reprimanded
No. 3—Doing work without a permit....	Fined $10.00 and costs, $12.35
No. 4—Doing work without a permit....	Fined costs, $2.35
No. 5—Doing work without a permit....	Fined costs, $2.35

Respectfully submitted,
(Signed) JAMES SMITH,
Plumbing and Sewer Inspector.

When a connection is to be made in a street paved with asphalt the owner is required to deposit with the city an amount sufficient to cover the cost of cutting and replacing asphalt.

Following is a monthly statement of permits issued, connections constructed, and inspections made during the year.

Licenses

Five licenses were issued to sewer contractors.

Fees

Permit and license fees to the amount of $83 were collected.

Sewer Maintenance Division

This division of the department attends to the repairing, flushing, and cleaning of the entire sewerage system of the city, comprising over 250 miles of main sewers.

Flushing

To flush the sewers, 684 underground tanks, with an average capacity of 256 gallons each are maintained and flushed regularly, and in addition there are one or two gangs constantly flushing with hose those sewers not flushed by tanks. The amount of water used for this purpose last year was 18,684,247 gallons, details of which are shown in the following statement:

Repairs

As in the past four or five years it has been noticed with growing concern that the necessity for repairing the concrete sewers is increasing rapidly, due to disintegration of the concrete, and this condition is not confined to any particular part of the city, nor is the disintegration confined to poured concrete as distinguished from pre-molded concrete, the latter being affected to almost as great an extent as the former.

Disintegration of concrete in sewers was first noticed on the Hart Avenue sewer about nine years ago, but was then considered to be due either to poor material or bad workmanship. This theory has been discarded, and it has now been definitely established that the trouble is due to alkali salts in the soil in combination with ground water. Most of the concrete sewers in the city are affected to a greater or lesser degree, and while it is comparatively easy to inspect and repair the larger sized sewers from 4 feet diameter upwards, as workmen can walk inside them, it is going to be a difficult matter examining and repairing sewers from 3 feet diameter to 2 feet diameter, as it is impossible for workmen to work inside them. At the present time there are several small-sized concrete sewers in precarious condition, which will require to be entirely reconstructed at an early date.

It is my intention to have a thorough survey made of the concrete sewers throughout the city early this coming spring, to ascertain their exact condition, when a detailed report will be made.

In addition to general repairs made to the sewers, catch basins, manholes and flush tanks, the following special work was done, particulars of which appear in Table 4.

During the period between January 2, 1918, to March 12, thirty-seven connections were frozen in different parts of the city, due to indrafts of cold air at manholes and catch basins, and thence passing up untrapped connections. This condition occurs only where house trap on the drain has been eliminated.

TABLE IV

MAIN SEWERS AND MANHOLES REPAIRED

Date	Location	Work Done	Remarks
May 17th	Pacific Ave. W. of McPhillips	Excavated and inserted 15 feet of steel casing	3′ 0″ sewer. Concrete disintegrated
May 29th	Flora Ave. 1st M.H. E. of McGregor	Rebuilt manhole	Concrete specials and rings disintegrated
June 11th	Wardlow Ave. W. of 1st M.H. W. of Clarke St.	New manhole built	
June 14th	Portage Ave. 1st M.H. W. of Burnell Street	Sewer excavated and repaired	3′ 0″ sewer. Concrete disintegrated
June 18th	McKenzie Street N. of College Ave.	Catch basin connection to main sewer dug out and repaired	Broken pipe
June 19th	Burnell Street N. of No. 567	Catch basin connection to main sewer dug out and repaired	Broken pipe
July 13th	Elgin Ave. N. of Tecumseh St.	Manhole rebuilt	Concrete specials and lower rings disintegrated
July 16th	Pacific Ave. Opposite No. 1561	Manhole rebuilt	Concrete specials and rings disintegrated
July 16th	Pacific Ave. N. of McPhillips St.	Excavated and inserted 15 feet of steel casing	3′ 0″ sewer. Concrete disintegrated
Oct. 1st	Broadway Ave. E. of Canora St.	Excavated and repaired sewer	18″ pipe sewer joint open
Oct. 7th	Cumberland Ave. W. of Carlton	Excavated to remove blockage in main sewer	
Oct. 22nd	Carruthers Ave., at Power St.	Manhole rebuilt	Concrete specials and lower rings disintegrated
Dec. 13th	Logan Ave., at Blake St.	Manhole rebuilt	Concrete specials disintegrated
Dec. 17th	Logan Ave. W. of Blake St.	Excavated and repaired sewer	2′ 0″ sewer. Concrete disintegrated
Dec. 27th	Newman Street S. of Portage Ave.	Manhole rebuilt	Concrete specials and rings disintegrated

TABLE V

FLUSH TANK REPAIRS

Date	Location	Work Done	Remarks
Apr. 13th	Owena Street, at Henry Ave.	Lead supply pipe repaired	
Apr. 16th	Dufferin Ave., at McGregor St.	Lead supply pipe repaired	
Apr. 18th	Craig Street S. of Portage Ave.	Lead supply pipe renewed	Old pipe destroyed by electrolysis
Apr. 23rd	Frances Street	Lead supply pipe repaired	
May 1st	Robinson Street N. of Stella Ave.	Lead supply pipe repaired	
May 3rd	Lydia Street No. of Notre Dame Ave.	Lead supply pipe repaired	
Oct. 15th	Furby Street S. of Notre Dame Ave.	Lead supply pipe repaired	

TABLE VI

SEWERS FROZEN

Main sewers at the following locations were frozen, due to indrafts at manholes and catch basins:

Date	Location
Jan. 6th	Hetherington Street and Nassau Street.
Jan. 10th	Rathgar Street at first catch basin west of Daly Street
Jan. 14th	Charles Street at first catch basin south of Inkster Avenue.
Jan. 18th	Mountain Avenue, at first manhole west of C.P.R. tracks.
Jan. 18th	Mountain Avenue, and first manhole west of C.P.R. tracks.
Jan. 25th	Sutherland Avenue and Stephen Street
Jan. 25th	Salter Street and Manitoba Avenue.
Jan. 26th	Salter Street and Boyd Street.
Jan. 26th	Salter Street and Mountain Street.
Jan. 29th	Arlington Street, opposite No. 1663.
Feb. 2nd	Clair Avenue at first catch basin west of Hay Street.
Feb. 5th	Beresford Avenue at first catch basin east of C.N. track.
Feb. 8th	Fleet Street and Nassau Street.
Feb. 22nd	Newton Avenue at first catch basin west of Roland Street.
Mar. 12th	Roy Avenue, opposite No. 1556.
Mar. 13th	Corydon Avenue and Wilton Street.

"Standard Sanitary" Reorganizes

Now Under the Direction and Management of An All Canadian Staff — Mr. Jas. A. Riordan Now President and General Managing Director—Outlook For the Concern Very Bright

A reorganization of the management and board of directors of the Standard Sanitary Co., Ltd., of Canada, will be of interest to the readers of the SANITARY ENGINEER.

Mr. James A. Riordan, who for the past ten years has been vice-president and general manager of the company, has succeeded Mr. Theodore Ahrens as president of the company and remains as general manager.

Mr. Riordan was born in Tipperary, Ireland, April 17, 1864, son of John and Mary (Carey) Riordan. Educated at public schools of West Bloomfield, N.Y. Began his business career as a clerk in the store of the Chicago branch of Sidney Sheppard & Company, tin plate and metal ware manufacturers, 1882-1883; travelled for that company out of Chicago, 1884-1886; began business as a manufacturers' agent in his own name in St. Louis, handling hardware and metal specialties, 1887-1896; sales manager for Dawes & Myler, sanitary ware manufacturers, New Brighton, Pa., 1896-1900; upon the formation of the present company (of which Dawes & Myler was a subsidiary company) Mr. Riordan was made manager at St. Louis and Western representative of the Standard Sanitary Manufacturing Company, 1900; came to Canada and opened up the Canadian business, 1910, of which he became vice-president and general manager. Member of the Canadian Manufacturers' Association and was chairman, Transportation Committee, 1916-1917, and is still a member of the Toronto Board of Trade.

Mr. Riordan is well known personally to the trade from the Atlantic to the Pacific, and this announcement will be received with pleasure by his many friends.

JNO. A. RIORDAN
Elected President and General Manager

Mr. Hugh S. Wallace, who succeeds Mr. Riordan in the office of vice-president, has also been elected one of the directors of the company. Mr. Wallace's connection with the company began in 1910, when he disposed of his business to this company, remaining as manager of the Hamilton branch until 1915, when he assumed the managership of the Toronto jobbing house. Mr. Wallace is one of the trade's old stand-bys, having now been directly connected with the industry upwards of thirty-five years, and is one of the best known men in and around Ontario. His many friends in the trade throughout Ontario will congratulate him on his preferment.

Mr. C. F. Rogers, manager of the company's Hamilton jobbing house, has been elected one of the directors. Mr. Rogers' connection with the company also dates from the year 1910, at which time he entered the company's service as traveller for the Hamilton branch, succeeding to the managership in 1915, when Mr. Wallace moved to Toronto.

Mr. Rogers is on old London boy and is a nephew of Mr. T. A. Stevens, of the Empire Manufacturing Company, London. Throughout Southern Ontario, from Niagara Falls to Windsor, twenty years constantly meeting with members of the trade has built for Mr. Rogers many good friends. In fact everybody knows "Charlie" and will wish him all kinds of success.

HUGH S. WALLACE
Elected Vice-President and Sales Manager, Toronto

STEAM BOILER REGULATION AND CONTROL

A vital factor in the economical operation of steam boiler installations is the proper regulation of the damper to suit the furnace and load conditions. Firemen are usually neglectful of damper control, often because of its inconvenient position and the clumsy provision made for handling it. The damper can be used to advantage when the boilers are banked, to keep cold air from passing through the setting, to maintain a nucleus of incandescent fuel to aid in starting up the boilers, and to reduce the amount of coal required to raise the steam pressure.

In order to secure proper manipulation of the damper, a simple and easily operated means of control should be provided, so situated that a draught gauge is in plain view to guide the fireman in the operation of the damper.

The installation and use of the underfeed stoker does not minimize the importance of proper damper regulation.

In boilers fired by natural gas, automatic control of the damper gives very good results. The control can be connected to the burners so that the boiler damper is closed tight and the gas shut off from the burners when the steam pressure gets above the normal. Thus the exactly correct mixture for the most effective combustion can be originally obtained, and when the damper regulator has been correctly set afterwards always maintained by the automatic control.

C. F. ROGERS
Director and Sales Manager Hamilton Branch

Market Conditions and Tendencies

Statements Regarding Supplies and Trend of Prices

THE MARKETS AT A GLANCE

PRICES on plate have undergone a further revision downward in some quarters this week, and the heavy gauges of black sheets have also narrowed towards the lowest basis. Supplies are now very good in these lines, and the same is true of galvanized sheets, on which business is being keenly developed.

Ingot metals have again come in for some revision, perhaps the greatest change being that in copper, which is down in sympathy with declines recorded in the United States markets. The abundance of scrap is retarding the sale of this metal. Tin is quite active, stocks light, and a lower basis has been reached. Lead is weak, and spelter has declined another ½c per pound.

Solder has registered another slight decline, amounting to about 1c per pound. Manufactured lead products are held without change, and the same is true of range boilers and enamelware, no features of particular interest attaching to these at the present moment.

Boiler tube orders for later delivery are being accepted by some jobbers, the prices named on these being about 10 per cent. below quotations for spot stocks. There has been a very fair movement of tubes to the trade, and supplies are within rather narrow compass.

Cotton waste has undergone a revision to lower levels, prices being down from 1c to 2c per pound, according to grade.

TORONTO, February 13.—Lower prices on steel plate have been named and heavy black sheets are also lower in some quarters. Cotton waste has declined from 1c to 2c per pound according to grade. Solder is slightly easier and some metals have sagged, copper, tin and spelter being among the lines to reach lower levels. Some uncertainty exists as to future trend on some lines but trade seems to be getting down to a very fair basis with production costs on many classes of goods.

Range Boilers Record No Change

RANGE BOILERS.—No new developments are yet to be noted in respect to range boilers. There is little business offering at the present time, and this is being met from ample stocks. Prices to-day follow:

	Standard	Extra Heavy
30-gallon range boilers	$14.00	$17.00
35-gallon	17.00	20.50
40-gallon	20.50	24.00
52-gallon	28.00	32.00
66-gallon	37.00	42.00
82-gallon	45.00	50.00
100-gallon	62.00	70.00

Enamelware Holding at Steady Basis

ENAMELWARE.—The basis is a steady one and no particular feature of interest is yet noted in the markets on enamelware. Business is within rather a narrow compass but this is not unusual at this time of the year. Prices on some of the standard lines are given herewith:

Bath-tubs, roll rim, 4, 4½, 5 feet, 24 to 30 in. wide	$32 10
Bath-tubs, 5½ ft.	35 70
Basins, flat back, 14 x 15 in.	6 00
Do., corner, 15 in.	5 95
Sinks, roll rim, 18 x 30 in.	15 05
Closets, oak tank and seat	27 00
Do., enamel iron or white vitro tank	29 00

Unions Easier; Soil Pipe Unchanged

SOIL PIPE, FITTINGS.—A decline in the price of Dart unions has been made this week, ¼ to 2 inch now being quoted at a discount of 20 per cent., and 2½ inch and larger, 12 per cent. from list; these supersede discounts of 15 per cent. and 6½ per cent. respectively. Other pipe fittings are unchanged. Soil pipe and fittings record no change this week. Buying is within a narrow compass and conditions at the moment just a little uncertain. Range of quotations follows:

SOIL PIPE AND FITTINGS

Medium and extra heavy soil pipe, 2 in. to 6 in.	15%
Medium and extra heavy fittings, 2 in. to 6 in.	25%
8 in. soil pipe and fittings	Net list

C. I. PIPE FITTINGS

Cast iron fittings	12½%
Plugs	22%
Bushings	28%
Unions, standard	35%
Dart unions, ¼-inch to 2-inch	20%
Do., 2½-inch and larger	12%
Nipples, up to 4-inch	45%
Do., 4½-inch and larger	40%
Do., running thread 4-in. and under	25%
Couplings, 4-in. and under	35%
Do., 4½ in. and larger	15%

MALLEABLE FITTINGS

Globe, angle and check valves, standard, medium pressure	10
Radiator valves, standard med. pressure.	30
Radiator valves, removable seat, medium pressure	25

Cotton Waste Declines; Oakum Unchanged

COTTON WASTE.—In line with information given out in SANITARY ENGINEER last issue, prices on cotton waste have been revised downward in

some quarters, the declines ranging from 1c to 2c according to grade and type. On the new basis of quoting these figures rule on white waste: XXX Extra, 19½c per pound; XX (replacing X Grand), 18¼c; XLCR, 17c; X Empire, 15½c; X Press, 14c. Colored Waste: Fancy, 15½c per pound; Lion, 14c; Standard, 12½c; Popular, 11c; Keen, 9½c; Cream polishing, 21½c per pound. Oakum rules without any change and only a fair amount of business being offered.

	Per 100 lbs.
Best American	$21 00-$22 00
Clipper, spun	21 00
Do., unspun	10 50
Plumbers', spun	10 00- 10 50

Wrought Pipe Remains Unchanged

WROUGHT PIPE.—Wrought pipe is ruling at steady figures and some business is being done. Stocks generally are low, dealers exercising care in buying but deliveries are satisfactory. Prices appear in panel herewith:

WROUGHT PIPE
Price List No. 38—January 6, 1919.

	Standard Buttweld Steel Blk.	Steel Gal.	Gen. Wrot. Iron Blk.	Gen. Wrot. Iron Gal.

Terms, 2% 30 days, approved credit.
Freight equalized on Chatham, Guelph, Hamilton, London, Montreal, Toronto, Welland.

Boiler Tubes Moving; Stocks Low

BOILER TUBES.—A fair amount of business is being done in boiler tubes and stocks are at a comparatively low ebb. The tube situation just now is one that comes under the two-price heading. This is not true in all cases, but in several it is. The warehouses have stocks in some cases that were taken in at war prices when help was scarce and costs very high. They have not enough of this to make them stampede the market and they are able to get new stock at the lower prices, but it takes time. Buyers of tubes if they watch their needs ahead can save a little money here. If they can so arrange matters that they can wait for a couple of weeks for delivery they can buy tubes at ten per cent. below the price if they want them taken out of the stock that warehouses have on hand. There seems to be a tendency on the part of the Canadian trade in nearly every case to give the buyer the advantage as soon as it it possible to do so.

BOILER TUBES—	Per 100 feet Seamless	Lapweld
1 inch	$32 00	$.....
1¼ inch	36 00	.....
1½ inch	39 00	32 00
1¾ inch	39 00	32 00
2 inch	45 00	32 00
2¼ inch	48 00	34 00
2½ inch	50 00	40 50
3 inch	58 00	45 00
3¼ inch	.....	52 00
3½ inch	70 00	54 00
4 inch	80 00	67 00

Some Revisions in Plates; Fair Orders

SHEETS, PLATES.—There have been some slight revisions in the prices of plate to lower levels. Other lines of sheets remain unchanged at figures given below and jobbers report a fair amount of business coming to hand, and quite an inquiry which is expected to develop into orders in due course. Stocks are very good and outlook considered satisfactory.

BLACK SHEETS—	Per 100 lbs.	
10 gauge	$6 50	$6 90
12 gauge	6 05-6 60	7 00
14 gauge	6 10	6 65
16 gauge	6 20	6 75
18-20 gauge	6 80	7 30
22-24 gauge	6 85	7 35
26 gauge	6 90	7 40
28 gauge	7 00	7 50
3-16 inch plate	6 25	6 75
¼-inch boiler plate	6 00	6 50

Prices shown are for full cases. An extra charge of from 25c per 100 lbs. is made for less than case lots.

GALVANIZED SHEETS—		
10¾ oz.	8 50	$9 00
U.S. 28	8 20	8 75
U.S. 26	7 90	8 45
22 and 24	7 75	8 30
18 and 20	7 60	8 30
16	7 45	8 00

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

Some Slight — Change in Solder

LEAD AND ZINC PRODUCTS.—Some slight changes are reported in prices on guaranteed and strictly solder, quotations being down about 1c per pound. Wire solder is quoted up to 50c in some quarters. No change has been made in manufactured lead products, pipe and traps and bends holding at figures below:

Lead pipe, lb.	....	$0 13
Lead waste pipe, lb.	....	0 14
Lead traps and bends	....	Net list
Lead wool, lb.	..	0 14
Lead sheets, 4 to 6 lbs., sq. ft., in rolls, lb.	0 11	0 12½

Cut sheets ½ to ¾c lb. extra and cut sheets to size, 1c lb. extra.

Solder, guaranteed, lb.	$0 37	$0 39
Solder, strictly, lb.	0 33	0 37
Solder, commercial, lb.	0 31	0 36
Solder, wiping, lb.	0 30	0 32½
Solder, wire, lb.	0 45½	0 50
Zinc sheets, per lb.	....	0 20

Old Materials May Go Lower

OLD MATERIALS.—The scrap metal market remains dull. In fact, "stagnant" is a better word. There are no deals put through, and the chances are that the claims made by the dealers that they are losing money on present operations are quite correct. Dealers are not anxious to buy even at the present battered down list. They fear further drops in prices, and, as a matter of fact indicate that lower prices may be reached, and do not care to get caught in a declining market, especially when there is no urgency in the situation to force them to buy.

Dealers' Buying Prices—		
Tea lead	...	0 03½
Heavy lead pipe	0 04	0 04½
Pipe scrap	14 00	15 00
Stove plate, per ton	14 00	15 00
No. 2 busheling	8 00	9 00
Old rubbers, boots and shoes	0 07½	0 07¾
Overshoes, lumbermen's rubber boots	....	0 05½
Bicycle tires	0 02½	0 03½
Automobile tires	0 03½	0 04
Yellow brass	0 08	0 08½
Red brass	0 14	0 15
Light brass	....	0 06
Scrap zinc	0 05	0 05½
Heavy copper	0 16½	0 17½
Wrought iron, No. 1, per gr. ton	18 00	19 00
No. 1 machinery cast	24 00	26 00
Heavy melting steel	....	13 00

Copper Lower; Tin, Spelter Too

INGOT METALS.—Lower prices on copper and spelter have been recorded this week. There is a fair amount of activity noted in tin and stocks, though not heavy, are ample to meet the demand.

COPPER.—The substantial declines recorded in the United States market on copper have been reflected here and quotations to-day range around 21c to 22c per pound. There is only a fair amount of business being done in the metal here, the heavy stock of scrap being a factor to retard the sale of the metal.

TIN.—A somewhat lower basis has been determined upon in tin, quotations ranging from 60c to 65c per pound. There is a fair amount of activity and stock is considered ample to take care of the immediate demand.

SPELTER.—It is indicated that there is very little spelter on spot. However, there is not a great deal of interest being shown in this metal and prices have sagged half a cent a pound to 8½c.

LEAD.—Dullness marks the position of the metal this week. There are only small lots moving and stocks are quite ample to meet even very much heavier demands. Quotations are unchanged for the week at around 6¾ to 7c per pound.

ALUMINUM.—There is nothing new to report in this metal, commercial interests still very largeely keeping out of the market. Nominally quotations range around 50c per pound.

ANTIMONY.—There have been no particularly interesting features develop in regard to this metal this week. Sales are light and stocks are comparatively heavy. The price holds at 8½c per pound.

TAKEN OVER BUSINESS

For upward of five years Messrs. Kennedy & Desroche, of Penetang, Ont., have conducted a nice plumbing and heating business. Mr. J. E. Desroche has taken over the business now, and Mr. Kennedy expects to establish a hardware business in Western Ontario. He has not given out his full plans for the future as yet.

SOLD BUSINESS TO STAFF

W. McGee, plumber and tinsmith, Belleville, has sold out his business to two of his employees, Messrs. Diamond & Hyde; the former acted as sales clerk, the latter as bookkeeper. Mr. McGee has been in business for about 30 years, was a practical man, good mechanic and well liked by a large number of friends. The new owners, too, have earned the respect of quite a number of people, are attentive to business, and from reports, the young men have a bright and prosperous future before them.

TORONTO VISITOR

Mr. Russell Wright, the secretary-treasurer of Messrs. Noble & Rich, sanitary and heating engineers, was a visitor in Toronto last week. Mr. Wright is a great booster for technical education. He and a friend, one of the staff, visited the Toronto Technical School and was very pleased with what he saw. He is also interested in no small degree in the apprentice problem.

SPLENDID TRIBUTE TO A PLUMBER

Saskatoon was the home of the late Sgt. Hugh Cairns, that is, the home of the flesh. But his soul, his spirit, belonged to his motherland, England. And for her he laid down his body and paid the supreme sacrifice. Oh, that mother call, 'tis sweet, and when the war broke out 'twas earnest, and it was heard; yea, heard from the uttermost part of the earth.

Many have wondered how England could draw forth her sons so. But she did, and did it quick. Britannia mourns her heroes now at rest in the flesh, but she is proud of that spirit which lives in the millions left and yet unborn.

Sgt. Hugh Cairns, D.C.M., V.C., a lad of 21 summers, was born in 1897, and made his home in Saskatoon about 7 years ago, learned the plumbing trade and was just about to take his final examination for entrance on the roll of licensed plumbers when he felt the call from "over there" and joined up. He served his time with the Northern Plumbing Co., Saskatoon, under the late Fred Halpenny, whose death was reported in a recent issue of SANITARY ENGINEER.

The accompanying poem was written by one of his friends and reflects great credit both to the author and the hero. No grander sentiments could be expressed:

CHANGE OF ADDRESS

Walter Hill, sanitary engineer, Toronto, has moved from 1231 Dundas Street West to 788 College Street. Mr. Hill hails from England and knows his business from A to Z, having learned his trade in the Old Country. He is a subscriber to Sanitary Engineer and believes in executing work in a practical manner. Many strange installations have been related to SANITARY ENGINEER that do not by any means reflect credit to the trade as a whole.

TO SERGEANT HUGH CAIRNS, D.C.M., V.C.

(A Tribute From a Friend)

Where brooding winds the haggard branches wave,
A little group of wooden crosses stand;
And one there is among them, I would crave
The honor but to touch, with "Friendship's" hand.
Sorrow is tearless, when the happy dead
Can still unfold sweet mem'ries from the tomb;
To ope like flowers, and fragrant virtues shed
Into the hearts, their passing fraught with gloom.
And, so it is with thee, no tears could rise
To dull the gleam of "Love" and "Honest" pride;
For I have known thee, looked into thine eyes,
And felt the "Friendship" thou to none denied.
If ought I feel, 'tis envy of thy death,
To hold "Life's" cup filled with the "Victor's" wine,
To know its subtle lure, yet in a breath
To fling it down unquaffed, at "Freedom's" shrine.
But thou wert England's, and the sea-girt land
That cradled thee, had wrought into thy soul
The sternness of the cliffs that guard her strand,
The faith and strength that "Death" could ne'er control.
Thou hadst much to live for—yet "Honor," "Fame,"
Were laid aside as naught, as things too frail
To bind thy soul when "Duty" called thy name;
Thus, "Britain" lives, and "Freedom" could not fail.
No voice of human praise, no song elate,
May find thine ear in thy unsearched retreat;
Yet "Friendship's" heart, from "Earth's" dark prison gate,
This token gives, in language all unmeet.

FRED. H. BAILEY.

SMOOTH-ON BOOK

The Smooth-On Manufacturing Co. Newark, N.J., are distributing to the trade a very useful instruction book describing the various kinds of repairs that can be effected by the use of their product, as well as making regular joints in pipes, etc. It is pocket size and contains nearly 150 pages of valuable information. A postal card to above address will procure a copy of this book.

LETTER FROM SASKATOON

Editor SANITARY ENGINEER: You, no doubt, will be interested to receive a few lines about some of the boys who went "over the top" from Saskatoon, and have some of them returned, as well as those who have paid the supreme sacrifice.

Our city trouble man, Dick Streak, was away 3 years and 9 months, and was wounded and invalided home, arriving at the end of last year. We are glad to have him on duty again at his old job. Everybody likes Dick, he is true as steel and well liked by most of the old guard of plumbers that were working here in the first half of this decade He comes of a family of plumbers in London, England, his father being in business for many years. He has lost two or three of his brothers in the war.

There has also been a number of other plumbers returned to us recently. Alex. Ritchie, Sergt. E. J. O'Reilly, locally known as "Ted Riley," were both wounded in the fighting last April with the Strathcona's Horse; whilst Ed. Cairns, Chas. Miller, Alf. Clark and W. W. Smith left their bones in France.

I am glad to learn the Government has decided to let our boys come home; some of them have been "over there" since soon after war was declared. Bob Taylor, brother to our plumbing inspector,

is still away, having gone over with the original Princess Pats.

During the flu epidemic there was one splendid worker who volunteered to help stamp out the "flu." I refer to Ab. Brown, the representative of the Dominion Radiator Co. in this district. He was a very active worker, and the boys were sorry to see that he afterwards became afflicted with the disease. He is recovering slowly, but does not seem very robust yet.

I will keep you posted on local news from time to time.

HORACE NIXON.

REMOVING IRON RUST FROM CONCRETE

A solution of hydrochloric acid and stannous acid will remove iron rust from concrete, and will not injure the concrete if the treatment is administered rapidly and the face immediately washed with clean water. The solution mentioned has an affinity for carbonate of lime, consequently it should not be used where hydrated lime has been incorporated in the mixture. Rough finished cement stucco should be treated by spraying with the above solution, as the result will be more thorough and the work more rapid than by the use of a brush. —M. M.

C. A. DUNHAM COMPANY'S ANNUAL CONFERENCE

The C. A. Dunham Company, Limited, whose organization has grown considerably during the period of the war in spite of diminished building activity, held a sales conference during the past week at the Head Office, Toronto, where the company's plans for this year were disclosed.

The manager of each branch sales office was present from Halifax, Ottawa, Toronto, Winnipeg, Calgary and Vancouver.

The company is preparing to extend their plant this spring to meet the increased demands for their specialties.

Wave of Optimism For Canada's Future

Canada Metal Company's Seventh Annual Sales Convention—President Looks For Big Development in Canada

ON Monday, January 20, the seventh annual convention of the Canada Metal Co., Ltd., was opened and a sale-staff of thirty were congregated round the board when Mr. Harris, Sr., president of the company, welcomed the staff to the convention.

Referring to business of the past year, Mr. Harris stated that it was remarkable," and yet there is no reason why 1919 should not be greater in its trade expansion, not only for our own firm, but for every Canadian manufacturer who will determine to go after the business and take advantage of opportunities presented."

Continuing, Mr. Harris stated, "one of our leading financial houses recently sent out a circular broadcast which expresses my sentiments exactly, for I am a firm believer in Canada and its future." The reasons given for expecting a period of exceptional prosperity in the Dominion were as follows:

"The stage is set in Canada for a period of development, the like of which has never been known in the history of the Dominion. The nation is building ships that will carry Canadian products to every country in the world. The steel industries are being equipped on a scale that should, before long, make Canada independent of imported supplies. The big consuming markets are becoming more dependent each year on Canada for pulp and paper supplies, and this country is, physically, in a position to provide for the world's requirements indefinitely."

Mr. Harris, Jr., vice-president, presided, and in going over the annual report of sales of each salesman, said that it was most gratifying to see the progress made in 1918.

In 1917 the company's sales established a record, but 1918 was far ahead. Not only had the branches made considerable progress, but large business had been done with Australia, New Zealand, South Africa, and other distant parts of the British Colonies.

"Our convention," Mr. Harris, Jr., continued, "will be devoted to going thoroughly into our various lines, so that salesmen can gain a greater knowledge of the goods they are selling."

Prizes Presented

The presentation of the prizes was very interesting, and Mr. Martin, in Toronto, when he received his cheque for the first prize in general sales, was like Niobe—all smiles. Mr. White, of Winnipeg, made a good second. Mr. Parkin was the one to put the Ham in Hamilton and received a beautiful diamond ring for the first prize in the Harris heavy pressure babbitt metal competition.

In this competition, Mr. Hughes, Toronto, was second.

Salesmen had been encouraged to send in questions to be answered in reference to all metals, or anything associated with the metal industry, and one morning was devoted to taking up such questions.

At noon each day, lunch was served at the Humber Bay Inn, and the trip along the lake shore made a most enjoyable break in the proceedings. Monday evening there was a smoking concert in the convention hall.

At the conclusion of the convention, a hearty vote of thanks was accorded to Mr. Harris, Sr., Mr. Harris, Jr., and Mr. H. C. Crow, for the excellent way in which everything had been prepared and carried out, and in reply Mr. Crow stated that he hoped that each salesman had gained a little more knowledge of the goods manufactured by the company and that they would be able to assist everyone interested in the metal business with any difficulty which might arise, and that the motto for each one be: "We will be satisfied with nothing short of perfection."

MEMBERS IN ATTENDANCE AT DURHAM CONFERENCE

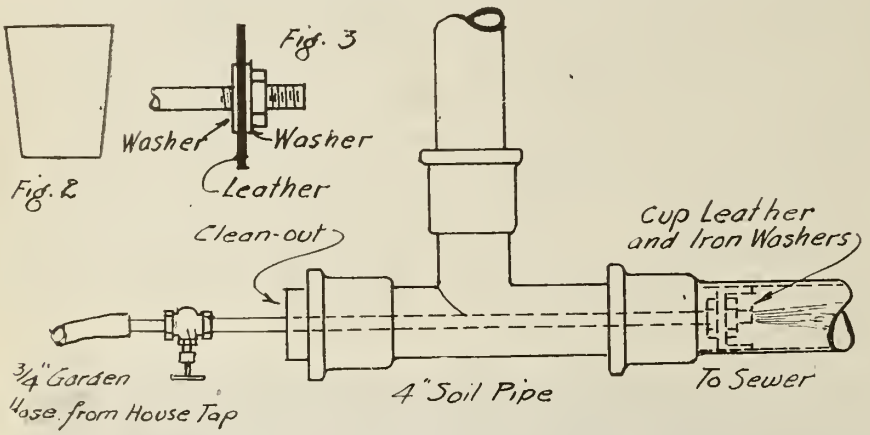
Top Row—Left to Right: R. F. Eagar, Halifax; E. T. Flanagan, Toronto; A. Kastello, Montreal; W. H. Baldwin, Toronto; J. R. Estey, Calgary. Bottom Row: J. H. Shaver, Ottawa; A. J. Dickey, Gen. Manager; J. Sully, Jr. Asst. Sales Mgr.; M. W. Shears, Asst. Engineer.

Subscribers Are Urged to Send in Questions to be Answered, or to Comment on Letters Published--Description of Jobs Done or Shop Kinks Are Also Invited.

CLEANING SEWER

By J. E. NOBLE

A few days ago I was watching a plumber trying to clear an obstruction from a 4-inch sewer pipe. His method was to run the end of a hose into the end tee, after removing the clean-out cover, and plugging rags or clothes around the hose to prevent the water backing out. Why will men use such crude methods when a few minutes' work will supply them with a really good tool for this style of a job? An idea of the tool can be formed by a glance at the sketch; I used this tool with fine success when I worked at the plumbing business as long as twenty years ago (perhaps I should use modern terms and call it sanitary engineering, but from personal observation the old plumber is "in it" to the neck with the sanitary engineer, in numerous cases at least). It is nothing more or less than a cup leather held on the end of a piece of ¾-inch iron pipe by two iron threaded washers, the other end of the pipe being attached to a hose, which in turn is coupled to one of the house taps. A valve can be placed on the end of the pipe so that the flow of the water can be controlled without going to the other tap. To make cup leathers, form a piece of sheet tin or galvanized iron in the form shown at Fig. 2, size on top 6½ inches, bottom 4 inches; this will do for cup leathers 6 in. to 4 in. To make the cup, cut the leather 2 in. over the size required; that is, for a 4 in. cup make the leather size 6 in. Now place the leather between two iron washers and bolt them together as in Fig. 3. Next, place it in a dish of warm (not hot) water for a few minutes, this will soften up the leather. Next remove from the water and force down into the form, Fig. 2, and leave there for half an hour or so until the leather gets time to set into shape. This makes as good a cup leather as can be bought. Of course judgment must be used in picking your leather; use a piece of firm, flexible leather, sole leather is too hard, and belly leather too soft; use side leather.



ARRANGEMENT USED IN CLEANING OUT OBSTRUCTED SEWER.

GETTING A REAL DRAFT

A good draft is one of the most essential things about a boiler plant, and special attention should therefore be paid to it when the plant is laid out. It is easy to cut the draft down if it is too strong, but if it is too feeble the owner of the boiler is faced by a serious situation. The value of a powerful draft is particularly appreciated when some emergency makes it necessary to force the boilers beyond their normal capacity for a time. A strong draft also makes it feasible to burn relatively cheap and low grade fuels.

RADIATOR PROBLEM

I HAVE been asked to change over a hot water job to steam. The hot water systems are installed in five houses at present, all are detached, with about 6 feet space between each house. And the furnaces are all too small. Can I use the same pipes? The owner has been advised to make one central heating steam plant, but has been told that while it may be possible to use some of the piping, the returns would all have to be taken out and the flow pipe connected at the top of the radiator. It seems to me that this is going to be a very expensive job,and if you can suggest a less expensive way, or overcome having to disturb the radiation and the piping, the owner would I believe, be much better impressed. He is of the opinion that he can rent the houses for more money if he furnishes heat and has a man around to clear up a little round the buildings, and further he has a man from the war who can just look after this equipment; and is quite willing to build a separate central heating plant. Any advice on the problem will greatly oblige.

CENTRAL HEATING.

It would have been much more interesting if "Central Heating" had sent in a rough sketch of the work under consideration, but in the absence of such sketch we will advise as best we can. In the first place, had the job been in the first place a number of steam installations, we would have advised a central source of steam service, by taking all the small furnaces out and erecting a large central plant. But as it is a hot water proposition, and the owner would like to have the houses left undisturbed as much as possible, we would advise as follows:

First, take out all the small furnaces and install in their place a type of steam hot water heater such as the "Sims," the "Manny," the "Patterson," the "Alberger," or the "Ross."

Next connect these up to the new

MUELLER

Compression Sink Bibbs

SIMPLE elegance, combined with superior strength and wearing quality, is what you give your customer when you install **MUELLER** goods.

The many advantageous features of **MUELLER** compression bibbs give maximum service from the bibb as a whole. The anti-spreading device that breaks up the whirling motion of the water and the corrugated stem and handle, allowing the handle to be set at any angle without becoming loose or wobbly, are only two of these features.

MUELLER Bibbs are the best the market affords. Write for prices.

THE QUESTION BOX

Continued from page 28

steam central heating plant. Each main steam supply as it enters each building should be fitted up with a thermostatic temperature controlling valve, so each house would be under proper control, and the temperature in the house kept at a uniform heat. Tons and tons of coal, or whatever fuel is used, would be saved. If oil, of course, it would be gallons, not tons.

There need be no alterations made to the system of hot water pipes, nor would the radiation require to be disturbed. It would, however, be a very good thing to place a temperature booster or heat generator on each job, so as to be able to assist the water in the system to absorb all the steam units furnished.

There is another question which would have to be considered, that of being sure that a head of steam of sufficient pressure would need to be maintained so as to make sure of the already fixed quantity of hot water radiation would be enough to heat the houses. If our inquirer will send in a sketch of the proposed job, we will be pleased to render any service we can. In conclusion we may say that we would not advise turning the actual radiation and piping already installed into a straight steam job, neither separately or centrally.—Editor.

Trouble with Rust in Water

Editor Sanitary Engineer.—I have installed a number of pneumatic water systems and until just lately I have had no complaints. One job was not so bad, but I tried to remedy matters by pumping some pipe cleaning compound through the pipes and tank and then running all the water off. This job is worse than ever now, in fact, the scale in the pipes is now causing trouble with the valves in the pump. Can you suggest a remedy? Another job I am having trouble with, the water appears to be a slight greyish color, red at times only. I dare not touch this job for fear of making matters worse. The peculiar thing about these jobs is that they are the only ones I am as yet having trouble with. For example, I installed a couple of jobs over 12 years ago and they are working fine. The people say that they are working and giving better service than they did when first installed. Any information will be appreciated.

PUMP TROUBLE.

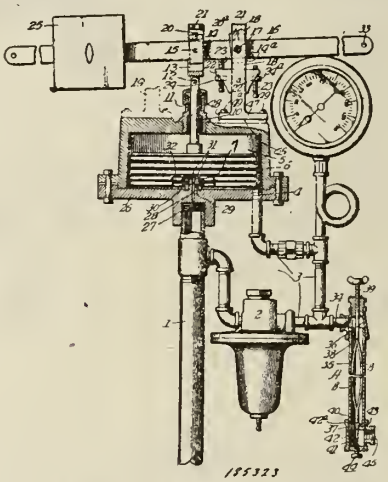
If our correspondent will send in his name and furnish more information regarding kind of well or source of water, whether water is charged with lime or vegetable matter, we will be able to give some decision as to the cause of trouble. It may be that the suction pipes are black, and galvanized wrought iron pipe should be used. Further, there may be some foreign matter percolating into the source of water supply. One thing we would strongly advise and that is that samples of the water be sent to the provincial health department to be analyzed. —Editor.

CANADIAN PATENTS

No. 185,323

The National Regulator Company, assignee of John M. Larsen, both of Chicago, Illinois, U.S.A., 2nd July, 1918; 6 years. Filed 5th June, 1916. Receipt No. 266,302.

Claim.—1. In a device of the class described, an operating lever, a source of pressure adapted to actuate same, a diaphragm casing, a plurality of diaphragms within said casing, a stem mounted on said diaphragms and connected with said lever, means for admitting pressure within said diaphragms, means for admitting pressure within said diaphragm casing outside of said diaphragm, a reducing valve interposed between said source of pressure and the diaphragms casing, and means for relieving the pressure within said diaphragm casing outside of said diaphragms, and a reducing valve interposed between said source of pressure and the diaphragm casing.



No. 185,323. Pressure Regulator.

2. In a device of the class described, an operating lever, a source of pressure adapted to actuate same, a diaphragm casing, a plurality of diaphragms within diaphragms, means for admitting pressphragms and connected with said lever, a shiftable fulcrum for said lever mounted on said diaphragm casing, means for admitting pressure within said diaphragm casing.

3. In a device of the class described, an operating lever, a source of pressure adapted to actuate same, a diaphragm casing, a plurality of diaphragms within said casing, a stem mounted on said diaphragms and connected with said lever, a shiftable fulcrum for said lever mounted on said diaphragm casing, means for admitting pressure within said diaphragms, means for admitting pressure within said diaphragm casing outside of said diaphragms, a reducing valve interposed between said source of pressure and the diaphragm casing, and means for relieving the pressure within said diaphragm casing.

4. In device of the class described, an operating lever, a source of pressure adapted to actuate same, a diaphragm casing, a plurality of diaphragms within said casing, a stem mounted on said diaphragms and connected with said lever. a shiftable fulcrum for said lever mounted on said diaphragm casing, a plurality of stops mounted on said fulcrum whereby the upward and downward movement of said lever in either direction may be regulated, means for admitting pressure within said diaphragm casing outside of said diaphragms, and a reducing valve interposed between said source of pressure and the diaphragm casing.

5. In a device of the class described, an operating lever, a source of pressure adapted to actuate same, a diaphragm casing, a plurality of diaphragms within said casing. a stem mounted on said diaphragm and connected with said lever, a shiftable fulcrum for said lever mounted on said diaphragm casing, a plurality of manually adjustable stops mounted on said fulcrum whereby the upward and downward movement of said lever in either direction may be regulated, means for admitting pressure within said diaphragm casing outside of said diaphragm, and a reducing valve interposed between said source of pressure and the diaphragm casing.

6. In a device of the class described an operating lever, a source of pressure adapted to actuate same, a diaphragm casing, a plurality of diaphragms within said casing, a stem mounted on said diaphragms and connected with said lever

THE "MORRISON" AUTOMATIC CELLAR DRAINER

For ease of operation and simplicity of construction this cellar drainer has no equal.

Easy to install.
Takes up little space.
All working parts above water.
Dirt does not get into moving parts.

All troubles vanish after a "Morrison" has been installed.

Goods in basement storage are safe from damage.
Building foundations are protected.

Fifty years' experience in the manufacture of Plumbing and Heating supplies is back of the "Morrison." May we show you how to increase sales and earn splendid profits by selling them?

Write us to-day.

The James Morrison Brass Manufacturing Company, Limited
93-97 Adelaide St. West, Toronto, Ont.

A Syphon Is The Heart Of a Sanitary Septic Tank— *Anthes Syphons Are Faultless!*

Regular and intermittent discharge in connection with the sewage system is absolutely necessary or the system installed is a failure.

Anthes Syphons and Soil pipes have no superior for permanence, quality and price.

Anthes Syphons are unconditionally guaranteed. We manufacture a full line of cast iron pipe fittings at both our plants.

Ask your jobber for "Anthes" Syphons, soil pipe and fittings.

The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH

Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with wood handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

Nut with Nut-Guards

PIPE AND THE PUBLIC WELFARE

By R. C. McWANE

A Book Just Off the Press

Every sanitary engineer should be the possessor of this book. It deals with pipe-making of all kinds, cast iron, wrought iron, steel, wood and tile pipe. It is valuable because it gives the users of pipe a true idea of how pipe lasts under various conditions when in service.

Price $1.00 Postpaid

This is a "Q" Foot Valve

And it Just *CAN'T* Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

R. MACDOUGALL CO., LTD.

GALT., CANADA

M. & T. COILS

EXTENDED SURFACE

We make a specialty of our coils. They are designed to create more active circulation than any other on the market. Liberal in size of interior and will heat water quicker than the ordinary line of coils.

CAUTION !

This is a personal message to you. Kindly read every word—you owe it to yourself to do so.

THE thing every steamfitter prizes most highly is his reputation. Without it his standing with his customers—his business—everything is *valueless.*

When a customer calls you in to repair a leaky or cracked boiler you feel it your duty to give him a good job. That's the *only* way to make money. If your judgment tells you it's the kind of job on which to use "X" Liquid—your reputation is at stake if "X" doesn't make good. That is why we take so much care in making "X"—and seeing that it gets to you sealed—branded—and in good condition.

Now, if you should use an imitation of the genuine "X" Liquid, you are not going to get "X" results. Patents on "X" Liquid are allowed—and others are pending. The quality of "X" *can't* be imitated. When this inferior imitation fails to do the work properly, who gets the blame? Who stands the combacks? Who loses time and money? YOU—*of course.*

So we owe it to our friends to warn them that there is no other product on the market that can do what "X" does. "X" is the ONLY *Scientific* Process of repairing leaky and cracked boilers—and for making them LEAK-PROOF — RUST-PROOF — and SCALE-PROOF.

"X" Liquid is making money for over 24,000 steamfitters. These men will hardly risk their reputations on any unknown, untested product. They'll stick to the genuine "X"—*every time.*

Ninety-nine out of every hundred manufacturers of boilers and radiators use, sell and recommend "X" Liquid. Every good jobber sells it. And the Government uses "X" regularly.

Every can of "X" Liquid carries a guarantee to make 100% good—*or your money back.*

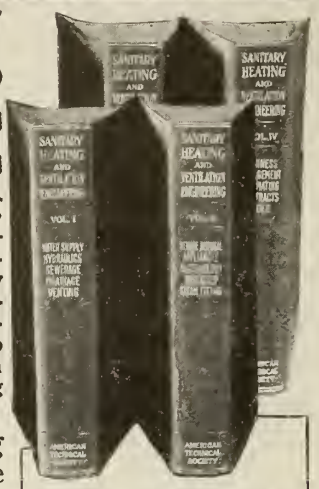
Deliveries are very bad this winter—due to freight conditions. *Keep plenty of "X" on hand for emergencies.*

"X" LABORATORIES

636 Washington Street, Boston, Mass. U.S.A.

GET IN THE BIG MONEY CLASS NOW

SANITARY HEATING AND VENTILATING ENGINEERING



SANITARY Heating and Ventilating Engineering offers wonderful opportunities for advancement and money making right now. Modern methods and appliances are fast replacing the old ones, and the men who are up-to-date — the trained men — the men who know — are going to reap the benefit.

Get your share of the big money now. Here is the first thing for you to do — tear the coupon off this page and mail it to us today. It won't obligate you in any way and you don't have to send a penny, but it will bring you these four big volumes — just off the press — packed full of the very things you need to train yourself — all worked out for you in clear, understandable English by eighteen of the most successful men in these professions today.

No matter what your job is or how much you earn, you need these books — and you need them now. If you are in business for yourself, they will make your business bigger and better — the volume on business management, estimating and contracts and specifications alone will do it.

4 big volumes, size 5½ x 8¼ ins., bound in flexible American Morocco and trimmed in gold: 1454 pages: over 1100 pictures, diagrams and plates.

Here's what the Books Contain Thousands of problems under the following headlines are all worked out and made as simple as A-B-C.

Sanitary Science and Materials.
Water Supply. Hydraulics.
Sewers and Drains.
Drainage and Venting.
Sanitary Appliances.
Sewage Disposal.
Bacteriology and Sanitation.
Infectious Diseases.
Steam and Hot Water Fitting.
Domestic Hot Water Supply.
Heating and Ventilating Engineering.
Sheet Metal Work.
Business Management.
Estimating.
Contracts. Specifications.
Mechanical Drawing.
General Index and Review Questions and Index to Each Volume.

Free Consulting Service With these books goes free a year's consulting service in the American Technical Society, worth $12.00. This enables you to consult our engineers and experts for one year without charge. Ask as many questions within the scope of the book as you want for one year.

SHIPPED FREE

Examine the books and see for yourself just how valuable they are, but don't send us any money. The little coupon is all you need. Fill out all three lines and mail it NOW. It will bring you the whole set of books by express collect, and you can keep them seven days to use as you please—study them at home—take them to your shop—try to find some problem they won't answer, and ship them back at our expense if you think you can get along without them. If you want to keep the books after seven days' use, send us only $2.00. The balance can be sent in monthly payments of $2.00 each until the special introductory price of $13.80 is paid.

It will take years of hit-or-miss experience to gain what these books will give you in a short time; so don't pass up this opportunity—ACT NOW. We may never be able to offer this low price and these special terms again—only 7c a day. Tear off coupon before you lay this down and mail *today*.

AMERICAN TECHNICAL SOCIETY

"Don't mind so much about the price, Mr. Contractor. What I want first of all is a heating plant that will heat my building satisfactorily"

"I'M just like any other common-sense customer of yours, Mr. Heating Contractor. We all have a right to demand permanent satisfaction. And if MOLINE HEAT means quality, then I'm for it! Tell me about it!"

"That's exactly what MOLINE HEAT means: Quality. I've been in the heating contracting business for ten years and I ought to know a little something about it. The one thing that I've learned best is that to put in cheap heating installation costs more in the long run."

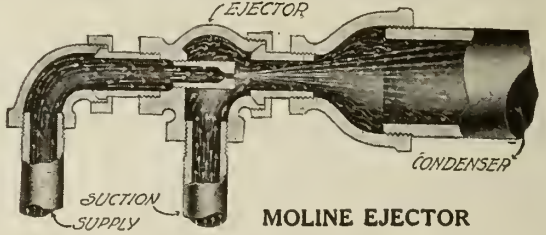
"Then why on earth do you ever put in cheap installation?"

"I don't. I quit that, years ago, after a fellow came along and showed me what MOLINE HEAT meant to me and to my patrons. I don't do business any more with people who want me to do 'cheap' jobs."

"So now you put in MOLINE HEAT, do you? How has it panned out?"

"Clean score, all the way through. I can give you the names of fifty places where I have installed it. Never anything from their owners except praise. And it has made the same record all over the United States. The MOLINE HEAT people gladly refer you to all their customers."

"Well, that's the sort of heating installation I want. Put in your estimates on MOLINE HEAT."



MOLINE EJECTOR

To learn how heating contractors build up their businesses on the solid foundation of *quality*, write to us today.

Some excellent territory still open for special sales representatives.

Moline Illinois

First Cost *versus* Upkeep Cost!

The purchase price means nothing if the upkeep cost is not low.

The purchase price of King Boilers is no more than the average boiler and yet—

The consumption of fuel—*the upkeep cost* is lower—considerably lower.

The thin, peculiarly shaped waterways in the "King" mean quickly heated water and perfect circulation, which causes a saving in fuel because it obviates the necessity of "extra firing" to move cold water from the radiators.

The Trade should use this quick-heating, fuel-saving argument now while fuel is scarce and high in price.

KERR GATE VALVES

I. B. GATE

These Iron Body Gate Valves were designed and are made by US to meet YOUR demand for strong, substantial, interchangeable valves, with a "nobby" appearance.

They meet the requirement and more. When they get us a customer they hold him.

Who in the Steamfitting trade has not heard of and used Kerr's (Weber) Brass Gate Valves? We say "Kerr's"—not the imitations. We make this valve of uniform material, and they stand up to the work given them, just as they always have. Some have tried others, but they came back to the tried and trusty old "Weber Gate" made by Kerr. What is a few cents on a valve, when you can get one like the genuine "Weber"?

Have you our Catalogue No. 5?
If not, we will mail you one.
A postal to-day will bring it.

WE SPECIALIZE IN

PIPE THREADING TOOLS

Take Another Look At This Job

ESTABLISH PEACE

If you desire to establish lasting peace in your shop, you will have to furnish your men with good tools. Men will not do the same amount of work if that work is hard. The more you *INVEST* in tools if they're good tools, the less you will SPEND in labor. To invest is to establish an asset, to spend is to create a liability. Our tools will save you money and make peace in your shop.

ESTABLISH PROFIT

Work made easy becomes a pleasure. Jardine and Toledo Pipe Threading Tools make threading pipe so easy that a boy can thread a 4-inch pipe as easy as he can thread a ½-inch pipe.

Not only so but when a thread is made with one of our tools it's a good thread. No cutting off pieces of pipe. No lost time and no leaks. That's the way to establish a profit on every job.

How long does house drainage piping last?

This illustration is typical of scores of photographs shown in Dr. Gerhard's paper on "The Relative Corrosion of Cast Iron, Wrought Iron and Steel Pipe in House Drainage Systems", copy of which will be sent on request.

And the Answer—

"While averse to speculating on anything covering a period of 100 years, the writer if asked to make a conservative estimate of the life of black wrought iron vent pipes of the Mail & Express Building, would be inclined to conclude that they would last 100 years or possibly even longer."—Dr. Wm. Paul Gerhard, Mem. A.S.M.E., Hon. Corresponding Mem. American Inst. of Arch.

If you could know that the pipe you are installing in the building you are erecting to-day would last 100 years or longer, you would feel reasonably immune to pipe troubles. Nor would you hesitate to pay a slightly higher cost for such pipe, for it would be far cheaper in the end.

The black iron vent pipes mentioned in the above paragraph, taken from a paper entitled "The Relative Corrosion of Cast Iron, Wrought Iron, and Steel Pipe in House Drainage Systems," presented by Dr. Gerhard at the last annual meeting of the A. S. M. E. were made of genuine wrought iron of the Byers quality—the kind of pipe which Byers have made since 1864 and on which their whole reputation is staked.

A copy of the report covering the complete investigation will be sent on request. It contains detailed records obtained by personal investigation of the vent and drain pipes in over 60 New York sky-scrapers and photographs showing the actual condition of the pipe.

A Veritable Encyclopedia of Motor Truck Facts, Figures, Methods and Systems

Here is a book that considers practically every phase of successful motor truck operation. It was written by S. V. Norton of the B. F. Goodrich Company, after a country-wide investigation into the possibilities of the motor truck.

It describes the many ways in which the motor truck is being used to win business, give better service and build profits. It gives a description of practical, low-cost delivery systems—tells how to lengthen the life of the motor truck—what to look out for—how to map out a complete routing system—how to figure upkeep costs—how to keep your truck going at minimum expense—in short, here is a book that will tell you anything you want to know about successful motor truck operation, that will enable you to get 100 per cent. service from its use.

Almost every method described in The Motor Truck as an Aid to Business Profits is accompanied by an illustration, a chart or a diagram. You read the description, then with a glance at the illustration you see instantly how it works and how you can apply it. If you are a motor truck owner this book will save and make money for you. If you are a prospective user it will tell you "Yes" or "No" whether the purchase of a truck is a good investment.

A Small Investment But Big Returns

A single suggestion from the pages of this book may add five years of life to your truck. One new idea may result in hundreds of dollars saved. A system of routing, a plan for keeping cost records, for winning the co-operation of drivers—any one of these may result in increased profits that before would be impossible. Yet the price of this work is only $8.50. If it does no more than prevent a minor mishap, this much at least has been saved. But it will do far more than this—actually place in your hands the plans, methods, systems and ideas of thousands of successful motor truck users. You profit from their experience—you avoid the mistakes they made—you learn where and how they saved money, cut expenses and increased earnings. 530 pages—228 photographs—4 inserts—112 sketches—forms, diagrams, charts, tables and blue-prints—all yours for cutting delivery costs and increasing your profits.

Part I—Fitting the Motor Truck Into Your Business
Chapter I—The Field of the Motor Truck in Modern Business
Chapter II—When to Change From Horse to Motor Delivery
Chapter III—Comparing Cost of Horse and Truck Delivery
Chapter IV—How to Determine Cost of Performance
Chapter V—How to Keep an Effective Record of Costs

Why Jenkins Bros'. Valves Are Superior

Fig. 106

They are the original renewable Disc Valves. They have more imitators than all other makes of valves combined. They have kept pace with increasing steam pressures and severe working conditions. They are of the simplest design, and can be easily repaired by any man of ordinary intelligence. They are made interchangeable in every part, and any part can be duplicated promptly and inexpensively by the dealer. In the majority of cases they can be repaired by merely changing the disc without the laborious task of regrinding.

Fig. 108

Fig. 114

They are recognized as the Standard Steam Valves in all parts of the World, and wherever there are supply houses—Jenkins Bros'. Valves will be found. The Standard of quality never changes except to improve, and while to-day there are hundreds of imitators, the sales of genuine Jenkins Bros'. Valves are constantly increasing.

"The Mysterious German Onions"

On nights when the German air raiders were out, they sent up strange, luminous balls behind their lines and anchored them above the clouds—globes of fire which could be seen for forty miles or more. What these "onions" were, or how they were kept in stationary position above the clouds, is still a profound mystery. The Allies never learned anything about them, but the Allied night bombing crews steered their course to the Rhineland by the luminous buoys thus provided.

What is known about the onions is told by Lieut. J. Vernon McKenzie in the course of an article, "Raiding the Rhineland," in MARCH MACLEAN'S. It is an intensely interesting article, telling all about the great reprisal campaign which implanted the fear of war in the German civilian heart.

"NO HOPE FOR THE WETS"

"Already the temperance forces are lined up to stop any possible break in the prohibition dam," writes J. K. Munro, in discussing what is going to happen at the coming session at Ottawa. He predicts that Union Government will hold together, but that the habit it has contracted of promising everything asked is going to make a lively session. He expects:

Dry legislation at the earliest possible moment.
The moral reform forces in control.
No change in the Divorce Law.
Tariff concessions made to the West.

The March number, in fact, is full of live, up-to-the-minute features.
The famous Canadian Ace, Lieut.-Colonel W. A. Bishop is on the cover.

Some of the outstanding articles and stories are:

The Transformation (a new serial)—By Frederic S. Isham.
A Canadian King-maker (the story of Lord Beaverbrook in Britain)—By Maurice Woods.
Fitting in the Returned Soldier—By George Pearson.
The Three Sapphires—By W. A. Fraser.
The Strange Adventure of the Nile Green Roadster—By Arthur Stringer.
Fakers—and Others—By E. Ward Smith.
Lend Me Your Title—By Onoto Watanna.
A Shady Deal—By Archie P. McKishnie.
The City of Lost Laughter—By Mary Josephine Benson.

The Voice of Canada Interpreted

A new department starts in this number given over to summarizing and presenting opinion in Canada on outstanding topics, as reflected in the press. In this issue the department is given over to a careful compilation of opinion on the problems of the returned soldier.

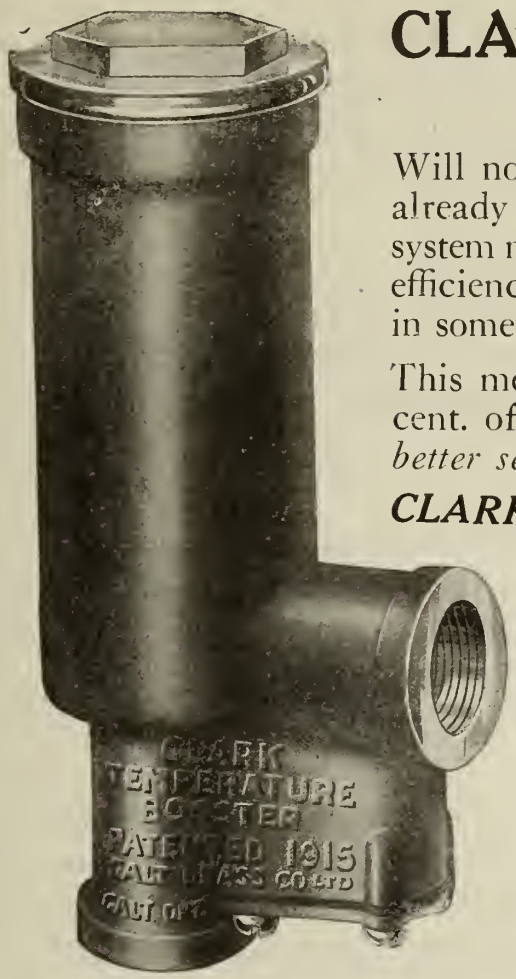
DON'T FORGET THIS



CLARK TEMPERATURE BOOSTERS

Will not only improve a hot water system already in service, no matter how well the system may work. But it will create a higher efficiency to the extent of 15 per cent., and in some cases more.

This means that in a good system 15 per cent. of fuel can be saved and still *have a better service.*

CLARK TEMPERATURE BOOSTERS

Will save pipe and fittings when installing a new job. Because it increases circulation. It increases the temperature in the water, and therefore a less volume of water at a higher temperature is necessary to give off a given amount of heat units.

Here's Some Real Information

Suppose a certain building required 1,000 square feet of hot water radiation to heat it to 70 degrees Fahrenheit when the outside temperature stood at 10 degrees below zero. Basing the radiation on a water temperature of 212 degrees, a Clark Temperature Booster would raise that volume of water 15 per cent. higher, thus only needing 850 square feet of radiation for the same building. Figure that out and you will find we can save you money all along the line.

Write your jobber or write us. It's all the same to you or us.

GALT BRASS CO., LIMITED

GALT, CANADA

CATALOGUES FOR THE PLUMBERS

Some months ago we issued our Booklet showing Plumbers' Enamelware for the home, and many of the leading jobbers in Canada were good enough to say that it is a most useful and convenient catalogue.

It shows the popular and leading lines of Baths, Lavatories, Sinks and Laundry Combinations, and is just the right size to put in your pocket when you are visiting your customer for the purpose of interesting him in a new Bath Room.

The fixtures are beautifully illustrated and attractively trimmed with modern and up-to-date brass or nickel-plated fittings. Prices are quoted in plain figures, and are such that the Contractor or Sanitary Engineer can make a fair profit on his sale.

The policy of the Company is to distribute through the recognized jobber as a convenience to the Sanitary Engineer. This enables us to keep a good stock at all the principal points of distribution, and enables the Contractor to obtain "PORT HOPE" Enamelware at the minimum cost.

By the way, we will have our Booklet "Enamelware for Public Buildings and the Factory" from the Printers early in March. A copy will be mailed to you. If you don't get it before the 15th, write us. It's well worth having.

SANITARY ENGINEER

VOL. XIII. MARCH 1, 1919 No. 5

Help Along the Housing Scheme

The Trade Can Do Much—Men Should Be Encouraged to Buy Their Own Home and Vacate a Rented Home—Each Would Then Be Vitally Interested to Keep Down Cost—Workmen Owning Homes Help to Stabilize Industries

By One of Us

IT WOULD be safe to say that of all the problems, one of the most important ones to solve in Canada is the housing question. There are so many angles from which to view it and so much depends first and last upon the providing of homes for our returned men, as well as for natural expansion of our population, that it would, we believe, be a good thing if each workman would be made to see all the benefits to himself that would accrue if he would take advantage of the offers which the Governments, Federal and Provincial, are putting forward.

There are thousands of journeymen sanitary and heating engineers who need homes of their own. There are thousands who, no doubt, will be looking for a job unless this housing scheme is boosted along. The last Victory Loan was over-subscribed for the purpose of keeping industries going, manufacturers of all lines were told to expect lots of export orders, and so on. But the manufacturers of sanitary and heating goods in Canada are not naturally exporters. Canada has been importing vast amounts of plumbing and heating goods, and frankly we do not see how our particular manufacturers can all at once begin to expect export trade. Therefore it would appear that the best way out would be to boost along the various housing schemes. The Government is financing the projects, and the trade can take work on. Workers are becoming more numerous, and therefore will be ready to execute work to advantage this summer, so that houses in large quantities will be available for occupancy before the winter is upon us.

Now, one way by which this scheme can be boosted would be for every employer to take this matter up with his employees, discuss the question, and see how many houses could be built for employees. These men could even arrange to work in the very houses in which they hoped to live, and this would be an incentive to them to do the work well and do it quickly, so as to cut down the cost as much as possible. It may be argued that as tenders would first have to be furnished, the cost of a given house would be based upon the tenders for the various kinds of work contracted for, and that prices in that case would be fixed.

Here is, however, another side to the question. Suppose, for example, that John Brown & Co. procures a contract for plumbing to be installed in twenty-five houses, and he has Tom Jones, plumber, working for him. Tom is going to buy one of the twenty-five houses and has made his choice. Mr. Brown says to Tom, "Now, boy, my tender for these houses amounted, for plumbing, to $300. If you can cut on the cost allowed I'll meet you in sharing with you a substantial amount of the money saved." And suppose that Tom can see himself getting a 10 per cent., or even a 5 per cent. reduction, does it not stand to reason that he is going to put some pep into that job? Why of course it does.

And the same arguments could be used all along the line in every trade. There is need of some real educational work in connection with this scheme. Speculators want to be told that no non-producers will be allowed to participate in this housing scheme, that land must be expropriated or procured at prices which will not permit inflated profits being paid. In fact, the sooner people learn that land speculating of all kinds must cease, the better it will be for all. The cost of building lots must have a great bearing upon the class of house built, and if the standard lot suggested by the housing branch of the Commission of Conservation is to be, in towns, 1,800 square feet, and in rural districts 4,800 square feet, then without doubt the cost of city lots must come down.

In conclusion, it seems to the writer that it is the duty of every sanitary and heating engineer employing a number of workmen, one or more, to give this question some deep thought and discuss it with these men from every angle. Every applicant for a home is no doubt making a job for himself. Let's all get behind this scheme and help it along.

TRAVELLERS AND HEALTH

During the past few months the members of the branches of the Order of United Commercial Travellers in Saskatchewan have been very active in endeavoring to bring about a better condition of things in the way of hotel accommodation. For a long time complaints have been very bitter in regard to this matter, and after a number of discussions in different parts of the province it was definitely decided to bring the condition of hotels and boarding houses, especially in the country places, to the notice of the Provincial Government. This has now been done, with the result that Premier Martin has interested himself in the question and has promised that reforms shall be instituted at any early date. Any changes that will be made will be purely for the protection of the travelling public and those persons who are compelled to use public eating places. The members of the Moose Jaw branch have seriously complained at the lack of comfort and even of cleanliness that has been experienced, and in some cases they have brought to light a state of affairs that showed that a grave menace to public health has existed.

The lines upon which reforms are promised can be found in the provisions of a bill which was introduced into the Legislature in Ohio, on January 21, 1919. Travelling men who have examined its provisions say it covers every point, and is an ideal piece of legislation for its purpose.

The Bill further provides that every hotel or restaurant shall have proper plumbing, lighting and ventilation, which shall conform to the building code. All lavatories, bathtubs, sinks, drains and urinals shall be properly constructed and shall be kept clean and well ventilated at all times.

It would be a mighty good thing if travellers in sanitary and heating goods would themselves take a little more interest in these matters and suggest improvements, by taking up the matter of insanitary conditions with the local sanitary engineer, pointing out how sales can be made and jobs secured.

Dobson Stages a "Come Back"

A Moses Irons Salesman Takes a Hard Fall—But Learns That a Bump in Time May "Save the Bacon"

(Reprinted by kind courtesy of "System, the Magazine of Business")

By DANIEL LOUIS HANSON
Illustrations by George Brehm

THERE was gloom in the front office; gloom on both sides of the flat-topped desk. Gloom enshrouded Moses Irons, and gloom enshrouded John Renwick. The countenances of the two men, between them, couldn't raise a ghost of a smile.

But it was John Renwick who felt the first impulse towards action. "We will discharge Dobson!" he exclaimed vindictively.

"Why?" was Moses Irons' simple inquiry.

John Renwick looked at his chief in amazement: "Hasn't he lost the Hydeville High School contract for $13,000?"

"No; for $13,303.09. Will you never learn exactness, John! But in Minneapolis two years ago he lost a $50,000 order and still stayed on. You never even whispered to me that he should be cashiered."

"That was a cast iron pipe order; only price talked then. To have mentioned quality would have made the very streets laugh. And the loss of that didn't hinder our going up and scooping the next big order the following year.

"But this Hydeville deal was more than an order; it was a precedental proposition; nail that and we were good for the rest of Hydeville schools till the end of time. Quality was the 'open sesame' on this proposition—and we surely had the quality stuff, didn't we?"

Moses Irons acknowledged that they had. "I see—now out, out for all time. This was the Mayflower order of Hydeville from which all subsequent orders would spring and have standing. I don't like it, John, but to fire Dobson for this —"

"But Dobson has been going down hill for some time," broke in Renwick. "I still insist that there is such a thing as periodicity in the business lives of men. Dobson is 38 and the brain wrinkles have been hardening for two or three years. He is less susceptible to outside impressions and slower on making up his judgment of men and things. He has gotten so that he can't see the other man's viewpoint, therefore he can't plan a sales campaign effectively. Osler was right in his diagnosis, but extreme in his remedy, of course. I—"

Here Moses Irons broke in: "As a diagnostician you are an artistic success, John! Another sentence or two and I would have been paying Dobson a year's salary as premium if he would quit at once. What Dobson needs isn't a post-mortem, but a tonic. He lost that high school job, but I don't intend that there is going to be any precedent about it! He's in the second trench only—and that means nearer the front than the rear.

"Byshee, telegraph Dobson to go back to Hydeville and wait for me. Then look up my trains and make a reservation for to-night."

The Dobson who awaited Moses Irons in the Grand at Hydeville the next morning was well-gotten up, hardly looking

Renwick attempted to speak, but Moses Irons had the floor: "Hardening of the brain wrinkles is no imaginary ill, but the brains of a sales organization are supposed to center in its manager"

his 38 years. His address was impressive, his good fellowship was written all over his face. In short, he was the sort of man whom men like to be seen with. Yet he had lost that initial order of $13,000 to the Vento Company—a concern which turned out school fixtures that were a menace to the health of any community. Again and again during the last three years the Vento fixtures had been ripped out of schools in the largest cities and Moses Irons'—or others of equal standard—were installed.

It was generally believed that the Vento Company was on its last legs, yet here it delivered a knock-out blow to the best advertised goods on the market.

II

"Just what was the matter?" asked Moses Irons after Elmer Dobson had finished a detailed statement of the fight. "Were you to blame, or were we in Chicago at fault? Hadn't we worked up the field properly with our advertising campaign—sort of barraged it for you? Or are you getting so that you take things easier—don't work so hard?"

"As I stated, it was a case of 'buy'—" began Dobson. Moses Irons made a gesture which suggested a housewife brushing down cobwebs: "You are too quick in making that charge, Dobson! There is much less trickery of that type in public work of this kind than either you or John Renwick seems to be willing to believe.

"Granting, however, that there was crookedness, that's the easiest of all competition to face. I would rather have competitors who are crooked—looking at it from the 'get the order' standpoint—that to be faced with a chap who is on the square.

"Tell me the viewpoint of the schoolboard—just what they said to you after handing out the order to the Vento Company."

It appeared that the schoolboard, through its chairman—a physician at that!—had talked learnedly with Dobson about the superior merits of the Vento fixtures, where a current of air was the disinfectant rather than water as with most modern and generally approved plumbing fixtures. . . .

"Repeated the Vento Company's dope throughout, eh?" exclaimed Moses Irons. "I see that our advertising is off somewhere. I'll tell Renwick the moment I'm back in Chicago! When that old stuff about air versus water, as the medium for sewer disposal, gets in under the skull of a physician, we need a new advertising manager.

"But where were you all this time?" he demanded of Elmer Dobson after he had diagnosed the failure to land the order.

The explanation the salesman made cleared the situation to Moses Irons. "You have grown to depend so on your advertising department having the field ready for you that you were surprised; Blucher didn't arrive and night was too far off, so you were Napoleon at Waterloo." With this rather mixed recollection of what happened 100 years earlier, the ironmaster set out to retrieve the ill fortune which had fallen upon his establishment in Hydeville a few days before.

"You used the arguments about typhoid being spread by unsanitary plumbing fixtures, I suppose?"

"Yes; the water supply of Hydeville is above suspicion, so whatever disease of the kind exists is due to bad plumbing."

"And how much exists?" asked Moses Irons.

This question Dobson couldn't answer; he had talked generally instead of specifically.

"You didn't localize," said Moses Irons, leaning back in his chair. "You have talked about bum plumbing propagating and spreading typhoid—you failed to tell how and where it spread that disease right here in Hydeville.

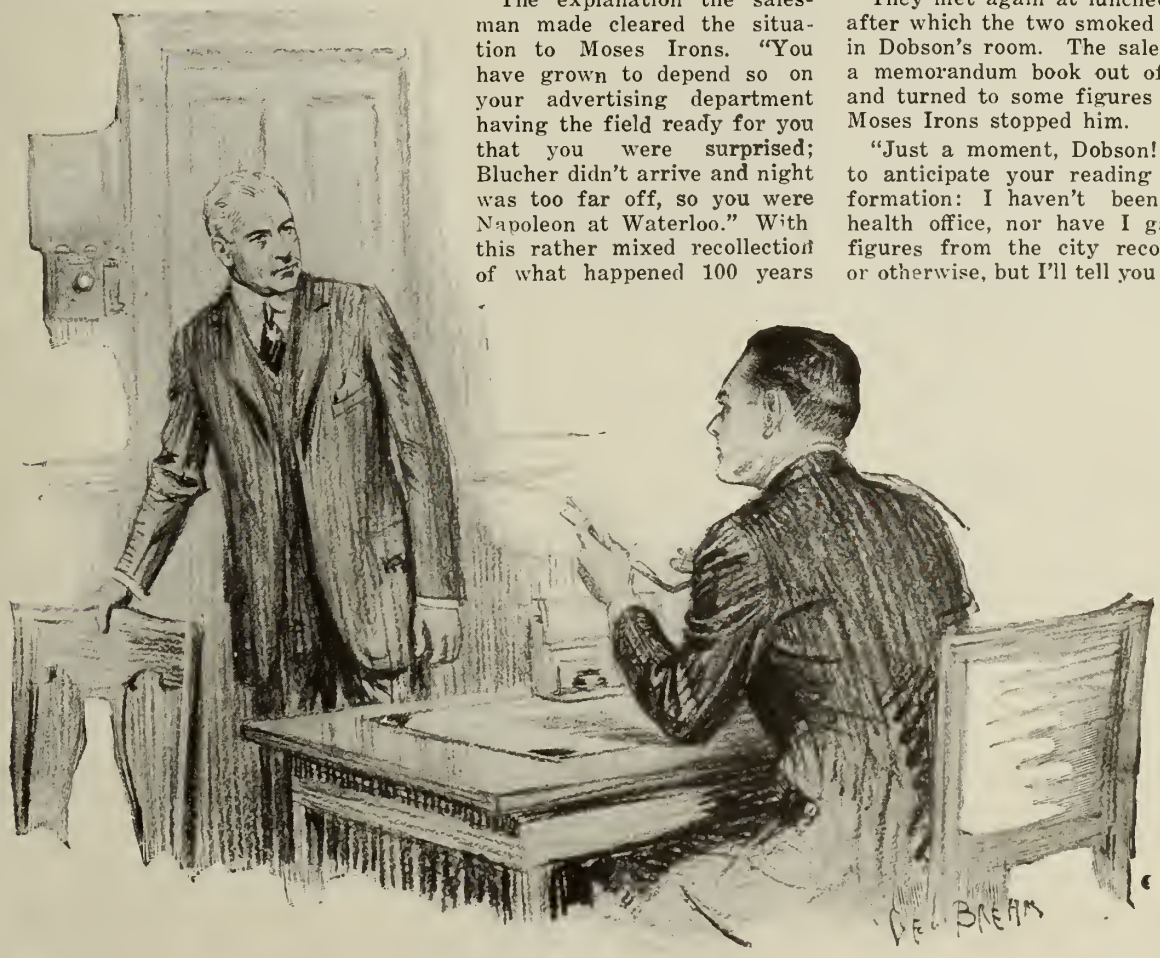
"Did you interview the local health officer? . . . I thought not!"

"It would seem that they, and especially the physician on the board, would have been quick to draw the local parallel," Dobson argued.

"That was your business to do, sir! Now let's get busy and obtain the sick records for each ward of the city during the last two years as they govern typhoid—and typhus, if there has been any. I'll look around town and get a general view of the situation."

They met again at luncheon that day, after which the two smoked their cigars in Dobson's room. The salesman pulled a memorandum book out of his pocket and turned to some figures therein, but Moses Irons stopped him.

"Just a moment, Dobson! I'm going to anticipate your reading of that information: I haven't been near the health office, nor have I gathered any figures from the city records directly or otherwise, but I'll tell you what I have



The salesman pulled a book out of his pockets and turned to some figures, but Moses Irons stopped him. "Just a moment, Dobson! I'm going to anticipate your reading of that information"

learned by keeping my eyes open.

"There is more typhoid in the Third Ward than there is anywhere else in Hydeville, isn't there?"

"Yes, sir."

"Next comes the Fifth Ward, then the Fourth, while the First and Second are comparatively free from it."

"You have called the turn, Mr. Irons, but how?" asked Dobson.

"By looking over the plumbing of the various school houses; the Third Ward school has the vilest type of 'fresh air' fixture. Therefore I reasoned that typhoid would prevail there more than in the other wards, where conditions are not so bad. The Fifth has the 'fresh-air' system in only one of its two schools, while the Fourth has only a few fixtures of that type in use.

"The First and Second Wards have nothing to boast about, but their sanitary equipment is the water-scouring type of one make or another and causes their localities to be comparatively free from filth diseases.

"Now, my boy, you have your task laid out for you; they are just laying the high school foundations. It will be over six months before anything but the bare walls will rise—by then you not only can get back into the first line trenches, but you can go over the top and bring in that high school order."

"But how?" demanded the confused Dobson.

"By working matters so that the school board will be compelled to install new plumbing fixtures in the Third Ward School."

"But that hasn't even been talked of!" protested Dobson.

"That's where you will have the inside, Dobson. The Third Ward School must be equipped with Moses Irons' school fixtures during this vacation period. You will have three months; it isn't a large school and the installation will be quite easy. Then with Moses Irons' fixtures in the Third Ward, don't imagine for a moment that the people of Hydeville will consent to having the filthy Vento system in their $100,000 high school building."

"But the people haven't anything to say in the matter." Evidently Dobson's faith in the power of a free people had been considerably shaken.

"Don't deceive yourself, Dobson! Salesmanship as applied by us supply houses to public institutions consists, in its highest exemplification, in selling to the public and not to a few officials invested with a brief authority. That's where you missed your cue before. Get after the public this time."

And Moses Irons drew his chair alongside of the table and began to talk to his salesman in the low voice which always indicated that he was down to brass tacks.

III

John Renwick was gone that August when the order for the Hydeville Third Ward School fixtures came in, and so much work was piled up on his return that the complete shipping slip went through later without his noticing it in a particular way. So it was late November before the subject of Hydeville again came up.

One morning Renwick was delayed by a hot box on his train and didn't reach the office until nearly noon. In the meantime Moses Irons had gone through the orders and sent those marked rush to the shipping office. So it was a fairly clean desk at which Renwick sat down. There was a note from Mr. Irons, however, on the calendar pad:

"Lunch with me at one—please—Kingsley's."

They had finished the Lucullian banquet from which Moses Irons never varied whenever Renwick was his guest—planked whitefish with plenty of watercress, hard rolls, a side dish of celery, and tea: "Whitefish doesn't overheat your brain, John; and the afternoon is when your brain tends to overwork," Moses Irons had said, as on every former occasion of the kind.

And now they settled back for what the Ironmaster had up his sleeve. Renwick couldn't even guess its nature.

"We never had any talk about that Hydeville affair, John; you had to leave the city the morning I came back from there and you were gone in August when the order for the Third Ward School went through. But you remember that you wanted to fire Dobson for falling down on the deal?"

"Yes, and I still think I was right. There wasn't any excuse for our losing that order."

Evidently the whitefish and tea had left Renwick with a clear brain.

Moses Irons nodded: "I agree with you, John. Someone should certainly be fired for losing such an order!

"I found that Dobson had gone out there and passed around some platitudes about 'fresh air' fixtures being detrimental to the health of a community—not that particular community, but any old place. And at that, with some irrefutable data at his command which would have won him the deal, he nevertheless let the Vento Company walk away with the $13,000 plum."

"Hardening of the brain wrinkles, self-sufficiency, and lack of ability to see the other fellow's viewpoint," was Renwick's comment. "Nothing is gained by keeping such a man on the payroll." He added this last because he thought he saw symptoms of finally swinging Moses Irons his way.

"It looked as if you were right," yielded Moses Irons, and Renwick didn't notice the use of the past tense. "Well, I did my best to show him where he had been at fault; and I made it clear to him that you would not be satisfied with anything short of either his resignation or the complete order for the high school fixtures!"

"The order for which was already placed with the Vento Company," commented John Renwick.

"The order for which the Vento Company already had," agreed Moses Irons. "Naturally Dobson felt the matter keenly, as he should; but he got to work at once to get back into the first line trenches—and over the top.

"First he dug out statistics which showed that the Third Ward, which had the 'fresh-air' system in it entirely, also had the highest rate of typhoid; that other wards with only partial systems of that type had lower rates, while those with even the crudest water-scouring closets were practically free from the plague.

"He then dug out from the Third Ward a young, zealous, and ambitious physician—the last quality, ambitious, not having much scope in the Third Ward. With this man he became closely acquainted, laid before him the relative health figures, and, I think, took him to an adjoining town or two to point his argument, until the young physician was convinced that health and plumbing were hitched up together; also that the workingmen's ward, as the Third was termed, was getting it in the neck."

"What did this cost Dobson?" asked Renwick.

"Nothing except those rides to nearby towns, there is more public spirit among folks than a few crabs will ever understand—" Moses Irons said this in his smoothest tones.

"Then, having gotten a signed statement from the physician, Dobson took it to both the daily papers. The Bugle, a moss-grown party sheet, refused to print it; the Free Lance, the less prosperous and more awake, took it under consideration and after an investigation, during which Dobson was particular that the young, zealous, and ambitious physician got well acquainted with the young zealous, and ambitious editor, gave the stuff publicity through its editorial columns.

"Dobson had some photographs taken of that Third Ward School, which in due time appeared in the Free Lance, for the editor wasn't satisfied with one blast any more than Dobson and the physician were; he went back to the subject again and again."

"And what did all this cost?" again asked Renwick, who wasn't quite sure by this time whether the conclusion of the conversation would be especially to his liking.

"The price of those rides to nearby towns—possibly $10—plus the price of photographs—possibly $5. We can go over the expense account later, John. Then, the Free Lance having established pretty well in the minds of the public that 'fresh-air' plumbing fixtures weren't sanitary, Dobson had inserted in both the Free Lance and the Bugle advertisements of Moses Irons' Sanitary Plumbing Fixtures for Schools—"

"I never saw the copy!" sputtered Renwick.

"But the public of Hydeville did. And the public of Hydeville insisted that new fixtures be installed in the Third Ward School instanter. The school board, in the face of the Free Lance revelations of what the 'fresh-air' system had done, couldn't very well buy Vento Fixtures, for Dobson's advertisements, while not attacking the Vento Company, had clearly pointed out that the principle of using anything but water as a cleansing agent was vile.

VOL. XIII. MARCH 1, 1919 No. 5

LICENSES AND EXAMINATIONS

THERE is a feeling abroad that men in the plumbing and heating trade need no more to be licensed than should a bridge worker, a bricklayer or a painter. That the work of a plumber and steamfitter is only just a little bit removed from a laborer, etc. Many architects and speculative builders and bulk contractors hold such opinions, and, in fact, some of the two last-named classes of fellows are not a little peeved to think that they cannot procure an unlicensed man now to do their work on a percentage basis, etc., the bulk contractor getting the material, etc., as "wholesale."

Well, now—it may be all very well from their side of the fence to hold such opinions. But there are other sides to the question. In the first place, it does require skill and lots of it to install plumbing and heating. It requires years of training and then not all has been learned that there is to learn of the science of plumbing and heating.

And, again, when a householder calls in a man to make some repairs to a defective or leaking pipe or trap, he requires a skilled man. When an architect submits plans for tenders on heating or plumbing, or both, the chances are that a skilled man will have to go over the "layout" very carefully and in most cases re-design the whole system.

Expansion and contraction has to be understood and provided for, free flow of wastes must be planned, the elimination of obstructive turns and bends and provisions to clean out piping at various convenient locations — a thousand and one problems have to be worked out, all requiring skill. Now, what objections can there be to rules and regulations that are put into force and enforced, if such are necessary to safeguard the public's interest in the final analysis?

Take heating, for instance. If men were required to pass an examination and be licensed before they were allowed to install furnaces, thousands upon thousands of tons of coal and other fuels would be saved, and hundreds of lives that have been lost would not have been lost. During the winter months scarcely a week passes that one does not read of someone losing his life as a result of defective furnace installations.

So that when we consider that the work of sanitary and heating engineers involves the lives and health of our citizens, it is only just, right and fair that some jurisdiction be enforced to prevent impractical men from engaging in such important work. They are custodians of the lives of those persons for whom they labor.

LICENSES REFUSED TO AMERICANS

TO the average reader it would, on the face of the matter, appear rather strange to be told that an American plumber cannot get a license to work at his trade in Toronto. But according to the Toronto *Star*, Feb. 13, such is the case:

"A morning paper statement that American business people 'would be expressly exempted if the anti-alien by-law were adopted in Toronto,' is not being well received by American business men here, who point out that the Toronto Police Commission a few weeks ago passed a regulation which prohibits Americans in this city from engaging in businesses which require a license. The fact is that Americans are to-day being refused licenses at the City Hall and it is understood that the United States Consul has protested in vain. An American cannot get a plumber's license or a restaurant license or a laundry license, or any other license under the Police Commissioner's jurisdiction. The new regulation says that these can be granted only to British subjects or native-born Canadians. And all others are being refused. Chinamen, of course, are being refused renewal of their laundry licenses.

"So far as can be learned, however, friendly aliens who were in business here prior to 1919 are not closing down in the meantime, as they understand that the Board of Control and Police Commission will get together and see whether a distinction cannot be made between friendly and enemy aliens. A peculiar feature of the situation is that many aliens got licenses for the year before the commissioners made its adverse ruling and a license, once granted, cannot be revoked.

"To get a license to-day, an applicant who has been naturalized must be able to produce his papers."

Such a state of affairs is likely to have a very important bearing upon the plumbing trade—from several angles.

In the last issue of SANITARY ENGINEER there appeared an article which dealt with the apprentice question. It showed that up to the present time very few Canadians are learning the plumbing trade, at least not in a sufficient number to keep up the demand for plumbers or sanitary heating engineers. The article stated that most of the full-fledged journeymen came from England and Scotland.

There was some hope of getting a few from the United States, but, with the alien law being put into

force, that avenue for a supply of journeymen will be closed. However, there is another reason, too, in Toronto why licenses would not be freely granted to applicants. An applicant for a license to work at the trade is required to pass an examination. He has to go before an examining board, and answer questions, oral and otherwise, and he must show that board that he has had sufficient practical experience to enable him to execute certain work in a proper and skilful manner. This procedure must be carried out no matter where the applicant was born—Canada or anywhere else.

Thus it will be seen that it is very necessary for the trade to encourage young men to enter the profession and become apprentices, as well as that employers should pay more attention to the apprenticeship problem.

In next issue the first part of a bulletin appears, which explains what is being done in Wisconsin, U.S.A., regarding the apprenticeship problem, and we would recommend every earnest reader of SANITARY ENGINEER—employer, manufacturer and journeyman—to devote some little thought to this question. It is only by so doing that the Canadian trade can ever hope to solve the problem.

A HEALTHY COMPETITOR

WE have still a number of men in the trade, and in fact we find them in all trades, who are for ever in fear that their competitor may "Get Wise" regarding certain methods adopted in a shop, which methods are proving a success.

In another part of this issue will be found an article on the use of motor trucks. One member uses a truck to do repair work and adopts a method of carrying all the necessary tools and repair parts, pipe fittings, etc. Another drives his men to and from a job, gets a list of material required for a job, and takes it out at the same time as inspecting the work. Still another buys a motor cycle and a side car with tool box attached and so on, and all are more or less making a success of their enterprising move.

But why all this secrecy? The chances are the other fellow has gone into the question of cost in the first place before taking the jump, and the cost has looked out of all proportion to the service.

However, here is the question. Time is money, and money makes the mare go—even to the extent of making the mare shift out to make place for a motor truck.

The point is that there are no secrets on this earth, except possibly in Germany. Let them stay there, and let us get down to business and realize that to have successful competitors who adopt sound business principles is far more to be desired than irresponsible men, who merely guess success and lose out in the end.

Of course, we must admit that there are certain limits beyond which a person should not go when enlightening his competitor. But, as a rule, showing all the cards proves best in the long run. It is the men who fail in business, and are not strong enough to meet every adverse move, whom we have most to fear—not the successful competitor.

He Wouldn't Advertise

HE started in to run a store like lots of folks have done, he reckoned he could go ahead and make the business hum. He got a corner site, he did, he daubed it up with paint to make the place he picked upon look somewhat like it aint.

And then he went and bought his stock, 'twas new and likewise crisp, he reckoned that this outfit would keep them coming brisk.

He stuck a sign upon his door, another on the wall, they were artistic things, by heck, like yeller leaves in fall.

He got a rig to peddle with, he had that painted too, all fussed and frilled about his name in colors red and blue.

He figured folks would see that name at either aft or for an dtrade would come a-crowdin' then unto his plumbing store.

The paper man dropped in one day, he ran a goodly sheet, he told the plumber man how he could put him on his feet—but this here gent he chucked him out, in business he was wise, he wasn't tossin' up his coin, he wouldn't advertise.

If other folks was usin' space that was their own affair, he'd build his trade upon his goods, and prices what were square.

But somehow folks they didn't fall for all his painted signs, nor yet for all his painted rigs, and stuff up with the times. They 'llowed as how his store was nice, his goods were all right too, but they didn't know just when he had some fodder that was new. He didn't use the paper that they took into their homes, and so some other plumber was pullin' in the bones.

He reckoned that the trade would come by waitin' round a spell, but while he waited half his goods got old enough to smell. But still he didn't use no space to tell the folks in town how he could 'tend unto their wants and trim the prices down.

Well, things they went along like this, they went from bad to worse, and 'bout the only thing to do was holler for the hearse. Until one day he quit the store, the trade was far too tame, and the chap that has the business now—the bailiff in his name.—ARK.

The Value of the Motor Truck

Information Furnished by Our Readers Shows That Motor Trucks Are of Great Value to the Trade—Not Yet Fully Taken Up—Time and Money Saved—More Work Done—Men on Jobs Get Material Quicker

MANY men in the plumbing and steamfitting trades are asking themselves at the present time: "Is a motor truck a real saving in my business?" With the view of being able to answer the question, SANITARY ENGINEER sent out several hundred letters to its readers, asking if they use motor trucks; if so, how many, and what make? Whether they use solid rubber tires; how long they have used their trucks; what the carrying capacity is, and whether they use them in their jobbing and repairing work?

Of 79 replies received to date of February 24th, it was found that 42 of this number use either a truck or a car in their business of a capacity of ½ to 1 ton.

The ½-ton truck costs in the neighborhood of $300 per year for upkeep. A firm in Stratford runs two ½-ton trucks at a cost of $200 per year apiece. These trucks are used in both town and country. In the West the truck costs more. Running expenses are $1.50 per day, which would amount to about $450 per annum; these figures are cited by a firm in Regina, while another Saskatchewan company calculate on from 6 to 7 cents per mile, which amounts to about the same figure. The former firm use their cars both in city and country work, and have found them so satisfactory that they are preparing to add another to their number at no very distant date. The latter firm use their car almost exclusively on jobbing and repair work, and feel they could not be without it. The one-ton truck seems almost as popular as its smaller brother, several larger firms having one or more of these. The one-ton truck costs about $400.00 per year in upkeep—which includes "gas"—as against the ½-ton truck of $300.00 per year. A firm in Grimsby does 8,500 miles per year and reckons their expense at 4 cents per mile. They have been using a truck for 5 years. Each year they trade in their car and get a new one, paying the difference between the value of a new and old one and thus cutting down their repair bill very greatly. This system is in general favor among the most successful owners. "Cheaper by far than a horse and wagon," is almost the general verdict.

A Dunnville firm use a ¾-ton truck and for four years have found that for repairs only such a truck costs about $100 per annum.

A St. Catharines firm using a ¾-ton truck states that, while they have not any figures available, they have estimated that their truck cost 40 per cent. more than a horse and wagon, but at the same time 75 per cent. more work can be done.

In Toronto one firm of plumbers and steamfitters have used a 1-ton truck for a period of 10 years, and estimate the cost at $4.00 per week, while another Toronto firm use a touring car to take their men to and from work and for their foreman on his tours of inspection. A firm from Amherst writes that before they got their ¾-ton truck 2 years ago, they used to pay $400.00 per year for hauling. This is what the truck has cost them, but their hauling has increased.

A Kamloops, B.C., concern use a car to take their men to and from work. They have had their car for a year and so far it has cost them $200 for oil and gas.

The opinion of the vast majority of car owners is that the truck saves a great deal of time over the horse, that it is more reliable, and, in most cases, less expensive.

Now, the question most important these days is: Are members of the trade using cars or trucks to the extent that they really should? For example, as a result of interviewing personally a number of plumbers and steamfitters who do not use such appliances, cartage accounts ranging from $150.00 to $750.00 per year were shown us. Not only so, but there are without doubt certain losses in time of men waiting at jobs for material. Such losses are beyond the control of those having to pay for the cartage hire. So that there are many items of loss not apparent, and not fully realized until a truck or car is actually acquired.

Then again there is the time saved by the proprietor of the business, streetcar fares, time saved walking, etc. All means a saving in cold dollars and cents, and when one realizes that a ½-ton truck or small runabout can be procured, and paid for out and out, in a matter of 3 years, in actual time saved, it is no wonder that almost 50 per cent. of the replies received from our inquiries state that the writers are users of trucks or cars, or both.

This is an age when time is about the most valuable commodity. Cost of labor is high, money must be turned over quick, and more work must, therefore, be squeezed into a day. The car or truck has a tendency, too, to speed up all interested, and it is ready at a moment's notice.

In the next issue of SANITARY ENGINEER we will show our readers how some of the trade use trucks as well as cars. We will also show how the truck or car service charges should be made out. The replies we received did not give any real data as to how certain costs were arrived at. So that in our next article we will endeavor to give more particulars, etc.

USES OF ZINC IN THE BUILDING TRADES

With the spread, among builders, of the knowledge that zinc is made remarkably ductile and tough by rolling, that metal is steadily displacing the more expensive lead and copper for roofing, flashing, spouting and guttering. In many situations galvanized iron, commonly used for outside work, is cheaper in first cost, but when length of life, cost of painting and replacement are taken into account, it is more expensive for permanent construction. Rolled zinc is now largely used in the manufacture of the so-called "leaded" glass. This zinc is often giben the lead finish desired for architectural effect. Zinc is also made into the forms of shingles and tiles, which can be treated to give highly artistic effects. These possess the great advantages of durability and unbreakability. Spouting and guttering of zinc also have artistic possibilities. Zinc may be hard, medium hard and soft rolled. The hard rolled will not stand bending for seam work, while the soft metal can be drawn, bent and spun into the greatest variety of shapes. Prejudice against the use of zinc has its root in ignorance of these various qualities. No one using brass sheets would order it without specifying the kind of brass, yet ordinary sheet zinc is expected, when bought from a dealer, to meet any and every use. In spite of popular belief to the contrary, zinc is one of the metals most easily soldered.—"Chemical and Metallurgical Engineering."

WATERPROOFING CEMENT

All outside cement work should be waterproofed. Cement is porous, and absorbs water, with the result that the concrete is continually being disintegrated and weakened by the water and by the frosts. The waterproofing of cement structures has been carefully investigated by engineers, who have found that the most effective method is to impregnate the concrete with oil, whereby the absorption of water is prevented. The application of gasoline, in which from 5 to 10 per cent. of paraffin wax has been dissolved, is recommended. The fluid can be applied to a concrete surface by a brush, or sprayed over it with a hand-pump.—"Coal Age."

PROPER HEATING OF BUILDINGS PROMOTES HEALTH

By J. E. McCormick

I HAVE just received from a nerve specialist in New York a booklet entitled "The Prevention of Colds, Influenza, Grippe, Pneumonia, and Tuberculosis." Incidentally, the author thereof passes a few remarks on the subject of "Heating" and of "Humidity." I have been wondering whether or not some of his remarks might not be of sufficient economic importance to be worthy of consideration by engineers in charge of heating plants. I have never given much attention to the heating and ventilation of buildings. My chief concern along such lines has been to prevent long lines of pipe from bursting during temporary shutdowns in cold weather, therefore I am not competent to judge of the above matter, neither am I at present in a position to give it a proper try-out. I shall quote from the booklet chiefly such parts as might concern engineers in heating plants. In some instances the booklet contains several paragraphs between the parts I have selected. I quote:—

"(a) When a fluid or moisture evaporates, a chill is produced. As an example: Moisten your finger and blow against it, you will observe that the side you blow against will feel cold."

"(b) The degree of chill produced through evaporation depends directly upon the rapidity of evaporation. The more rapid the evaporation, the greater the chill."

"(c) The rapidity of evaporation depends mainly upon the degree of dryness of the air coming in contact with the fluid or moisture. Free air always contains a varying amount of moisture. The less moisture it contains the more readily it will absorb moisture, and vice versa."

"From the foregoing it should not be deduced that moist air always feels warmer to the body than dry air. This applies only when the temperature is above 60 degrees or thereabouts. At lower temperatures the reverse is the case, that is, cold moist air feels colder than cold dry air, for the same reason that cold water feels colder to the skin than air at the same temperature."

"Perhaps the most common cause of colds is the disregard for the degree of humidity in heating and ventilating our living rooms."

"As an example of the influence of low humidity, I shall cite a condition that existed at the U. S. capitol at Washington, D.C., during the winter of 1913-1914. In the hall of the House of Representatives there was a mysterious "chill." Frequent complaints were made and many illnesses resulted. The engineers forced the temperature up to 77 degrees, but still the chill remained. In the Senate hall, on the other side of the building, there was perfect comfort with a temperature of 68 degrees. Finally, after a thorough investigation, it was found that the chill in the House chamber had been due to low humidity. Tests showed that the humidity at times dropped to 20 per cent. In the Senate chamber it was nearly 40 per cent."

"Not one room in a thousand is properly humidified. It is only in our large public buildings that the state of humidity is given any attention."

"The question arises: 'What is the proper humidity for a living room?' It is agreed that from 50 per cent. to 60 per cent. is not too high. High humidity combined with high temperature is extremely depressing, but if the temperature is kept below 70 degrees, the humidity may be 70 per cent. or even 80 per cent. without causing discomfort."

"For the bodily comfort, therefore, it is necessary that our rooms be kept reasonably moist. Since we feel far more comfortable in a room heated to 65 degrees and with a humidity of 50 per cent., than in a room heated to 75 degrees and with low humidity, we could save at least 33 1-3 per cent. in heating expenses by keeping the air in our homes and buildings moist."

"To humidify a room of average size it requires that about a quart of water be evaporated daily. This produces a humidity of about 50 to 60 per cent."

"Health lies in the mean, and not in the extreme. This applies especially to heat, cold and humidity. It should be our aim to keep the body comfortably warm, cool, moist and dry, which means a humidity of about 50 per cent. and a temperature of about 64 degrees. Of course, it is impossible to meet these conditions at all times, but we can at least endeavor to do so."

The "saving in heating expenses" paragraph took my eye. It must be remembered, however, that the maintaining of a few extra degrees of heat throughout a building in New York City means a greater proportional expense than would the same few degrees in a similar building located in our colder Canadian climate. Nevertheless, if any such saving can be made in that place an appreciable saving might perhaps be obtained in Canada by the same means.

The author of the booklet mentions methods of humidifying air. Among other things he says: "There is sold in most house furnishing stores a special tank, which may be suspended from the back of the radiator. The heat from the radiator evaporates the water in the tank and thus moistens the air." The question in my mind is: If thermo hydroscopes, or else hygroscopes, were installed in addition to thermometers and means were provided whereby the engineer could control both the humidity and the temperature, would this result in an appreciable lowering of the heating expense and at the same time provide a more healthy atmosphere for the residents to live in? Will someone who has studied heating and ventilation and has been in charge of house heating plants, please give us his experiences on this subject?

What is Heat? Heat is a form of energy. By touching a body we can tell whether it is warmer or colder than the hand and by touching two such bodies in quick succession we can form a rough opinion as to their difference in hotness or coldness over a limited range, the colder body, if of the same material and of the same size, will contain less heat than the hot body or less energy is stored up in it in the form of heat. From physical reasoning it is possible to conceive of a body which has no heat at all and this body will have a temperature of absolute zero. This point has never been reached by experimental methods but has been approached to within a few degrees.

What is Cold? Cold is merely the absence of heat and in the usual sense it is used in comparing one body with a hotter one.

How is Heat Measured? By means of a thermometer which measures the temperature of the body and by means of its specific heat or the amount of heat which it contains. The amount of heat in a body depends upon its temperature and upon the material of which it is composed as well as upon its mass. Some materials require a greater amount of heat to raise them through one degree of temperature than others, for instance water requires about eight times as much heat to raise it through one degree as cast iron for equal weights.

How Was the Thermometer Discovered? The thermometer was discovered by Galileo, who first developed a thermometer having a tube with a bulb at the top. The tube dipped into a colored liquid. Temperatures were indicated by the expansion or contraction of the air in the tube and bulb, which caused the liquid to be drawn up or forced out the tube. While sensitive this thermometer wasn't very satisfactory for it was subject to fluctuations according to barometric pressure. The more modern form of thermometer with a bulb, a sealed tube and a contained liquid is also attributed to Galileo, about 1612.

Alcohol was the first liquid used and the graduations employed on the Fahrenheit thermometer were proposed by Gabriel Daniel Fahrenheit in 1714. He proposed to take as zero the lowest temperature obtainable by a mixture of ice and salt and to divide the space between this point and that of the temperature of the human body into 96 degrees. The fixed points were afterwards chosen at that of melting ice and that of boiling water at standard atmospheric pressure. This with the old divisions retained gave 32 deg. for melting ice and 212 deg. for boiling water.

For general scientific purposes the centigrade system is usually adopted. This has the zero freezing point marked zero, and the boiling point 100 deg., giving 100 degrees in between. The absolute zero spoken of above is 273 deg. Centigrade below the Centigrade zero.

How are the Fahrenheit and Centigrade Scales Converted from the One to the Other? Nine Fahrenheit degrees equal five centigrade degrees and this gives us a means of converting from one to the other. One other thing must be remembered and that is the difference in the marking of the freezing points, Centigrade, 0 deg., and Fahrenheit, 32 deg. To transform Centigrade to Fahrenheit then multiply by nine, divide by five and add 32 deg. To transform Fahrenheit to Centigrade, first subtract 32 deg., then mutiply by five and divide by nine.

If a Fahrenheit Thermometer Gives the Temperature of a Bearing as 62 deg., What Temperature would a Centigrade Thermometer Read? Subtract 32 deg., multiply by five and divide by nine. The result will be 17 deg. (nearly).

What is Meant by a British Thermal Unit (B.T.U.)? A British Thermal Unit is the amount required to raise the temperature of one pound of water through one degree Fahrenheit from a temperature of 60 deg. Fah. The temperature from which the water is to be raised is specified because the amount of heat necessary to raise the water through one degree varies slightly with different temperatures. What is it a measure of? It is a measure of the quantity of heat.

How Many B.T.U.'S are there in a Pound of Good Coal? Good coal runs from 13,000 up to 14,500 B.T.U. per lb. These figures are of course only approximate and coal varies greatly in its calorific value.

What is the Mechanical Equivalent of Heat? The mechanical equivalent of heat is the number of foot-pounds of mechanical energy equivalent to one British Thermal Unit. The most probable value is 778 foot-pounds to one B.T.U.

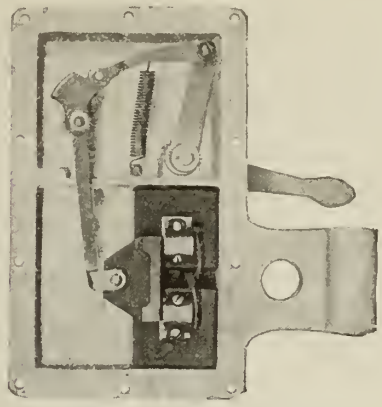
If all the Heat in One Pound of Coal Could be Turned into Horsepower, How Many Horsepower Hours Would be Produced? One heat unit or one B.T.U. equals 778 ft. lbs. Assuming a value of 14,000 B.T.U. for one pound of coal the number of foot lbs. of work stored in it will be $14{,}000 \times 778$. One horsepower hour equals $33{,}000 \times 60$ foot lbs. Therefore the number of horsepower hours will be $14{,}000 \times 778 \div 33{,}000 \div 60 =$ 5.4 h.p. hours.

VISITING CANADIAN CITIES

R. J. Dulaney, general manager of Canadian Desolvo Co. and Chamberlain Co., Pittsburgh, has been calling upon a number of members in the trade in a number of Canadian cities. He reports that the outlook is very encouraging for the sanitary plumbing trade.

ENCLOSED TANK SWITCH

THIS enclosed tank switch is of the single-pole double-break type, is instantaneous in action and suitable for use in tanks, etc., where regulation of liquid level between high and low limits is required. The construction avoids opening of the switch before the proper time and is free from the sticking and burning of blades that make trouble with a knife switch. No part of the casing or mechanism can become charged.

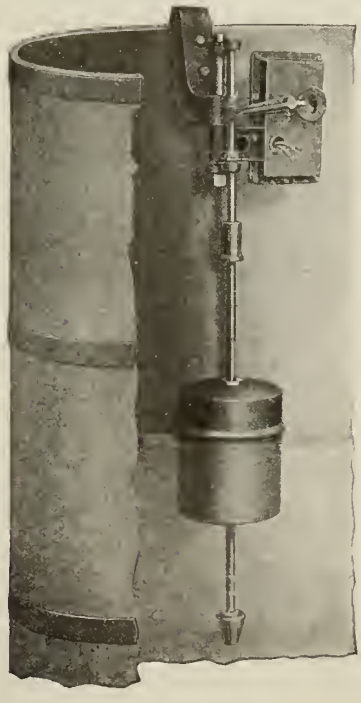


INTERIOR VIEW OF SWITCH.

The regulation is obtained by a float operating the switch, which in turn actuates a solenoid controlling mechanical or other electrical devices.

The case consists of a cast iron body and cover with corresponding flanged edges that permit the use of a gasket for damp proofing. The gasket makes it as nearly waterproof as any switch for its purpose can be. A substantial lug at one side of the back provides a means for standing to a supporting post.

The internal electrical and mechanical parts are separated by an inside dividing partition which forms two separate compartments. A block of transite ebony asbestos bolted into the electrical compartment of the case supports the fixed contacts and also acts as an insulating bushing for the incoming wires, which are brought through a boss in the back of the case. This boss is threaded to receive a ¾ in. conduit.



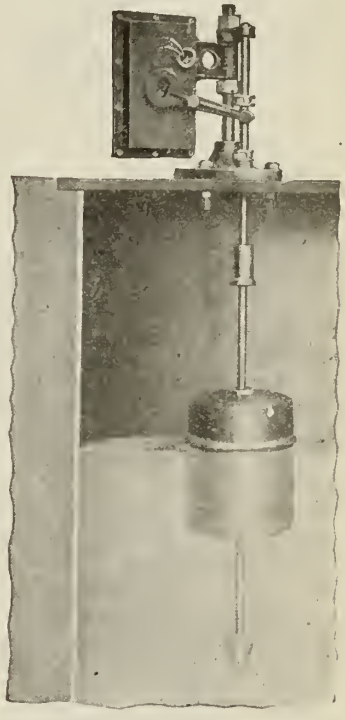
INSTALLATION IN TANK.

The fixed contacts are short cylinders of carbon held by set screws in machined brass terminals bolted to and insulated by the transite block.

The bolts which hold terminals and transite block together are countersunk and sealed at the back, and the wires are held by flanged binding screws on the sides of the terminal blocks.

The moving contact is a folded copper strip bolted to a piece of transite, which is loosely pivoted in the forked end of the cam lever. A flat spring within this fork keeps the contact piece always in correct position.

A float riding up and down on a guide rod hits a limiting stop on the rod. As it does so, the rod is carried up or down, and through collars upon its upper end



imparts a corresponding movement to the switch lever. The length of travel of this lever is limited by a stop acting in a slot on the opposite side of the lever.

Movement of the lever oscillates a shaft and "grasshopper" lever, which in turn move a roller across a cam on the end of the electrical contact lever. The roller is held closely to the cam by a coil spring fastened to the dividing partition in the case. The tension of this spring throws the contact lever with a quick positive motion the instant the roller passes over the centre of the cam.

All internal levers are made of cast brass and are of substantial size and strength.

This device is manufactured by the Blackburn Smith Corporation.

Boiler Feed Mechanism.

ing chamber connected to said lever and tending to open said valve.

4. In a boiler feed control, an equalizing chamber having a bucket therein, a connecting rod upon which said bucket is adjustably mounted, and an adjusting rod extending through the equalizing chamber and disposed to be engaged at will with the bucket to adjust its position on the rod.

7. In a boiler feed control, an equalizing chamber, a connecting rod therein having a threaded end, a bucket secured on the threaded end of said rod, said bucket being provided with a lug, an adjusting rod extending through the equalizing chamber so as to be rotated and moved axially, said rod being provided with fingers to engage said lug.

Claims allowed, 7.

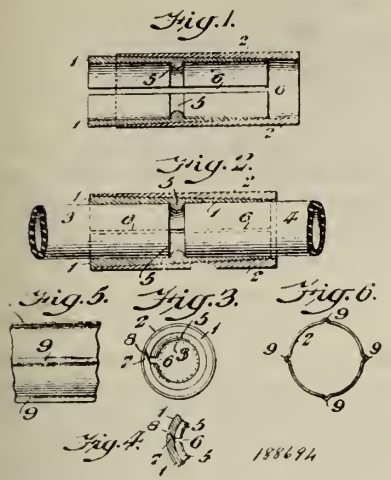
No. 188,694.

Joseph Geary Tallman, Philadelphia, U.S.A., 11th February, 1919; 6 years. Filed 25th November, 1918. Receipt No. 301,886.

Claim.—1. A coupling of the character stated formed of an inner thimble having its interior surface of cylindrical form and its exterior surface of tapering form, and an outer thimble having its interior surface of tapering form to fit the exterior surface of the inner thimble, an inwardly projecting nurl on the interior surface of the inner thimble, said interior thimble being divided through its length, said nurl being also divided through its length in register with the division of said thimble.

2. A coupling of the character stated formed of an inner thimble having its interior surface of cylindrical form and

its exterior surface of tapering form, and an outer thimble having its interior surface of tapering form to fit the exterior surface of the inner thimble, an



188,694. Pipe Coupling.

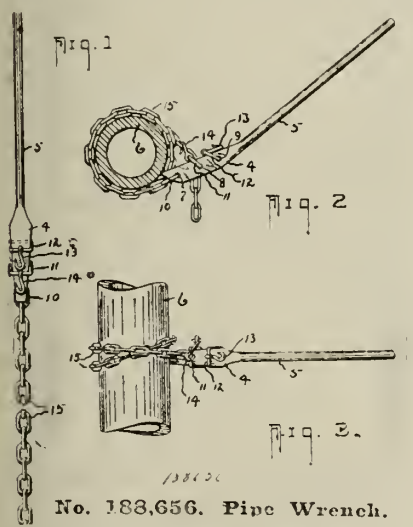
inwardly projecting nurl on the interior surface of the inner thimble, said interior thimble being divided through its length, said nurl being also divided through its length in register with the division of said thimble, the opposite terminals of the walls of the division of the inner thimble being formed respectively with an overlapping tongue and a bevel face for the latter.

Claims allowed, 2.

No. 188,685.

Frederick H. Scott, Louisville, Kentucky, U.S.A., 11th February, 1919; 6 years. Filed 16th September, 1918. Receipt No. 299,377.

Claim.—1. A tool of the character described, comprising a two-part ring



No. 188,656. Pipe Wrench.

member having its parts hinged to each other, a catch carried by one part and detachably engageable with the other part to hold the ring closed, a socket extension formed on one part, a gripping jaw slidable in the socket extension, an adjusting screw threaded in the socket extension and swivelled in the jaw, a pair of gripping jaw members detachably engaged in the inner periphery of the ring in spaced relation to each other, a two-part ring rotatably connected with the first-named ring at one side thereof and having its parts hinged to each other, rotatable cutters carried in the second-named ring and protruding beyond the inner periphery thereof, and means on one part of the ring and active on one of the cutters to adjust the same.

2. A pipe tool comprising a pair of coaxial two-part ring members, each having means for holding its members in ring relation, a pair of movable cutting elements carried by one of the ring members, a pair of movable clamping jaws carried by the other ring member, thread cutter element adjustably mounted in the first member, the adjustable mounting including a screw constituting a handle for that ring member, a clamping jaw having an adjustable mounting in the second ring member, its adjustable mounting including a screw constituting a handle for the second member, the ring members being connected for co-axial rotation with respect to each other.

Claims allowed, 2.

DAWSON STAGES A "COME BACK"

Continued from page 16

"Then with the advertisements of Moses Irons fixtures running in the Hydeville press, the idea had somehow gotten out—you know how the public is!—that they were the only fixtures for that Third Ward School.

"That order came in while you were dallying the summer days away at Coney Island—John—or was it Manchester-by-the Sea?

"Dobson was back in the first trench by then, you see. But you wouldn't be satisfied, he knew, unless he went over the top."

"But that high school order was placed," said Renwick.

"Going over the top means you're after the enemy's positions, John. Isn't the 'fresh-air' system an enemy of public good health? The Third Ward school plumbing, not a big job—only 28 fixtures, was installed before school in September, and all Hydeville watched progress on that job. By then the high school walls were only half up.

"Then began the agitation: 'Why install the same thing in our new high school which has been found so insanitary in the Third Ward School?' Of course, the school board had to save its face, if it could, but public opinion is mighty powerful when it finally does get into motion. And though the Hydeville school board tried to buck it for several months, it had to yield at last."

Moses Irons, pulling some sheets of paper from his pocket, laid them in front of Renwick.

"There, John, is the order for Hydeville High School. Roughly, it amounts to $21,000."

"But the original order was for $13,000—"

"The school board had to save its face, as I said; they did so by adding more plumbing fixtures and a swimming pool. Dobson went over the top, John; and the impetus took him quite a ways into the enemy's lines!"

"But all that advertising cost some," objected Renwick.

"Yes, more than it would have cost had the sales department done its duty in the first place. Advertising, John, is the barrage with which an alert sales department prepares the battle field for its salesmen's advance over the top. To attempt a deal like that at Hydeville without such a preparatory barrage is sales suicide."

Renwick attempted to speak, but Moses Irons had the floor: "Hardening of the brain wrinkles is no imaginary ill, but it must not be forgotten that the brains of a sales organization are supposed to centre in its manager. Also this—the public is the ultimate buyer. An appeal to the public—if one has the goods, is pretty sure to be effective."

WILL BE TAKEN INTO PARTNERSHIP

Owing to the sudden death of the senior partner, Mr. W. R. J. Hughes, of the firm of J. W. Hughes & Son, Montreal, the business will be carried on as formerly by his partner, Mr. A. W. Hughes, who has been connected with the firm for over twenty years. Mr. W. U. Hughes, eldest son of the late Mr. W. R. J. Hughes, formerly connected with The Jas. Robertson Co., Limited, will be associated with A. W. Hughes in the business.

MONTREAL NEWS NOTES

P. Mercier, consulting engineer for the administrative commission of the city, is giving considerable attention these days to the new plumbing by-law. While considerable time is being taken to consider this, it is pointed out that the "last word" in an effective by-law is desired, and that no care will be spared to have the new Act cover every requirement. Comment is being invited from the various city master plumbers, for they will doubtless be in a position to express views that are practical and of an advanced nature.

Under Board of Health

The Plumbing Department of the City of Montreal is now under the direction of the Health Department. This change seemed to be a desirable one, the former arrangement placing this section under the care and direction of the Building Inspection Department.

Sanitary inspection is now being made under the direction of A. Cousineau, civil and sanitary engineer, and associated with Mr. Cousineau are P. Connolly and T. Paul. Mr. Cousineau has been giving a great deal of thought to the new by-laws and he has these well in hand, and reports that they will be available by the Administrative Commission for their approval in the near future.

P. J. Carroll, formerly with the Sewerage Department of the city, is now on the staff of the Plumbing Inspector's Department.

Teles Latourelle, president of the Montreal Master Plumbers was chosen a member of the hardware and metals committee of the Montreal Chamber of Commerce.

A Splendid and Worthy Ally

A Man Behind the Men Behind the Gun—Once a Plumber, Now Chief Executive in One of America's Largest Brass Plants—Became Designer of Airplane Flexible Gun Mount—The True Spirit of Co-operation Displayed

IF there is one man interested in the plumbing trade who never says "die" that man is L. A. Cornelius, president of the Canadian Wolverine Co., Chatham, Ontario, and Wolverine Company, Grand Rapids, Michigan.

Readers of SANITARY ENGINEER will recall the two disastrous fires which finally wiped out the Chatham plant soon after the war broke out. But in spite of those calamities, the trade was looked after just the same, and their wants supplied in such a manner as was appreciated.

But as soon as Uncle Sam took up the gauntlet thrown down by the Kaiser, every one of our American cousins joined in the fight with a will that shook every fibre in their bodies. It was a case of every big and little man volunteering his services in whatever capacity for which he was best fitted.

L. A. Cornelius was enjoying a well-earned and needed rest at Biloxi, Miss., and had decided to prolong his stay on April 5, 1917, when he learned that action by the United States Senate made immediate war with Germany inevitable.

On that very day Mr. Cornelius wired Senator William Alden Smith in Washington, offering his services gratis to the War Department as sanitary engineer, and this offer was formally acknowledged on April 17 in a personal letter from Secretary of War Baker.

Mr. Cornelius paid a visit to Washington and practically placed his company's plants at the disposal of the War Board. It was decided that he could serve best through production and development by the companies of which he was the head, and that he should give his attention to aircraft. Aircraft production, as an entirely new and undeveloped art, appealed to the inventive mind of Mr. Cornelius, as did also the fact that the airplane seemed to be the most effective weapon that could be developed; and after much hard work in rearranging the plants, Mr. Cornelius showed in concrete form that he and his whole staff, from the highest official to the humblest laborer, were ready to stand behind Uncle Sam to the very last. So great was the confidence of the War Board at Washington, that an order for 2,000 flexible gun mounts to equip airplanes was placed on Nov. 4, 1917, and by January, 1918, shipments of complete articles were made until the output of 60 complete mounts per day was reached by July of that year.

In the evolution of fighting equipment it was decided early in 1918 to use two machine guns on each mount, and in accordance with cabled instructions from General Pershing, certain changes were needed regarding movements, etc. It was to L. A. Cornelius that this work of designing was given, so great was the confidence that the production engineering dept. of the Bureau of Aircraft had in him, and results proved that this great responsibility was not misplaced. In fact, some of the most delicate parts of guns and gun mounts in connection with airplanes and aircraft generally was supplied by the Wolverine Company.

After numerous experiments and flying tests with various appliances, the company was also entrusted with the delicate task of making the so-called Venturi Pitot tube, which is a direct pressure and vacuum apparatus that is attached to the strut of the machine, and from which small air lines lead to the recording instrument, which is placed in front of the aviator. Mr. Cornelius made quite a number of airplane trips, and inspected many tests himself in actual working conditions. And, while we have tried to tell of some of the splendid work done by our friend Cornelius, we would be altogether remiss if we did not state that all these achievements were only made possible by the fact that every man and woman, from basement to top storey, were one with their chief "all the time, every time."

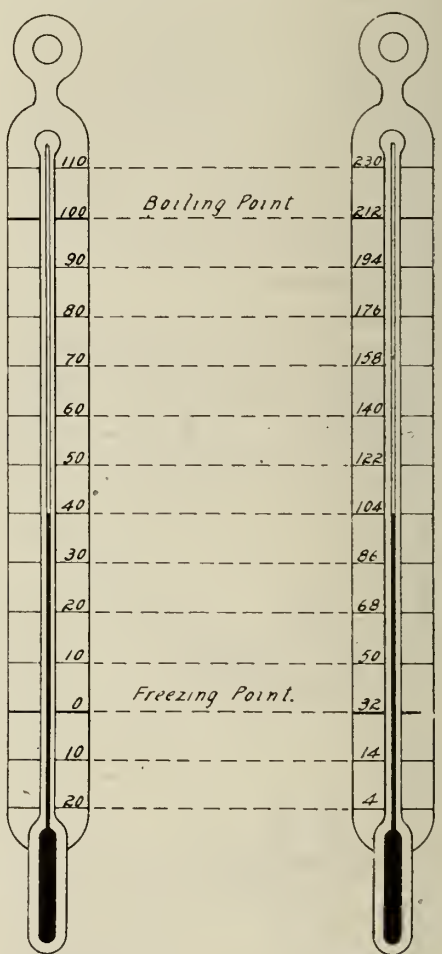
In this connection, the writer would like to relate a story which shows in real life the kind of men employed at this plant.

During a visit in Grand Rapids in the summer of 1917, the writer was strolling down one of the main streets and stopped for a moment to look at a very attractive war-time window display, which consisted of crossed flags of the Union Jack and Old Glory. He, the writer, happened to rub shoulders with an old gentleman, plainly, yet neatly, attired. Said he, "Isn't it grand to see those two good old flags so entwined?" or words to that effect. These remarks began a conversation, at the close of which the gentleman remarked: "Yes, I work for one of the best bosses and the best concerns in all America." That man was one of the boys behind L. A. Cornelius, the president of the Wolverine Brass Industries. That's the spirit that wins, the true spirit of co-operation and unelfishness, human to a degree. Such a spirit as displayed by that old employee is not bought with dollars, but rather acquired through confidence and square dealing. Gun designing, the ability to do things and get things done, money making and all other accomplishments sink into insignificance in comparison with the ability to deal square, to win the confidence of the little fellow under you.

THERMOMETER SCALES

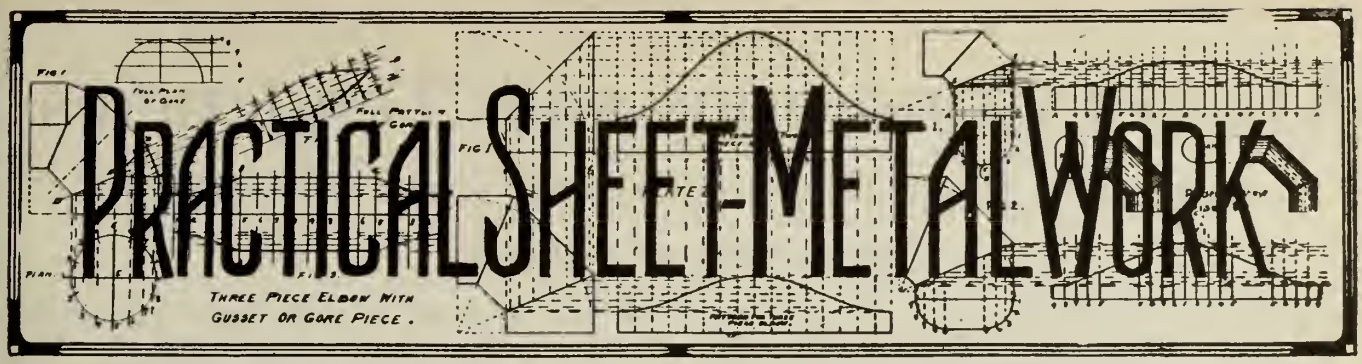
By T. L. Smith

When the term 40 degrees C. is used how does this correspond to the heat in Fahr.? The diagram shown in Fig. 1 answers this question graphically. To the right are shown the Fahr. temperatures, and to the left the corresponding



C. temperatures. From this picture it is evident that a temperature of 40 deg. C. corresponds to a temperature of 104 deg. Fahr.

The H. Mueller Mfg. Co., Sarnia, Ont., have in the course of preparation a 300-page catalogue on water, gas and steam brass plumbing goods. This catalogue is at present in the printer's hands and will be ready for distribution within a few weeks.



BY THOMAS STANSFIELD

IT has often been found that a chimney on a fairly good-looking residence has been too short and an extension piece has been required so as to improve the draft. And a round extension piece has not been quite as artistic as the owner would like, the following article shows what was done in such a case not long ago. The existing chimneys on the house were octagonal, and to make the extension look somewhat in keeping with the rest of the chimneys an octagonal one, with ornamental top, was made to fit the one described herewith; the cap piece will appear in the next article. Herewith is simply the taper piece from square to octagonal, the latter being the centre.

First draw the plane as shown in G H I K, and from I K Aa Bb Cc Dd draw a number of dotted lines, from which the elevation can be drawn. Now extend the dotted lines from centre line L horizontally, upon which the pattern must be developed for the large side; dotted lines Ee Dd must also be extended, cutting same as shown at N. Now place the compass at F in elevation and open to C; this measurement is transferred to N, cutting dotted line at O, and draw a vertical line through point O until points R P are developed. Now draw two more horizontal lines from H and K to R and P respectively.

By drawing solid lines, as shown from N^1 N^2 to R and P the pattern for the large side is complete.

To develop the pattern for the small piece draw centre dotted line L M through point K. Then draw two more lines from Cc Dd to S S, and, by placing compass point at F, opening them up to C, the true length of the small pattern is procured. By transferring this measurement to centre line L M, from short line S S to M, and by joining points S S and M, the pattern for the small piece is completed.

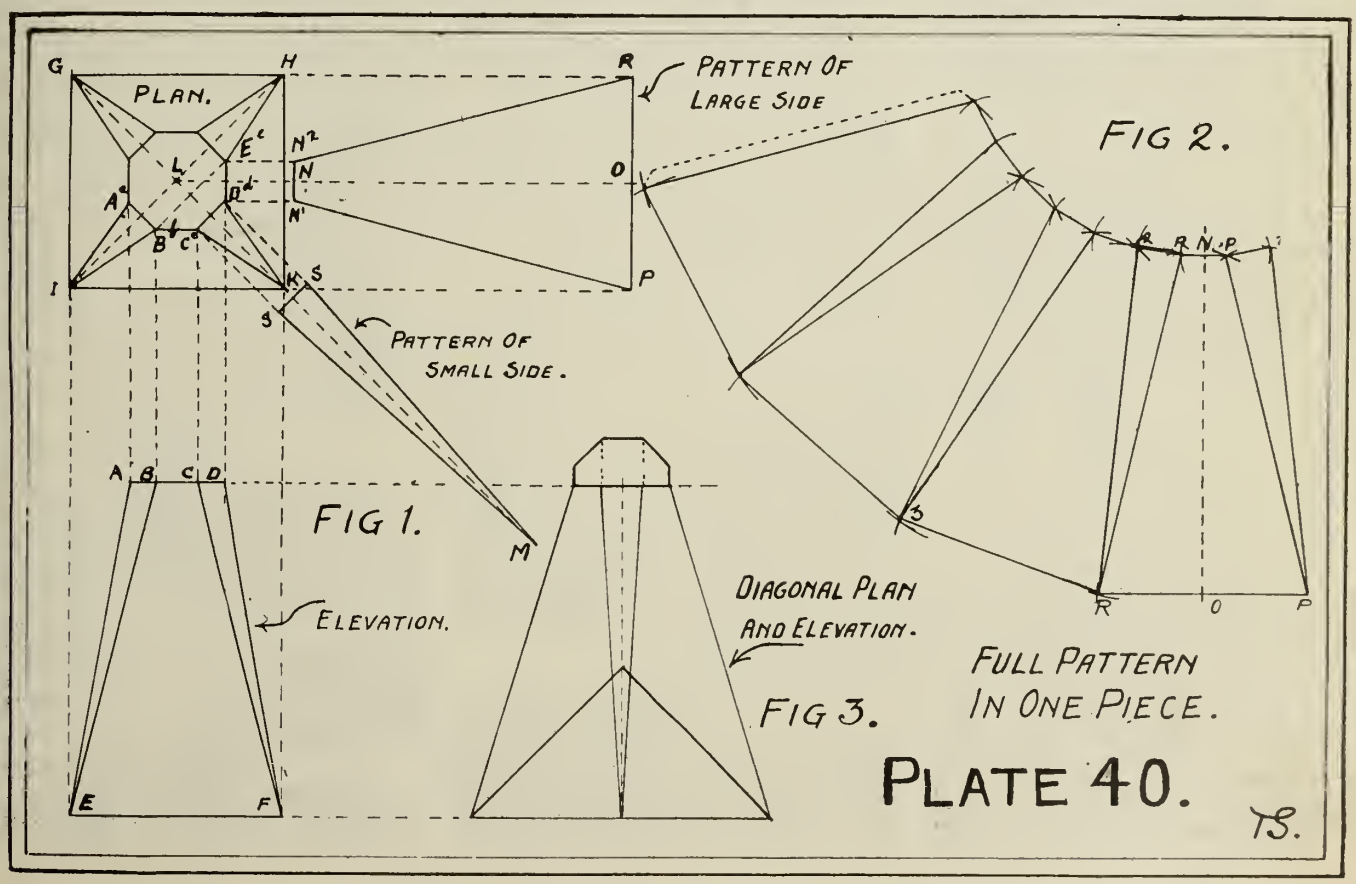
Now turn to the full one-piece pattern, Fig. 2, and first draw a vertical dotted line N O, repeating the instructions given when the pattern for the large piece was being developed.

Next place compass point at P, with P P as radius, draw arc 1, and by using P R at the top as radius, cut arc 1; by joining these points P 1 P the second portion of pattern is made.

Now place compass on lower point R, and with P at top as radius draw arc 2; then with R P at top as radius, cut the arc 2; drawing line from arc 2 to lower R completes the third piece.

The second large piece is now to be developed. With lower R and P as radius, draw arc 3, and again using the lower R and P at top as radius, draw

(Continued on page 32)



Market Conditions and Tendencies

Statements Regarding Supplies and Trend of Prices

THE MARKETS AT A GLANCE

PRICES of plates have been brought to a 5.50c per pound base. This is approaching the best that the warehouses can do. They are now in a position to get the lowest price at United States points, and as this material is put in with the war-price material it brings down the average. There is a feeling that this price will have to come down a shade yet before it reaches a stage where much trading will be done apart from material for actual consumption. There has been a slight recession in the price of black sheets as well, this being a general reduction in some quarters of 50c per 100 pounds. Galvanized sheets remain on an unchanged basis.

In line with information given out last issue, there has been a decline registered in boiler tubes. The present basis is 10 to 12 per cent. below figures previously ruling for warehouse shipments. Both mill and warehouse shipments now take the same basis, the price in favor of the mill business being overcome in the decline just named. Shipments of these are now coming along in good style, and warehouses are assembling a satisfactory stock.

Copper has broken badly at primary points, and quotations named locally are really only nominal to-day. Tin is rather inclined to be weak, with light stocks in evidence and trading small. Lead has declined since last issue and reacted again, and the market to-day is showing considerable strength.

Lead pipe and lead waste have declined 1c per pound, but no new quotations prevail on traps and bends or solder. Manufacturers are waiting to see if lead maintains its upward course. Firmer lead may equalize the weaker tin situation and result in a maintained basis of quoting for some little time on solder.

TORONTO, Feb. 26.—Declines have been recorded in steel plates and black sheets this week. Lower prices have also been named on boiler tubes and some lines of old materials have sagged still further. Tin is slightly easier, while lead, though quoted lower since last issue is on the upward trend again. Copper is very weak. Lead pipe and lead waste have declined.

Basis Same For Range Boilers

RANGE BOILERS.—The basis quoted on range boilers shows no change. There is little business being done just yet and the feeling prevails that a lower basis will have to be reached before much activity can be expected.

	Standard	Extra Heavy
30-gallon range boilers	$14.00	$17.00
35-gallon	17.00	20.50
40-gallon	20.50	24.00
52-gallon	28.00	32.00
66-gallon	37.00	42.00
82-gallon	45.00	50.00
100-gallon	62.00	70.00

Steadiness Shown in Enamelware Markets

ENAMELWARE.—The market rules with a steady tone at an unchanged basis of prices. This is usually a quiet time in this line and there is little trading being done. Quotations on a few of the standard lines are shown herewith:

Bath-tubs, roll rim, 4, 4½, 5 feet, 24 to 30 in. wide	$32 10
Bath-tubs, 5½ ft.	35 70
Basins, flat back, 14 x 15 in.	6 00
Do., corner, 15 in.	5 95
Sinks, roll rim, 18 x 30 in.	15 05
Closets, oak tank and seat	27 00
Do., enamel iron or white vitro tank	29 00

Soil Pipe; Fittings Show No Change

SOIL PIPE FITTINGS.—There have been no new developments in regard to prices ruling on soil pipe and fittings. The market is quite steady and business being done is within rather narrow limits. Cast, malleable and wrought pipe fittings show no further change from recent declines.

SOIL PIPE AND FITTINGS

Cotton Waste Holds; Oakum Steady

WASTE, OAKUM.—There have been no new developments in the situation in regard to cotton waste or oakum. There is a fair amount of business being done and prices are maintained at levels mentioned in last issue.

	Per 100 lbs.
Best American	$21 00-$22 00
Clipper, spun	- 21 00
Do., unspun	- 10 50
Plumbers', spun	10 00- 10 50

Wrought Pipe Situation Steady

WROUGHT PIPE. — No material change has been noted in the situation

on pipe. Manufacturers report some inquiry which may well be expected to develop into orders and outlook is considered very bright for good business when season opens at an early date.

Boiler Tubes Revised Downward

BOILER TUBES.—Lower prices have been named on boiler tubes this week, wholesalers' stocks showing some improvement and the basis being gradually revised to what is now a pretty close price. The reductions average about ten to twelve per cent. There have been two prices ruling on tubes, one from warehouse which was about ten per cent. or so higher than a mill delivery. Now the same price applies all the way around.

BOILER TUBES—	Per 100 feet Seamless	Lapweld
1 inch	$28 00	$.....
1¼ inch	32 00	.....
1½ inch	35 00	28 00
1¾ inch	35 00	28 00
2 inch	40 00	28 00
2¼ inch	43 00	30 00
2½ inch	45 00	35 00
3 inch	52 00	40 00
3¼ inch	.....	47 00
3½ inch	62 00	48 00
4 inch	70 00	60 00

Plates Go Lower; Black Sheets Too

SHEETS, PLATES.—Lower prices have been reached this week on steel plate, and some slight reductions have been made also in black steel sheets. The base price on plates is down to $5.50 per 100 pounds. Warehouse war stocks are pretty well down, and with the new material coming in at the lower level this brings down the average of all the material in stock and the consumer is able to get the advantage of the lower rates. Warehouses are doing a very good business now and with general lines, in some instances February showing an increase over the same period a year ago. Range of quotations to-day follows:

BLACK SHEETS—	Per 100 lbs.	
10 gauge	....	$6 00
12 gauge	....	6 05
14 gauge	6 10	6 15
16 gauge	6 20	6 25
18-20 gauge	6 30	6 80
22-24 gauge	6 35	6 85
26 gauge	6 40	6 90
28 gauge	6 50	7 00
3-16 inch plate	....	5 75
¼-inch boiler plate	....	5 50

Prices shown are for full cases. An extra charge of from 25c per 100 lbs. is made for less than case lots.

GALVANIZED SHEETS—		
10¾ oz.	$8 50	$9 00
U.S. 28	8 20	8 75
U.S. 26	7 90	8 45
22 and 24	7 75	8 30
18 and 20	7 60	8 30
16	7 45	8 00

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

Lead Pipe, Lead Waste Down 1c

LEAD PIPE, LEAD WASTE.—A further decline of 1c per pound has been recorded in lead pipe and lead waste this week, making quotations 12c and 13c per pound respectively. There is still no change recorded in prices on lead traps and bends.

Solder rules at unchanged levels from prices recorded last week and manufacturers report a fair movement in progress. Range of prices to-day follows:

Lead pipe lb.	....	$0 12
Lead waste pipe, lb.	....	0 13
Lead traps and bends	....	Net list
Lead wool, lb.	....	0 14
Lead sheets, 4 to 6 lbs., sq. ft., in rolls, lb.	0 11	0 12½
Cut sheets ½ to ¾c lb. extra and cut sheets to size, 1c lb. extra.		
Solder, guaranteed, lb.	$0 37	$0 39
Solder, strictly, lb.	0 33	0 37
Solder, commercial, lb.	0 31	0 36
Solder, wiping, lb.	0 30	0 32½
Solder, wire, lb.	0 45½	0 50
Zinc sheets, per lb.	....	0 20

Old Materials Revised Downward

OLD MATERIALS.—Lower prices have been named on many items, this being in line with information supplied through SANITARY ENGINEER last issue. Conditions in the trade are quiet and prices named are really only nominal. The basis prevailing to-day is as follows:

Dealers' Buying Prices—		
Tea lead	....	0 03½
Heavy lead pipe	0 04	0 04½
Pipe scrap	....	8 00
Stove plate, per ton	....	10 00
No. 2 busheling	....	8 00
Yellow brass	0 08	0 08½
Red brass	0 13	0 14
Light brass	....	0 06
Scrap zinc	....	0 05
Heavy copper	....	0 14½
No. 1 machinery cast	....	20 00
Wrought iron, No. 1, per gr. ton	18 00	19 00
Heavy melting steel	....	13 00

Lead Firming Up; Copper is Weak

INGOT METALS.—The lead market is showing some strength and prices have moved somewhat from low levels of a week or two ago. Copper is weak and tin is little changed. The feeling prevails that prices cannot get much lower considering costs to-day.

COPPER.—Quotations are really only nominal, the tendency still being downward, with apparently little regard for the cost. Prices named are around 20c per pound, but a lower basis could probably be secured by an actual buyer going into the market. The primary markets have broken badly.

TIN.—There is apparently little stock available and not a great deal of activity is noticeable. Prices rule around 58c to 60c per pound, but may go slightly lower.

SPELTER.—The situation is without any particular feature of interest. Supplies are small but only a fair amount of trading is being done. The price seems fairly steady at around 8½c per pound.

LEAD.—After reaching very low levels the market on lead has reacted somewhat, and 7c is considered a low figure to-day, with 7½c per pound thought to be more in line. There seems to be some inquiry, but trade is still somewhat small.

ALUMINUM.—The sign "nothing doing" still largely overshadows the outlook on this metal. Commercial interests are not buying and everyone seems to be waiting for the other fellow to start. Quotations are nominally held at around 50c per pound.

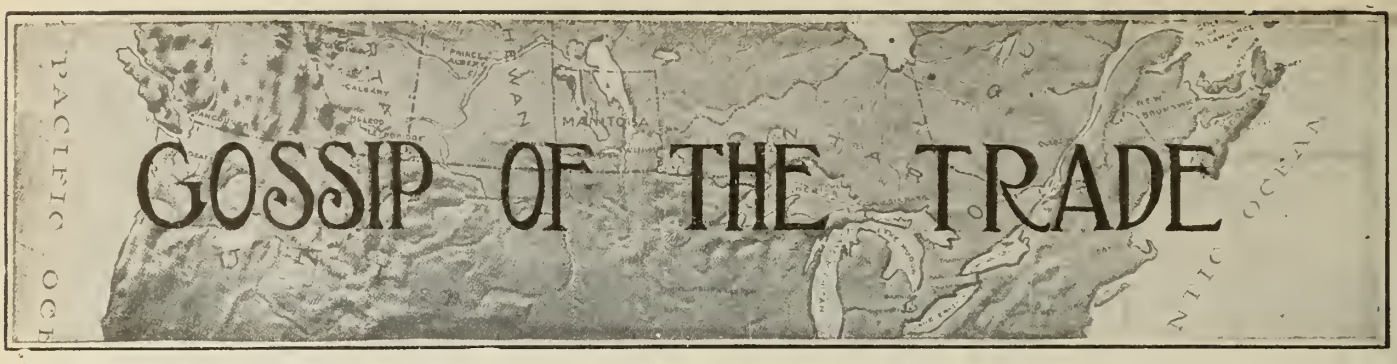
ANTIMONY.—Quietness, in fact dullness, is generally noted as the situation in antimony. Prices have held without change at about 8½c per pound.

NATURAL GAS FOR BOILERS

The San Joaquin Light and Power Corporation recently completed a 26-mile natural gas line to supply fuel to its Bakersfield steam plant. Natural gas is collected from wells in the Midway field and compressed to 250 or 300 pounds per square inch. The joints of the 6-inch pipe line are butt-welded by acetylene, no flanges or screw joints being used. About 6,800,000 cubic feet of gas per twenty-four hours can be delivered, this representing a possible saving of 1,100 barrels of oil per twenty-four hours. The boilers served include four 325 h.p. and eight 603 h.p. units. The gas pressure is reduced to from 0.75 to 2 lbs. at the boiler burners.—"Electrical World."

PIPE BENDER

A new pipe bender manufactured by the American Pipe Bending Machine Co., of Boston, enables 6 in. iron pipes to be bent cold. An illustration shows the apparatus in operation. A 90 per cent. cold bend may be made in a 6 in. iron pipe in 9½ minutes with six laborers handling the lever of the machine. The bends are as perfect as those made by any other process and are made at a labor cost of $1.50, whereas the average charge for making similar bends by other processes is about $25, and several hours are required to do the work.—"Electrical Review," Chicago.



GOSSIP OF THE TRADE

VISITING TORONTO

Ben Noble looked as if he was on the war path when SANITARY ENGINEER met him going into Cluff Bros.' office the other day. But upon referring to the coming convention to be held in Montreal, that honest full face of his simply became one big smile.

He is of the opinion that the convention should have been some time around the middle of April, or some convenient days before the real dry season gets its innings in Montreal. There are others of the same opinion, but let's hope that the novelty of a "dry" Montreal will be sufficient to attract a big crowd to the national convention.

MONTREAL MASTER PLUMBERS

At the last meeting of the Montreal Master Plumbers held in the Drummond Building, St. Catherine St., the membership list was brought up for revision, changes being considered necessary, and it being deemed best to have a good list.

J. E. Walsh introduced a discussion on the matter of the proposal of the Association of Building Industries, that the Master Plumbers' Association should be affiliated with this new association. The matter was briefly discussed and was subsequently left with a committee comprised of Messrs. Hughes, Saunderson, Latourelle, Ogilvie and Ballantyne, they to report later and bring in a recommendation.

Some discussion was also taken up re the Plumbing By-law of the city, and this matter will be further gone into. James Griffin was asked to bring in a report as to a curling schedule for the balance of the season.

VETERAN MASTER PLUMBER DIES IN MONTREAL

With a startling suddenness did the last call come to W. R. J. Hughes, head of the plumbing and heating firm of J. W. Hughes and Son, St. Antoine Street, Montreal. His passing was a shock to numerous friends, for Mr. Hughes had just finished an "end" in one of the successful curling games of the season on Friday, February 14, and, stepping into the apartment of the club house, collapsed, and in a few moments all was over. Although he had mentioned to a friend or two that he was not in his usual form, Mr. Hughes played the game well, and had scored high in his afternoon's playing, some of the best work of the season being put over by him.

A Life-Long Plumber

The late Mr. Hughes was a lifelong plumber. Entering his father's employ thirty-one years ago he engaged with what was originally the Richard Patton business, establish in Montreal in 1861,

MR. W. R. J. HUGHES

The Second Vice-President of the Montreal & District Master Plumbers' Association, who passed away suddenly on Feb. 15th.

and at the time of his first connection, known as Hughes and Stephenson.

After serving an apprenticeship of several years, Mr. Hughes went to New York and entered technical training in one of the leading trade schools. This extensive and technical experience, added to the practical knowledge secured here and at Montreal, fitted him for greater responsibilities, and when his New York course was completed, he returned home and was made foreman of the Montreal shop.

In 1903 Mr. Stephenson retired, and the firm name was changed to that of J. W. Hughes and Son, Mr. W. R. J. Hughes being admitted a partner with his father, the late J. W. Hughes. On the latter's death in 1912 the business continued as J. W. Hughes and Son, and a younger brother, A. W. Hughes, was admitted as a partner, who is still actively connected with the firm.

Having taken a keen interest in better plumbing and sanitation, Mr. Hughes was closely connected with his business, and was recognized as one of the first and most experienced men of the profession in Montreal. He was ever an advocate of superior work, and in speaking with SANITARY ENGINEER last fall he placed much emphasis on the need of all work being done well, and spoke in the highest terms of the importance vested in the modern master plumber.

Many Tributes Paid

Stricken at the age of 48, and a born mixer among his fellow men, it was not surprising that Mr. Hughes' untimely demise should be widely regretted. And among the most marked tributes paid to the deceased is the following from Mr. James Ballantyne, a brother master plumber To SANITARY ENGINEER, Mr. Ballantyne said:

> "There is nothing that I have felt so keenly as the sudden death of the late W. R. J. Hughes. I was talking to him on the morning of his death; he was in the best of spirits, and we were discussing the pleasant afternoon we were going to have with the American curlers, and the banquet that we were both to attend in the evening.
>
> "The late Mr. Hughes was an exceptional man in every respect. I have known him from boyhood, and he had always the same genial, pleasing disposition, and it was a pleasure to meet him at any time, either in business or at social events. He was the personification of uprightness and honesty in business. His word, like that of his late father before him, was as good as his bond.
>
> "We were very closely associated with each other in association matters pertaining to the trade, and his good judgment and advice will be greatly missed in matters of this kind. My heartfelt sympathy goes out to his bereaved wife and family.
>
> "In the passing of the late Mr. Hughes, the city has lost one of its most valued citizens, and I, like many others, have lost a great personal friend."

Out of respect to the memory of their late associate, the Caledonia Curling

Club, of which Mr. Hughes had been a member since 1891, and on a rink from which he was playing on this fateful day, they decided, at a meeting called for the purpose, to close the rink until after the funeral, and not to attend the banquet in the evening. At this banquet, feeling reference to Mr. Hughes was made by one of the visiting American curlers who had met him.

Other Honors Held

One of the most zealous curlers in Eastern Canada, the late Mr. Hughes had several coveted trophies to his credit, among these being the Gordon medal and Governor-General wins. He was also honored some time ago by being elected to the presidency of his club, a distinct tribute.

Ever taking an interest in athletics, and particularly in the younger set, Mr. Hughes was a supporter of the work done by the Montreal Amateur Athletic Association, and of this association he was last fall honored by being elected vice-president.

In his own chosen business, Mr. Hughes took a real interest from the larger standpoint, having held various important offices in the Master Plumbers' Association from time to time. He was a member of St. George's Anglican Church.

There are left to mourn his loss, Mrs. Hughes, formerly Miss Usherwood, and two sons, Lieut. W. U. Hughes, of the R.A.F., and H. H. Hughes.

Mr. W. U. Hughes is being admitted to the firm as a partner with Mr. A. W. Hughes.

RESOLUTION OF SYMPATHY

At a special meeting of the C. S. of D. S. & H. E., under A. Charette, presiding chairman, it was proposed by J. Watson and unanimously adopted, following resolution: "That this executive has heard with sadness the so sudden death of our confrere, J. W. Hughes; that our organization is losing a most esteemed member, the trade a prominent man; that a copy of this resolution be sent to the family of our esteemed confrere as a token of sympathy in their sad bereavement, also to the SANITARY ENGINEER."

A. Charette. Pres.
J. Watson, Sec.

MONTREAL MASTER PLUMBER HONORED

James Ballantyne, of James Ballantyne Ltd., Montreal, was again chosen this year by the citizens of Montreal West, as their mayor for 1919. It was the first time in many years that a contest was held, and after occupying the office of chief magistrate for eight years, Mr. Ballantyne's choice through popular ballot must have been gratifying to himself. His brief remark to SANITARY ENGINEER, when asked regarding the contest, was: "I guess some of the people thought they wanted a change but really did not."

Mr. Ballantyne has endeavored to give of his best for the welfare of this important municipality adjacent to Montreal. He looks for a healthy and consistent growth, and while he does hold to the belief that building activity in his own city, as well as elsewhere, will necessarily be deferred for six months or a year, he expects 1920 to be a winner. He believes that vacant property should, and must be built upon, if the best results are to be obtained and progress made.

NORMAL BUILDING TO RESUME GRADUALLY

Master Plumbers of Montreal Expect Gradual Change to Normal Building Activity—Some Work May Start This Year — 1920 to be Record-breaker — Making Munitions Taught Valued Lessons

PRESIDENT LATOURELLE, of the Montreal and District Master Plumbers' Association, looks for a fairly unchanged condition during 1919, as far as building activity is concerned. Asked as to what he thought of the outlook by SANITARY ENGINEER, and for his views on the new

President Latourelle, Montreal, thinks outlook for new business is good.

proposal for loaning money to municipalities that wish to erect homes for their citizens, Mr. Latourelle believed that there would be, if any, but a partial return to building in 1919. The price of all material was so high, and the inducements regarding building in general were so few, that those wanting housing would defer this, he thought, until lower prices would be available.

"We will take the illustration afforded by the City of Outremont, one of the adjacent sections of Greater Montreal. Supposing that a man wants to erect a $5,000 home. The city of Outremont will probably offer anyone wishing to build, free taxes for five years. These taxes might run about $100 per year. The money investment at $5,000 would mean, in interest, at least $250. Will the price of materials decrease enough to make it worth while to wait? That is the point a man wanting a house would consider, and it would seem that the inducement of free taxes for the period mentioned would not be sufficient to stimulate building. I do not expect there will be a great deal of building before 1920, but then it will perhaps be very active."

This is an interesting viewpoint. Mr. Latourelle did not deny that there might be some new work, but believed that this would be rather limited in view of the high cost of everything, and notwithstanding the great need, particularly for housing.

James Ballantyne's Views

James Ballantyne, one of the leading master plumbers of Montreal, stated to SANITARY ENGINEER that he believed there would not be a general revival of building during 1919, but was hopeful that some of the larger Government work would be undertaken. "The Federal Government is renting extra accommodation at present," said Mr. Ballantyne. "They need more room. Here in Montreal it may be, for instance, that the new Examining Warehouse will be extended." This building is at present but partly completed, that is, a large wing or section is contemplated. Recent rumor has it that this work will be resumed to absorb a portion of available labor not otherwise employed.

Mr. Ballantyne thought that there might be some building in a large way. "Only recently I was asked to figure on an apartment house of over 100 rooms and some work of this nature may be carried out. There is a good demand here for apartment accommodation."

This view was also somewhat shared by Mr. Latourelle, for, "A man can build several apartment sections for very little more than a semi-detached house costs. That is he can get several flats out of the same expenditure, and out of a given outlay could get rentals of $75 to $100 for two or three flats, where the house proposition would bring him much less, perhaps only $40 or $50. These apartments also are popular, many preferring them."

The above all has a bearing upon the plumbing and heating trade—very vitally indeed. It would appear that the trade here is alive to the possibilities ahead, and as Mr. Ballantyne pointed out, "There should be a great revival of building here in 1920; it should be one of the best years ever experienced."

Men More Efficient

One of the observations made by Mr.

Open Fire Places

Editor, SANITARY ENGINEER.—I read in one of the newspapers a few weeks ago that some professor was of the opinion that open fire grates should be placed in workmen's houses, and that such appliances would not only heat the houses properly, but would also ventilate a room or rooms better than a furnace. I cannot figure out how this could be done and would therefore like the question put to you, Mr. Editor, to discuss in your "Question Box." Are there any particular kinds of open fire grates that could be used in Canadian homes that would be more than a mere toe-toaster or face warmer?

O. G. Inquirer, B.C.

We are not aware of any type of open fire grate that would be suitable for heating homes in all parts of Canada. It may be that, in certain parts of British Columbia, where very little frost is experienced, open fire grates can be advantageously used, and particularly those that contain water backs or coils, similar, for example, to those manufactured by Jas. D. Prior, Empire Works, Birmingham, and others.

These open fire grates are made in a score and one styles, with coils or cast water backs. They are filled with water, an expansion tank is fitted to same in just the same way as a regular hot water heating system. Radiators can be connected up to these grates and placed in small bedrooms, or even in the same room in which the grate is fitted. They hold a larger body of coal, and the flues in the chimney are properly controlled.

But, after all, nothing will take the place of the furnace as a 24-hour heating unit in the average Canadian home. It may be that smaller-sized furnaces will be made, particularly the warm air type. We believe that the workman has just as much a right to have his house efficiently heated with a small furnace as any other class of individual, and we hope to see the small hot water system or reputable kind of warm air furnace installed in the usual way in most of those houses which are soon to be erected to fill the urgent present need.—Editor.

Cheapening Plumbing

Editor, SANITARY ENGINEER,—The present housing schemes that appear to be "in the air" have in them, it seems to me, an element of danger, at least regarding that portion of the make-up dealing with plumbing and heating.

In a recent issue of SANITARY ENGINEER you warned the trade not to be carried away with the main idea of dollars and cents in connection with first cost of plumbing, if the cost in cash came to such a low level as to mean that a poor class of plumbing fixtures and piping would have to be installed, resulting in creating unsanitary conditions later on.

I was looking over a blue book just recently issued by the Ontario Housing Committee, and under the heading of plumbing I noted that this committee suggested some very radical changes in the methods at present looked upon as standard all over Canada.

For example, on page 40 in the book I refer to, and under Section 8, referring to vents. the following appears:

"The bottom of a vent stack shall also be joined to soil or waste stacks below the lowest fixture connection."

There are other matters which I feel can be subject to criticism, but I would like your views about the above suggestion, which, it seems to me, would tend to make plumbing much more expensive. I am hoping to see some plans worked out that will cheapen plumbing construction, providing that the work does not later become a menace to the health of our workmen, or become a big bill of expense in repair work afterwards.

O. W. O. For True Sanitation

In the first place it might not be out of order to state that the Ontario Housing Committee have already been approached in an indirect way by SANITARY ENGINEER and that it has learned that the suggestions referred to have all been withdrawn. But to give our reader a reply to his query regarding connection of the vent stack to the soil and waste stack below the lowest fixture, we would state that this is no doubt good practice. It is very desirable too, in many cases, but we are discussing workmen's houses, houses not to cost more than $3,500 including land, and it is proposed to allow workmen 20 years' time to pay for the house, so that it would be well to view this question from all angles. SANITARY ENGINEER is prepared to endorse cutting out any piping that verges on the point of expense that is not absolutely necessary, and in this case we do not feel the necessity of running a separate pipe from, say the vent branch above the water level of the lavatory at the bathroom to a point below the sink waste pipe, even though this may only mean connecting the top of the sink trap vent to the higher branch above-mentioned. Therefore, we would feel that the vent connection referred to in Section 8 is really not necessary.—Editor.

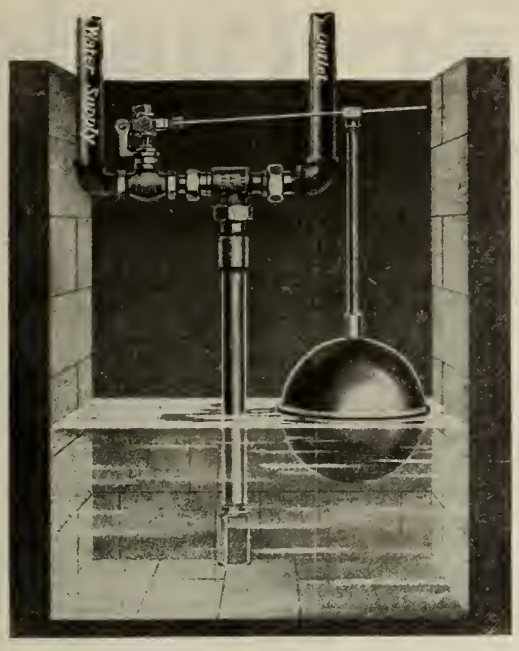
THE PLUMBER

A plumber is a busy man, especially when it freezes,
When the mercury drops down below and everybody sneezes,
When water pipes are frozen tight it puts things on the hummer,
You want the man there with the wrench; the man they call the plumber.

With lighted candle in his hand, he gropes about the place,
Through cobwebs old and dusty, to try and stop the waste.
A piece of pipe is broken, a trap, a bibb or two;
It takes just three full hours for him to fix up for you.

You're only one of many who want him right away
To hustle on and off the job—but when it comes to pay—
He was longer than he should have been; so cuss him up and down
But then, at that, what can you do—they're all the same in town.
This is your opinion of your plumber; but if you only knew
It might be a liberal education what your plumber thinks of you.

PETE FUSS.



"Morrison" Cellar Drainers

—are guaranteed to give service too severe for other drainers.

The operating limits of most types of cellar drainers range from 15 to 18 feet lift. The Morrison cellar drainer will lift as high as 30 feet at 60 lbs. pressure. *"Morrison"* Cellar Drainers are automatic in operation, dependable, and require no attention when once adjusted.

All working parts above water. Nothing to get out of order.

"The Heating Contract is Yours Mr. Jones"

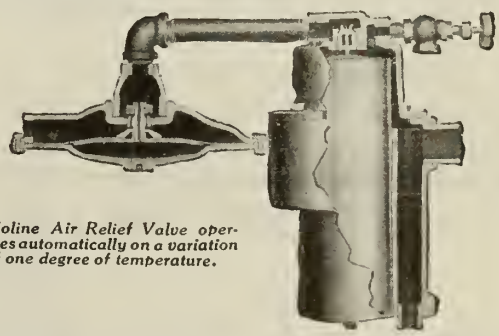
HEATING CONTRACTOR JONES (smiling): "If you don't mind my saying so, gentlemen, I *knew* I would get your contract as soon as I mailed my bid."

All the Committee, together: "What do you mean by that, Mr. Jones?"

Jones: "Well, Gentlemen, I knew I'd get it *because my bid was made on Moline Heat.* I knew that you gentlemen wanted *quality* in the building you are putting up and that it was not a matter of 'the cheapest bid wins.' Like all wise buyers, you want *quality first.* Wasn't I right?"

Chairman: "You're exactly right on that, Mr. Jones. The clinching arguments, to our minds, in favor of Moline Heat installation, were these attested statements you submitted from owners of buildings in every part of the United States, testifying to the *permanent* satisfaction given by Moline Heat. We cannot tolerate any heating troubles in our building after installation. And you have proved to our satisfaction that wherever Moline Heat has been installed it has given unvarying perfection of service."

Jones: "Thank you, gentlemen. When Moline Heat goes into your building, your heating worries are over. I have never installed Moline Heat anywhere without gaining other customers for it."



Moline Air Relief Valve operates automatically on a variation of one degree of temperature.

Numberless other heating contractors have had the same experience as Mr. Jones. YOU deserve as much success as other heating contractors. Climb on to the success wagon!

The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH

Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with wood handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

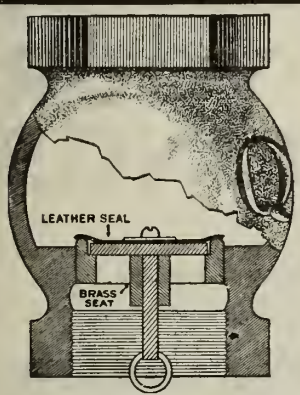
Over 60,000 Daisy Hot Water Boilers Now in Use—Are *You* Selling Your Share?

Daisy Hot Water Boilers are easiest to sell because they have an established reputation for exactly meeting the requirements of the modern home.

Every Daisy you instal will help build bigger business by bringing repeat orders for installation in neighboring homes later.

WARDEN KING Limited, Montreal

BRANCH OFFICE: 136 SIMCOE ST., TORONTO



This is a "Q" Foot Valve

And it Just *CAN'T* Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

"do you use the whip?"

—brought into play by a good business letter writer, the "whip" is surprisingly effective. It holds the attention of the reader. It urges him to immediate action. "Certainly fine—has made many dollars for us," writes the Freemont Cash Store. Are you using the "whip" in your letters? If not, see page 67 of "How to Write Business Letters." This practical work was produced after a careful study of more than 1,900 letters—some unusually successful, others partially so, and some which failed in their purpose. This book tells why they were successful or why they failed. "How to Write Business Letters" takes the actual everyday correspondence you receive and shows you specifically how to answer it with the best results. Shows you with reproductions of actual letters that have sold goods, collected accounts, increased trade and prestige for some of the shrewdest correspondents in America. Here, too, are reproduced whole series of follow-up letters that have won countless dollars in additional profit. A careful reading of one of the series alone may give you new ideas for your letters worth thousands of dollars. The plan of the book may be judged from the following headings:

—Writing a letter that will stand out from the mail.
—Letters of introduction, application, recommendation and reference.
—How to answer complaints.
—How to word an offer and get quick action.
—Handling collections by mail.
—How to make your first paragraph "take."
—Simple and easy explanation.
—Making a proposition get to your reader's inmost motives.
—The make-up of a business letter.
—Inquiry and contract letters.
—Purchasing letters
—Acknowledging orders.
—Making your statements "stick."
—Brief and well-worded final paragraphs.
—What a sales letter must do.
—Arousing your reader's eager interest.
—How to make argument and proof carry weight.
—The touch of news that snaps up the form letter.

It isn't necessary to tell you that letters are vital to your business. You know it. If they are "forceful," live, diplomatic, powerful, larger returns are sure to result. This book tells how to make them so. The price is only $1.50 for this 160-page illustrated book.

"Did we land that contract, Fred?"
"You BET we did, and it's the biggest job let this year!"

"FRED, you and I have been partners in the heating contracting business for fifteen years now; but did you ever stop to think what a partner MOLINE HEAT has been to us?"

"You said something, then, Bill! Remember, back in 1910, there were four other heating contractors in this territory and we were getting only about one-tenth as much business as those four?"

"Sure! That was the year when that MOLINE HEAT representative came along and showed us what *quality* in heating installation can do."

"Well, we fell for his arguments, didn't we? And what happened?"

Moline Anti-Syphon Seal

Takes the place of Automatic Traps.

"I've been checking up, just this morning, on that very thing, Fred—our record since 1910. Do you know, it's a fact that within one year from the time we began installing MOLINE HEAT we were getting more heating contracts than all the other four contractors put together?"

"Yes, and since 1911 we have handled *almost every heating installation in this territory!*"

"Fred, we can bet our last dollar on this—MOLINE HEAT is the best business-getter a heating contractor ever had!"

Many heating contractors, all over the United States, have had similarly remarkable records since handling MOLINE HEAT. If you wish to know how it's done write to us today.

Some excellent territory still open for special sales representatives.

Moline Illinois

First Cost *versus* Upkeep Cost!

The purchase price means nothing if the upkeep cost is not low.

The purchase price of King Boilers is no more than the average boiler and yet—

The consumption of fuel—*the upkeep cost* is lower—considerably lower.

The thin, peculiarly shaped waterways in the "King" mean quickly heated water and perfect circulation, which causes a saving in fuel because it obviates the necessity of "extra firing" to move cold water from the radiators.

The Trade should use this quick-heating, fuel-saving argument now while fuel is scarce and high in price.

"The Mysterious German Onions"

On nights when the German air raiders were out, they sent up strange, luminous balls behind their lines and anchored them above the clouds—globes of fire which could be seen for forty miles or more. What these "onions" were, or how they were kept in stationary position above the clouds, is still a profound mystery. The Allies never learned anything about them, but the Allied night bombing crews steered their course to the Rhineland by the luminous buoys thus provided.

What is known about the onions is told by Lieut. J. Vernon McKenzie in the course of an article, "Raiding the Rhineland," in MARCH MACLEAN'S. It is an intensely interesting article, telling all about the great reprisal campaign which implanted the fear of war in the German civilian heart.

"NO HOPE FOR THE WETS"

"Already the temperance forces are lined up to stop any possible break in the prohibition dam," writes J. K. Munro, in discussing what is going to happen at the coming session at Ottawa. He predicts that Union Government will hold together, but that the habit it has contracted of promising everything asked is going to make a lively session. He expects:

Dry legislation at the earliest possible moment.
The moral reform forces in control.
No change in the Divorce Law.
Tariff concessions made to the West.

The March number, in fact, is full of live, up-to-the-minute features.
The famous Canadian Ace, Lieut.-Colonel W. A. Bishop is on the cover.

Some of the outstanding articles and stories are:

The Transformation (a new serial)—By Frederic S. Isham.

BUILDING BUSINESS

Building business is showing marked signs of improvement. The improvement will be gradual and it may be some time before we return to the conditions which existed prior to the War, but all along the line from the Atlantic to the Pacific there is evidence of a renewal of building activities.

Governments, Municipalities and Housing Committees are directing their attention to the insistent demand for moderate priced dwellings, and plans under consideration may take shape at any time; in fact it is confidently expected that large building operations will be under way within a month or two.

It may surprise some of us how quickly we will return to normal conditions in the building line, and in the meantime there is the demand and we who manufacture, distribute and instal Plumbing goods should get ready to take care of the business. There is no better way than by systematic advertising, and whether the medium is through the newspapers, periodicals or other literature, you will find that your advertisement will be more interesting if you use illustrations of attractive bath-rooms, kitchens or laundry equipment.

As Manufacturers of Plumbers' enamelware doing business through the recognized Jobbing and Plumbing trade of Canada, we offer our assistance and will gladly take part in any advertisement campaign that may be inaugurated, and to every Sanitary Engineer conducting an advertising campaign we extend the use of any of the illustrations which may be found in our Catalogues or Booklets. When you find the illustration you think best for the purpose you are going to use it, write us and we will gladly send you an electro by return mail free of cost.

VOL. XIII. MARCH 15, 1919 No. 6

Water Supply and Sewage Disposal

What it is Composed of—Different Kinds of Water—How to Filter Water—How to Store it and Raise it to Faucets—Quantity Per Person Defined, Showing Why Small Sewage Disposal Systems Must be Based Upon the Number of Persons Residing in a Rural Home

By One Of Us

WATER is composed of various elements, compositions, etc., because it is very much influenced by the kind of earth, rock or strata through which it flows or percolates. Let us take for example water procured from chalk springs. It will be found to be, as a rule, pure and wholesome, clear, sparkling, and of a slight bluish tint, and contains from 6 to 20 grains of mineral matter per gallon; and it is what would be called "hard," but softens considerably when boiled.

Now, with water from limestone and gypsum strata, though such water is "hard," it softens less when boiled and is not as wholesome as a beverage as "chalk water," though it is generally very clear and sparkling.

Water from gravel and loose sand is only as pure as the surroundings, for example: If a small sewage disposal system is located near to a water supply, and the system comprises a cesspool or leeching pool, the chances are that the water will be contaminated, though it may even be clear and sparkling and not unpleasant to the taste, yet it may be really nothing better than a slow poison.

Thus it is very necessary and desirable to have a septic tank as part of a sewage disposal system, rather than a cesspool, and once a good water supply has been procured, it is almost a sacred trust to keep it pure, because, without doubt, both pure water and pure air are the basis upon which all life exists.

There are too many people in our rural districts who are of the opinion that when sewage and other domestic washes are put "out of sight," they are "out of mind." This is wrong, and there are laws which prescribe proper methods of sewage disposal.

Water Can Be Purified

Water may be purified by filtration. It can be made to percolate through various porous substances, such as sand, gravel, charcoal, but where large quantities of water are to be filtered, either a very large filtration is necessary, or else some practical means of thoroughly washing the material through which the water is filtered.

Many persons hold the opinion that if a sufficient quantity of water is filtered for drinking purposes, that is all that is necessary. But such is not the case. It has been proved that water that contains certain bacteria, or even chemical properties, is harmful to the skin. When the body perspires, the pores open and skin diseases result.

Then there is need for water for cattle, which should be just as free from impurities as that necessary for human consumption.

Quantity of Water Per Person

As cleanliness cannot be defined in any concrete terms, it is rather difficult to set hard and fast rules as to how much water would be required per person to enable one to maintain a healthy condition in a whole household. But from actual observation it has been found that the quantity used largely depends upon the type of water supply system used.

For example, in some cottages, without water closets or baths, for which water is got from a hand-operated pump at a well, as low as 4½ gallons per person has been found to be the quantity used, with very imperfect cleanliness as a result. On the other hand, under the same conditions, where persons were more clean in their habits, as high as 7 gallons of water per person per day was used.

This subject, or rather that department of the subject of water supply relating to consumption, has been given a great deal of study, and it is now acknowledged by most authorities on this subject that 15 gallons of water per person per day would be a fair average as the requirements for a household, not, of course, allowing for any waste. This quantity to be divided under six headings, as follows:

Purpose	Gals.
For drinking and making tea, etc...	½
For cooking purposes	1
For laundry and clothes washing...	2½
For washing dishes, etc.	2
For water closet	4
For washing and bath	5
Total	15

But in Canada we use a great deal more water than that, and we waste a lot, under the guise of cleanliness. We do not value it except in rural homes, and, as stated earlier in this article, the quantity of water used depends upon the system of water supply adopted.

In rural homes it has been found that where a small hand-operated pneumatic water system is used, as low as 10 gallons per person per day is consumed. which quantity would allow a fair condition of cleanliness to be maintained.

Where a gasoline-driven pneumatic water system was in operation, a still larger quantity of water is used. While in cases where an electric driven and automatic pneumatic water system was used, as high as 50 gallons per person is sometimes consumed, or, at least, the pumping outfit delivers that quantity.

These conditions are brought about because of the fact that as the water requires less manual effort, it is used more freely. Not in every case with a view of greater cleanliness, because there are no degrees in cleanliness. A thing, or a person, or an animal, is either clean, or it it is not clean.

Sewage Disposal

Now, we will take up the question of sewage disposal, or rather, show what relationship there is between a water supply and a sewage disposal system.

Suppose that a small farm house is to be fitted up with a bathroom and kitchen, with hot and cold water at the various fixtures, bath, W. C., wash basin and sink. The reason we do not, in this case, include a laundry tub is because most laundry tubs are installed in the basement, and in that case it would be difficult to drain the laundry tub with a septic tank. unless by pumping the waste water to the higher level; though this may be done if room permits.

Suppose, for example, then, that a hand system was used, and four persons resided in this small farm house, 40 gallons, or, at the most, 60 gallons per day of water would be used. This water is all to be disposed of, plus any solid matter it may contain, which we know is not very much, and is so uncertain in quantity, that we need not take it into our

calculations. Very well, we are to dispose of, say 60 gallons of waste water or fluid, and the disposal system must take care of this waste, therefore, it will be seen that there is a relationship between the water supply and the sewage disposal system.

An ordinary septic tank, as most of our readers know, comprises receiving chamber and a dosing chamber. The first should be capable of holding one-half more than the latter, and, therefore, must be either deeper or longer than the dosing chamber. Let us then suppose that we must dispose of 60 gallons of sewage per day; remember, we stated "dispose," not merely "put out of sight." The first, or receiving chamber, is directly connected to the soil waste and drainage pipes, and should be capable of holding 90 gallons of fluid from the soil pipe to the bottom of the tank.

The dosing chamber, in which a syphon is fitted, should be of such a size as would permit 60 gallons of waste to automatically discharge, at most, every 24 hours. The average 3-inch syphon will discharge all the contents of this chamber to within 3 inches of the bottom of the tank, so that the tank would require to hold 60 gallons plus 3 inches at the bottom, from the high level to that point below.

Subsurface Pipe

Now, as to where this discharge should go to, many persons advocate that one lineal foot of 4-inch clay field tile pipe is sufficient per gallon of discharge, particularly when the ground is sandy loam or gravel. But the writer is of the opinion that such is not quite practical. For the purpose of explaining why such an opinion is erroneous, it should be remembered that a 3-inch syphon discharges not less than 80 gallons of fluid per minute, and some discharge as high as 90 gallons per minute. Now, if one foot of pipe is provided, only 90 feet at the most would be installed in the ground. And it would require 12 lineal feet of 4-inch pipe to hold one cubic foot of sewage, so that on a basis of 6½ gallons or so per cubic foot, one foot of pipe would only take care of ½ a gallon. No doubt, if the syphon discharged very slowly, and allowing for a certain amount of the fluid escaping through the porous soil, less than 2 feet of the pipe per gallon would be sufficient, but when we consider the rate of discharge, which is very desirable, too, it is always safe to provide sufficient pipe to take care of the whole contents, or, say, in this case, 60 gallon discharge. Therefore, in this case approximately 130 lineal feet of 4-inch pipe would be required. And it is safe to use such a rule for all sewage disposal systems.

Then there is the question of depth underground to which these pipes should be laid, and the nature of the soil that is suitable for such a system. Of course, the most desirable kind of soil would be sandy loam or gravel, with a light top soil of a few inches. And where such conditions exist, the pipes should not be laid more than 14 inches deep; that is a safe plowing depth. Where soil is inclined to be clayey, the trenches should be from 14 to 18 inches, and as much top soil and light sand and gravel procured to fill same around pipe as possible. In a case like this, the trench may be dug, say 20 inches deep, and a few inches of lose filling, broken stones, pebbles, coke, etc., laid in first; then the pipes should be placed in position with open joints and rough material laid over each joint to prevent the finer particles from washing into the pipes at the joints; then the pipes may be covered with the top soil, or other loose material that can best be locally procured. But on no account must clay soil alone be depended upon to absorb wastes from a sewage disposal sysinches deep, and a few inches of loose fillup the trenches, and flow, if at all possible, to a lower level, which may very possibly be the well or source of water supply.

To safeguard the source of water supply, it is always recommended that a sewage bed be laid as far away from a water supply as possible, and in such a way as to have all discharge flowing in an opposite direction to the location of the water supply. In conclusion we will show some of the most important matters to keep in mind when installing a sewage disposal system and septic tank.

First, that the septic tank itself does not dispose of sewage; that it is only a part of a sewage disposal system.

That the septic tank is made of concrete and should be absolutely water tight.

That after the tank has been built, a thin coating of special mixture should be made and plastered on the inner walls of the tank.

The mixture to be made up of 3 parts clean, sharp sand to 1 part cement, and that the sand should be first dampened with boiled oil by using about a quarter of a gallon to a pail of sand; then mix sand with cement and add water till the whole is about the consistency of plaster. Apply with a trowel quickly.

The sewage disposal pipes should be laid as level as possible, the main trunk line of pipes should be 4 or 6 inch glazed tile pipe with hub and spigot, and all these joints be made tight by caulking a small ring of oakum in first, then using cement and sand putty to fill out joints.

That not less than 2 lineal feet of 4-inch field tile pipe be allowed to each gallon of discharge, or 13 lineal feet to every cubic foot.

That if soil is clayey a special bed be prepared as described above.

That the most desirable kind of soil is sandy loam or gravel.

That septic tanks should in all cases be fitted with a water-tight cover and manholes in each tank.

That cast iron fittings for septic tanks are best, and less liable to breakage, and better and stronger joints can be made.

PROGRESS REPORTED BY ONTARIO HOUSING COMMISSION

The Ontario Housing Committee has issued a preliminary set of regulations to govern the standard of workingmen's homes. which, it is thought, the province may build.

The part of the plans of greatest interest to the trade is that the committee has declared itself against the English system of putting the bathtub in the scullery or kitchen.

Special attention is to be paid to insure a fresh air space at front and rear. Cellars are not encouraged, as being unnecessary and likely to become a place for rubbish and litter to collect. The committee is greatly in favor of detached houses, and emphatically against the tenement for which they declare there is no necessity in this country, and only gives a qualified approval of the Duplex group.

The houses are to be made as attractive and as compact as possible, as the work usually falls entirely on one woman. They are in three styles; four, five and six room houses. Of these, the six room contain three bedrooms, and the others two and one bedrooms respectively. The other rooms, in each style, are the living room or parlor, dining room, kitchen, and bath. The Board do not object to the combination of the dining room and kitchen to provide an extra bedroom, or of the dining and living rooms, so long as all three are not combined.

INTERNATIONAL MALLEABLE BUILD NEW FACTORY

At the meeting of the directors of the International Malleable Iron Co. held at Guelph last week, they decided to proceed at once with the erection of their new factory for the manufacture of pipe fittings for foreign and domestic trade. The building on which construction will be started as soon as the plans are confirmed, will be 160 by 60 feet, and of three stories in height. This building is but an addition to an already large plant.

BRIDGEBURG TO COPY GRIMSBY

The new settlement basin at Grimsby has proved satisfactory and dependable in every way. Mayor W. T. Malkin and Reeve J. H. Atwood, of Bridgeburg, inspected the basin recently, and are thinking of installing like equipment at Bridgeburg at a cost of about $4,000. A short time ago electric pumps were installed in the municipal pumping station, but they have been handicapped, owing to the fact that weeds, small fish, etc., from the Niagara River periodically blocked them. The proposed basin is expected to overcome this.

Wisconsin Apprenticeship System

One of the Most Important Problems of the Day — A National Policy is Necessary— Wisconsin, U.S.A., Adopts Some Very Practical Methods Under the Direction of an Industrial Commission

Published in bulletin form and issued by the Industrial Commission of Wisconsin, Madison, Wisconsin, 1919

INTELLIGENCE and skill among industrial workers is the basis of both good citizenship and national prosperity. The education of men and women engaged in industry is a matter of vital concern to the state. Any plan to train the youth of the state with a view to produce a generation of skilled and intelligent workmen is of paramount interest to the public. It is to further this public interest that the apprenticeship law, Chapter 133, Laws of Wisconsin, 1915, was enacted. This bulletin is issued to describe the apprenticeship program adopted for the plumbing trade in the State of Wisconsin under the law. It is intended primarily for the trade so that a clear presentation may be had of the law, the machinery, and method of its enforcement, together with the rules and regulations which have been agreed upon by the Wisconsin Plumbers' Apprenticeship Board. There is every reason to believe that the new plan of apprenticeship to which this bulletin is devoted will, if consistently followed, afford the plumbing apprentice a favorable opportunity to master plumbing essentials, and will make for more skilled craftsmen, foremen, superintendents, managers, and master plumbers of the future, and thus serve the best interests of the plumbers and the public which they serve. What is accomplished in this particular trade can, in principle, be arranged for other trades, particularly in the building line, because, although details may differ, the fundamental conditions are the same. It is hoped that this bulletin may be of service to the master plumbers, the journeymen, and all others interested in apprenticeship, and moreover, be of service to other industries.

How the Public Will Benefit

A proper apprenticeship system, carried on efficiently and continuously, will develop a generation of trained plumbers worthy of succeeding the journeymen and master plumbers of the present. As a result of improper selection of apprentices and lack of sympathetic direction and helpfulness toward the apprentice by the master and journeyman plumber, a low grade of apprenticeship has been the rule, resulting in most instances in a correspondingly low grade of plumbers. This condition of affairs has proved a costly experiment—not only to the plumber, but to the general public as well.

To have proper training for one's life work pays not only in dollars and cents, but in self-assurance and honest pride, in the knowledge of skilled work and competent service performed. The untrained and the misfit apprentice tends to lower the standard of plumbers and plumbing, and ultimately means the decline of that reputation for superior service which the general public has a right to expect.

Wisconsin is the pioneer state in recognizing these needs. This state in 1915 passed a law providing for the indenturing of apprentices in all recognized trades, and this law is only a part of more general legislation which provides for compulsory vocational training of all industrial workers under certain ages. Even the federal Government has enacted a comprehensive law for the promotion of vocational education and has appropriated millions of dollars, increasing in amount for a period of ten years, to supplement state and city expenditures for this phase of education.

The result looked for is the elimination of a condition which to-day leads to one out of five apprentices in the plumbing trade leaving it before acquiring sufficient skill to become of real value to the community.

General Conditions of the Plumbing Business

Plumbing is one of the well-known building trades. It is a trade the product of which is stationary. The product of a plumber's work cannot be transferred from one community to another or from one state to another, but must be performed upon some building and performed at its final destination. In other words, the work of a plumber connects directly with the good or the evil, as the case may be, of the community in which he works.

The plumber deals with metals and sanitary fixtures chiefly. He must, however, be very adept in the use of tools, and the work is such, if properly performed, as to demand a high grade of intelligence and skill.

Modern plumbing is a great factor in maintaining and extending the hygiene of the home, and contributes to the maximum comfort of those who enjoy its advantages. It is now recognized more than ever before as a necessary sanitary improvement in the home, office, and factory. On the other hand, insanitary installations are inimical to the health of the public, and so vital is the work of a plumber that its neglect may mean the spread of disease and sickness such as to jeopardize the lives of thousands. For instance, a plumber must deal with the installation of water supply, and who can underestimate in this age the importance of adequate and wholesome water supply?

No less important is the problem of sanitary drainage and all work which a plumber performs pertaining thereto. In no branch of mechanical science has there been more noteworthy progress than in general plumbing, particularly with reference to water supply and drainage. Once regarded as incidental features in connection with building construction, these problems are now considered as items of extreme importance, requiring for design and installation the efforts of specially trained artisans, having the ability necessary to impart to others the fundamental principles underlying the design, construction, and care of installations.

The realization of this condition has made a technical education a necessity in the plumbing and domestic engineering field. There was a time when all that was required of the workman was a knowledge of handling tools and connecting pipes. This, however, is no longer the case, for an intelligent public, appreciating the disastrous results which may accrue from defective work, now insists that all sanitary work must be performed in accord with scientific principles. These facts have forced the state to see the necessity of proper apprenticeships in so vital a trade. Not only must the state and municipalities make regulations and ordinances to protect the public against improper plumbing, but there must be also a system of education which will create better plumbers and train the youth in this trade so that they may be an asset to themselves, a boon to the community, and a pride to the state, and not a liability to anybody. It is with this end in view that the apprenticeship system has been instituted and organized, and it is with these results in mind that we hope the trade will co-operate with the state to the utmost.

The Apprenticeship Plan

A solution to apprenticeship cannot come where either one or the other side of the trade assumes exclusive control. Apprenticeship controlled entirely by the employees, or the union, is bound to meet with dissatisfaction on the part of the employers, if not of the boys. On the other hand, apprenticeship controlled entirely by the employers without regard to the rights of journeymen in the trade is likewise sure to bring unsatisfactory experience. This has been borne out in the past, and the twenty years of discussion

in trade associations in the plumbing business have revealed the decline of proper apprenticeship in the trade, and have also brought to light the troubles which arise when either the union or the employers attempt alone to govern apprenticeship. Effective administration of apprenticeship must come through joint control, and that joint control is best assured when the state takes a hand and administers the regulations with the interest of the public at heart. This interest is chiefly in the welfare of the apprentice who is to be the future tradesman.

In the interest alike of the public, of masters and journeymen, the apprenticeship law, Chapter 133, Laws of Wisconsin, 1915, was enacted. This Statute is based upon two fundamental principles, one that there shall be neutral control over apprentices, and the other that apprentices in the trade shall have their agreements in writing. The first principle is established by the fact that the Industrial Commission is given the "power, jurisdiction and authority to investigate, ascertain, determine and fix such reasonable classifications and to issue rules and regulations and general or special orders as shall be necessary to carry out the intent and purposes of section 2377 of the Statutes." The second principle is established by the fact that the law requires all learners of any trade, craft, or business who are minors to enter into a written agreement. This written agreement contains the conditions of the apprenticeship stated thereon, a copy of which is to be filed with the Industrial Commission at Madison.

The law requires the signatures of the parties to the contract, the date of beginning apprenticeship, the period of duration of apprenticeship, the processes or parts of the trades to be taught and practised, the amount of wages to be paid, and any other special arrangements which are customary in the trade. The law requires furthermore that the apprentice shall attend an apprenticeship school for supplementary trade instruction five hours per week on the employer's time, where such schools are established. It is required by law that such schools be established in all cities over 5,000 and may be established in cities under 5,000. These schools are supported entirely by public funds. They are designed to give academic trade instruction to the boy as well as to afford him trade experience in the shop. Penalties are provided for violation of contract which will involve a fine from $1 to $100 for either party; in addition, the regular penalties follow for the violation of the orders of the Industrial Commission, which are the same as violations of any other order of the Industrial Commission.

It is realized by the Industrial Commission that to obtain the best results for the trade with reference to the making of skilled mechanics it is necessary to consult the trade freely and to make the apprenticeship, so far as possible, a trade autonomy. The commission hence requested the State Association of Master Plumbers to nominate three men to serve on a board to be known as the Wisconsin Plumbers' Apprenticeship Board. It also appealed to the State Association of Journeymen Plumbers to nominate three persons from their ranks to serve on this board, under the auspices of the Industrial Commission. The State Board of Health was invited to place upon that board its representative of the plumbing trade, inasmuch as the supervision of plumbing installations and licensing of plumbers is under the jurisdiction of the State Board of Health. As a consequence the Wisconsin Plumbers' Apprenticeship Board was organized as follows:

Representing the State Association of Master Plumbers:

F. C. Kuetemeyer, Milwaukee, Wisconsin.

J. E. Robertson, Milwaukee, Wisconsin.

A. S. Dahl, Milwaukee, Wisconsin.

Representing the State Association of Journeymen Plumbers:

Leonard Mathews, Janesville, Wisconsin.

Fred Heise, Milwaukee, Wisconsin.

Ed Thal, Racine, Wisconsin.

Representing the State Board of Health:

Frank R. King, State Plumbing Inspector, Madison, Wisconsin.

Representing the Industrial Commission:

Stewart Scrimshaw, Supervisor of Apprenticeship, Madison, Wisconsin.

These men have been called together on several occasions and have worked out the solution which is herein contained. A great deal of consideration has been given to all phases involved, and it is realized that while no system could meet with universal satisfaction, the present proposals have received such unanimity of support as to offer high hopes of reaching a working solution of the apprenticeship problem in the plumbing trade in Wisconsin.

The apprenticeship matter was presented to the State Association of Master Plumbers by the state supervisor of apprenticeship at their annual convention under date of January 15, 1918. At that convention the association passed the following resolution:

"RESOLVED: that we, the Wisconsin Master Plumbers' Association, assembled in Milwaukee this 15th day of January, 1918, do pledge our cooperation in the enforcement of the apprenticeship law, Chapter 133, Laws of Wisconsin, 1915, and we will conform to any orders and rules governing apprenticeship in the plumbing trade which are the result of the deliberations of the Wisconsin Plumbers' Apprenticeship Board, and that we will furthermore take any other step necessary for the improvement of skill in the plumbing trade."

Under date of July 6th, the apprenticeship scheme was presented to the State Association of Journeyman Plumbers at their convention in Janesville, and as a result the following resolution was carried:

"RESOLVED: that we, The Wisconsin Association of Journeymen Plumbers, Steam, Gas and Sprinkler Fitters, assembled in annual convention at the city of Janesville, Wisconsin, July 6 and 7, 1918, do concur in the plumbers' apprentice indenture plan as formulated by the members of the Wisconsin Plumbers' Apprenticeship Board, and that we extend such assistance as will promote the best interests of all concerned."

It is needless to say that many difficulties will arise from time to time in the administration of this work, but by carrying out the broad general principles which are outlined and by the exercise of good-will on both sides, with full confidence in the good faith of the commission, all difficulties can be adjusted.

The apprenticeship system involves fundamentally three things: The contract, that is the formal agreement; the trade schedule, that is Exhibit A of the apprentice indenture; and the general rules for administration. The form of contract is determined by law. The schedule is determined by the Wisconsin Plumbers' Apprenticeship Board and is designed to meet the requirements of the law. The rules of administration are more flexible and are intended primarily to carry into effect the schedule, or Exhibit A.

The form of contract, shown on page 15 of the bulletin, is the result of many conferences and considerable deliberation by the general State Committee on Apprenticeship representing employers and employees. It was drawn up so as not only to conform to the law, but to make a just document for both employers and apprentices. It was necessary to have a contract that could be used for all trades and for all kinds of apprenticeships. On this form the mutual agreement with the names of the parties, etc., is contained on the first page, on the back of which is the text of the law. On the third page is stated the particular terms of the contract which refer to the individual trade, known as "Exhibit A." It is here where the chief consideration of each particular trade is involved and where the work of the trade apprenticeship committee is required.

For the plumbing trade the Wisconsin Plumbers' Apprenticeship has adopted the following trade schedule which will be Exhibit A of every apprentice indenture:

"The term of apprenticeship shall be five years, each year to consist of at least 275 working days, the first three months of which shall constitute a probationary period."

Exhibit A With Explanatory Notes

Extent of period of apprenticeship:

"The term of apprenticeship shall be five years, each year to consist of at least 275 working days, the first three months of which shall constitute a probationary period."

The length of this apprenticeship is based upon universal trade experience in the largest cities throughout the country, and in view of the fact that considerable time is required to make a good plumber, the effectiveness of whose work involves so much the health of the public, five years was agreed upon as the standard term. Two hundred and seventy-five (275) days are designated as the standard year so as to avoid any misunderstandings which may arise because of

Motor Truck Service

How Other Industries Make Use of Motor Trucks—How They Check Up Cost and Charge Same Up to Their Cost of Doing Business

By One Of Us

BEFORE going into a number of the details regarding motor truck service, it will be of interest to refer to the article which appeared in last issue of SANITARY ENGINEER and recall some of the remarks made by a number of our readers in connection with the service they received from cars and trucks used in their business.

One user stated that he did not know how he had ever got along without a car. Another declared that, while a motor truck cost forty per cent. more than a horse in upkeep, seventy-five per cent. more service was procured. Another user of a truck said that he and his brother, between them, were actually doing more work than four men did before they bought it. They hired 2 men at one time, and one of the brothers did the bossing of the other three; now both brothers were doing real work. A stenographer looked after the books, and their business was growing amain. None of the users of either trucks or cars would consider for one moment dispensing with them at any price.

It may be argued that many a man starting in business for himself and by himself, not expecting to employ any men for the time being, could not very well afford to buy a car or truck, and when we say "afford," we mean that he may not have capital enough to acquire one at the start. That is only one side of the argument.

When a man starts in for himself there is one thing he must keep in mind, and that is: that time is his only real asset, and to conduct a successful business he must plan to save time. When we say "save time," we mean that he must turn as much of his time into "charged accounts" or cash accounts, as possible, and to do that every moment is valuable.

The writer was once discussing the why and wherefore of things made with a number of young lads, and told them that nothing material, physical, mental or elemental existed that had not some specific purpose. One lad asked, Why adversities? Why wrong? Why street cars? Why trucks? Why autos? And the writer turned and asked some of the lads present to answer at least the more simple questions, for example: Why autos? The first boy to speak, replied that he thought that trucks and autos were mainly in existence to save time. Yes, of course, save time; and as we stated earlier in this article, time is the chief asset in this world; time is not material, it is gone, never to come back. Material has a price, but time is priceless, and therefore should be made most of by all. The poorer a man is, the less he can afford to waste it.

One young fellow, speaking, not long ago, as to how he acquired his truck, said that he, first of all, bought a motorcycle for $100, paid for it on easy terms; simply taking a few tools in a bag with him to a job. He earned enough the first six months to pay for the motorcycle outright, and added to it a side-car; made a presentable looking tool box, had his name painted thereon and used it for nearly a year, and in less than two years he had earned enough surplus cash to buy a two-passenger automobile. He took the back portion of the car apart and fitted it up so that he could put a short truck body to it, making this interchangeable, so that he could replace the rear part of the auto, thus enabling him to use his car in the evenings for pleasure, and the change can be made in 15 minutes.

This man declares that he can now do as much work in a day himself, and make as much profit as if he employed 3 men. Thus it will be plainly seen that the man who must make the most of his time must, in some way or other, secure some speedier method of locomotion than "Shank's mare," or street cars.

The writer has read many works regarding this motor truck problem, and in none of them has the author taken up the question as to the benefits which such an appliance would be to the "little fellow." But it must be at once admitted that if a big concern can save time and money by using trucks, surely the little fellow, whose only asset is time, would find that a truck or car would be a benefit, and is a necessity to him.

Here is another very unique, or rather a simple story, giving the experience of a "little fellow." Said he: "I bought a horse and wagon, and used it for two or three years. I only ran a one man business, and the horse feed cost me on an average in those days, $14.00 a month. I owned the shop and stable, paid $1,000 for the property. It cost me $15.00 a year for harness repairs, shoeing and other little expenses; cart grease and wagon repairs amounted to about $50.00 a year, so that I reckoned that it cost me about $230.00 a year for the horse and wagon."

Well, one of those travellers selling cars called on me one evening, just as I was putting up the horse for the night, about 6 p.m., and wanted me to talk motor trucks, but I was busy and said he'd better call later. I meant some other day, of course—but he called later alright, about 8 p.m. the same night, and, Mr. Editor, he told me things that made me sit up and take notice. He took my figures as to cost, and this is how he worked out my cost. See Table I:

TABLE II
COST OF HALF-TON TRUCK UP-KEEP

Two gallons gasoline, 15 miles per day, 15 miles per gallon, at 20c, 350 days per year	$140.00
Repairs, grease, tires, etc., 350 days, at 60c per day	210.00
Truck investment, $600.00, at 7 per cent.	42.00
Depreciation, 20 per cent. (This is too high)	120.00
Insurance, per year	10.00
Accident insurance, per year	10.00
Total up-keep	$532.00
Less 1½ hours' time saved at 75c, 300 days	$339.00
Making my actual cost of motor truck as against cost of horse	$193.00
Truck saving would be	$508.90

A better service, more work and better at less manual labor cost to a one-man business.

TABLE I
COST OF HORSE UP-KEEP

	Per day		Per year
Horse feed	$ .46	(365 days)	$167.90
Harness repairs, etc.	.05	300 working days	15.00
Repairs, wagon, etc., grease	.16 2-3	300 working days	50.00
Stable investment, $1,000	.19 1-7	7 per cent.	70.00
Attendance to horse, two hours	1.00	Every day	365.00
Investment on outfit, $200	.03 6-7	7 per cent.	14.00
Depreciation	.05½	10 per cent.	20.00
	$1.93		$701.90

No charges for insurance of horse, sickness and loss of time on that account, which may means loss of man's time, too, or even veterinary surgeon's, medicine, etc., accidents or other items.

He then took up the question of cost of a car, without considering the greater efficiency procured, such as ground covered, number of hours that could be charged to a customer, and money received. He said that the public were resenting having to pay for time not spent on a job, and so on. But he did boost up the idea which people would have of one who went to and fro from work in a motor car or truck, etc. Here is how he figured car cost, provided I covered a distance of 20 miles per day, with gasoline at 20 cents, (this was some years ago), 6 days a week, and I told him I only worked 5½ days per week, but he said he wanted to play safe and allow for everything that might come up.

He stated that in actual fact, and from figures taken, that his particular car or small ½-ton truck would cost a total of a dollar a day for upkeep, 300 working days a year, but that if for the sake of playing safe he allowed 350 working days, $350.00 would cover a 20 mile or 7,000 miles a year on $1.00 per day, including gasoline.

He then pointed out the saving of at least 1½ hours per day, that ½ an hour spent on a small truck would suffice as against 2 hours for horse attendance. He then pointed out that while I was only charging the horse attendance at 50 cents, I would likely charge the customer 75 cents, which I said I would. Therefore I would make $1.13 for the 1½ hours saved, and without going into minor details, splitting hairs as it were, his figures worked out as shown in Table II.

It must be remembered that these figures and arguments were used when our one-man business had been in existence two or three years. To-day these figures would be somewhat different. But as our friend from whom we got this information has had a truck now for two years, he was willing to admit that he would not keep a horse and wagon outfit if someone gave it to him. We received just such assurance from many owners of trucks and referred to same in our last issue. It must also be remembered that the man and firms whom we interviewed were conducting plumbing and heating establishments, so that the information procured and given to our readers should be of special value. The only way by which success may be attained in the sanitary and heating business, no matter what size the business, is to bear in mind that time is our most valuable asset, and any method adopted that will turn time into money cannot be other than commendable.

St. Thomas Gas Supply.—"It will relieve the minds of a great many startled gas users," says a St. Thomas paper, "to learn that, while last week's test of the city product was below Government requirements by some 12 points, the test taken Saturday morning by the Government inspector showed the quality of the gas to be appreciably higher and considerably over the Government minimum. The highest value obtained Saturday was 572 B.T.U. and the lowest, 562 B.T.U., with an average of 567 B.T.U., making the gas supplied at present 47 points above the minimum of 520.

CONFIDENCE

(New England Hardware News)

If you think you are beaten, you are;
If you think you dare not, you don't;
If you'd like to win, but you think you can't,
It's almost a cinch you won't.

If you think you're lost, you're lost;
For out of the world we find
Success begins with a fellow's will;
It's all in the state of mind.

If you think you're outclassed, you are,
You've got to think high to rise;
You've got to be sure of yourself before
You can ever win a prize.

Life's battles don't always go
To the strongest or fastest man;
But soon or late the man who wins
Is the man who thinks he can.

EXTERNAL PURIFICATION OF WATER

It is more scientific to purify the water before it enters the boiler than it is to follow the commoner plan of introducing it, with all its dissolved solids, and treating it after it is inside of the boiler. External purification is therefore strongly favored by modern engineers, whenever the conditions warrant it, and a number of effective forms of apparatus for purifying boiler feed water are on the market.

The photograph shows the members of the Toronto Warm Air Furnace Dealers Association assembled at their first annual banquet. They had as their guests for the evening the manufacturing of warm air furnaces. The members of the association are working towards having a practical heating bylaw put into effect.

VOL. XIII. MARCH 15, 1919 No. 6

MR. EDWIN NEWSOME, for the past six years associated with THE SANITARY ENGINEER, PLUMBER & STEAMFITTER OF CANADA, latterly as manager and editor, has severed his connection with the paper. Mr. Newsome has helped materially in placing the paper on its present high plane, and we will continue producing a paper which will maintain the confidence of the many subscribers in various parts of Canada, and in accordance with our policy we will endeavor to make each issue better than the preceding issue.

Mr. Newsome has our best wishes for success in his new field of endeavor.

GETTING RIGHT WITH THE WORKERS

IN Hamilton recently, a small and informal gathering of local industrial leaders and representatives of organized labor was held which promises to spread a significant influence throughout Canada in establishing more intelligent relations between capital and labor and offsetting the Bolsheviki tendencies which are so menacingly at work in this period of unrest and readjustment. The manufacturers and the labor leaders took dinner together and then in a practical way started in to discuss the industrial situation as between employee and employer. It was after midnight when the gathering broke up. The executives put their cards on the table frankly and the representatives of the workers were told in a straightforward way of what was being done and had been done in their interests. The results were most gratifying.

Largely as the outcome of this meeting, an organization is now being worked out by the Canadian Manufacturers' Association to bring about better relations between workers and their employers throughout Canada. A committee is being appointed from each of the eight branches of the Association to meet with representatives of the labor element for a free and frank discussion of industrial problems. These committees will work with a central committee for all Canada, thus completing a national organization. Further than this, manufacturers are individually urged to take up in a direct way their problems with their own employees.

If this idea of intimate relations between the manufacturers and their employees can be carried out in a broad way much will be accomplished to solve the greatest problem which industry has to face to-day. Tariffs and readjusting prices are in themselves questions which are difficult of solution, but they are tangible in character as compared with that unknown quantity which may be termed "social unrest."

NEW EDITORIAL FEATURES

COMMENCING with the next issue, the SANITARY ENGINEER will contain several new editorial features. Arrangements are now under way, and practically completed, for an editorial service that will include many features not previously included in the editorial department of this paper. A more complete announcement, giving details, will appear in the April 1 issue.

WILL WAGES REMAIN UP?

THERE appear to be a great many contradictory views regarding the future of wages and prices. Some weeks ago the feeling was quite general in most quarters that within the next few months there would be reductions in wages to such an extent it would be possible to reduce the prices on many manufactured products in which labor cost is one of the biggest factors.

During the past couple of weeks there is less disposition to encourage the view that there will be a reduction in wages in the immediate future. The *American Metal Market* in referring to this condition states that the remarkably small amount of unemployment occurring with the apparent dullness in nearly all industries is being recognized as an evidence that labor is not likely to be as plentiful as was expected. The demobilization proceeds slower, from the standpoint of the men who are being taken into industry. This is not surprising in view of the experience after the civil war. The men were near home then, yet they were absorbed with practically no disturbance. Increased attention is being paid to the movement and prospective move-

ment of the foreign born. It is well known that a great many of the foreign born intend to return to the land of their birth, and even if many who now intend to do so do not carry out the intention there will be a great migration nevertheless. It would be strange, indeed, if this did not occur. If it is not a great boon to the people for whom independent republics are being set up in Europe, why is it being done? If it is a great benefit to those peoples, why would not the new condition draw some men from this country?

In the circumstances it is easy to see that possibly there will be no trend at all for wage rates for common labor to decrease.

DISHONESTY IN BUSINESS

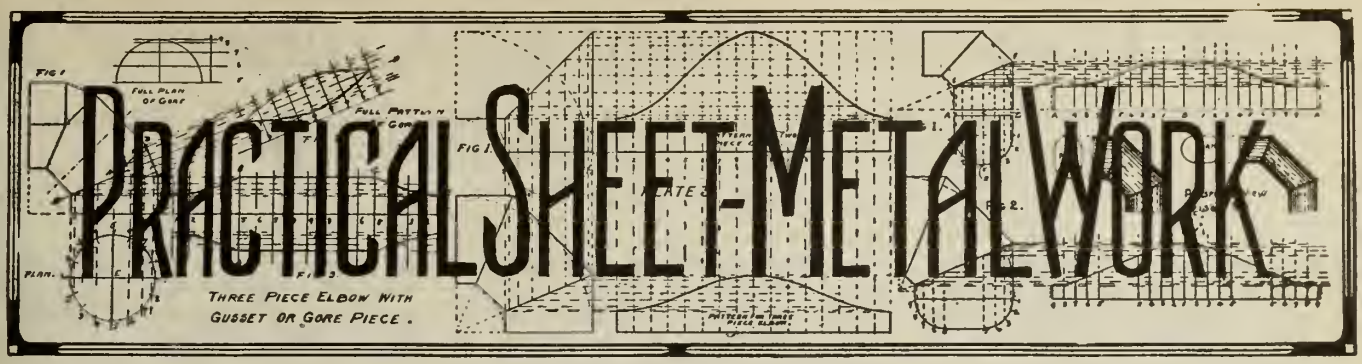
THE whole fabric of modern business and industry is based on confidence. Any one, be he retailer, wholesaler, or manufacturer, who breaks faith with another, takes a slash at business in general. There are those who break their contracts when prices decline, and feel safe in the knowledge that it would cost too much to litigate, and the judgment would not cover all the loss of money, and none of the loss of time. Sometimes, a real business man does get disgusted, and in spite of his loss, he gives the offender a lesson on the ethics of business for the benefit of the country in general. There are, however, large numbers of the small calibre business man who manage to stay in business, sit tight while markets rise, and welsh when prices decline—usually escaping the penalty, probably because the game is not worth the ammunition.

It has been known for a carload of canned fish from the Pacific Coast, packed and labelled to the order of an Atlantic house, to be cancelled by wire a few days before date of shipment because the market has declined, and the shipper, with a carload of canned fish on his hands, was told, "He could use his own judgment about shipping, but the stock would be refused on inspection." What powers of clairvoyance! It has been known that a carload of Eastern jams, has been accepted en route only on greatly modified terms by the consignee in the West, which simply meant that goods were received under terms and at prices which, had the shipper known, the goods would never have been shipped. It has been known that cars of fresh fruit from the fertile valley of the Fraser have been refused on arrival on the Prairie—except they were delivered to the "Buyer" on consignment only, and the wily shipper, instead of "falling," took the night train, and reached the Prairie point to find the cars well iced and unopened.

There is a serious lack of the fundamental basic principles of honesty evident among some engaged in business, and it is the duty of every business man to stamp out the unprincipled, unethical member wherever his presence is discovered. Make it unprofitable to be morally as well as legally dishonest.

Current Events in Photograph

The photo shows one of the British "K" class submarines, the largest underseas boats in the world. This one, which is 350 feet long, ran ashore in a fog on the coast of Lancashire. It was refloated and proceeded on its way undamaged next day. This type of boat, it will be noticed, carries a four-inch gun fore and aft as well as an anti-aircraft gun amidships.



BY THOMAS STANSFIELD

IN the last issue we dealt with the inside round piece in connection with an extension chimney top, the accompanying plate shows the top part of the chimney cap, and how to develop the pattern for it.

A full elevation of the whole extension is shown in Fig. 1, along with plan of cap. First draw the tap as shown at AA, BB, CC, DD, and EE, this to be same size as the octagon piece shown in plate 40 which appeared in last issue. Next draw the plan, with line intersecting any two sections and the centre E. Now draw a vertical line as in Fig. 2, A, D, E, B, and with compasses measure off the various distances between line E in plan and points AB, AB, DE, DE to the vertical line in Fig. 2. To procure the true length of material required for the pattern, transfer the measurements from one side of the elevation B to E, E to D and D to A, to the vertical line in Fig. 2, by joining the various points of intersection. The pattern for one side of the octagon piece is now complete. This is all that will be needed, as all the eight sides are the same. Allow as shown a small piece of sheet metal for joints which is generally riveted.

Fig 3 shows the plan and elevation of an octagon stand or newel post. While there are not very many of such articles made these days, the developing of the patterns will prove very interesting practice. First draw the outline shape as shown at A, B, C, D, E, F, next the plan, dividing same with eight equal parts from the centre. The outer corners will show the student how to arrive at the proper way to design the proportions on the post equally, by drawing lines from the moulded parts to the mitre lines on the plan. The base CD, is merely an octagon box with hole in top of same, which will, when complete, be covered over by the post. Fig. 5 shows shape of braces that may be fitted inside the base piece to stiffen it.

Now draw a stretchout line in line with centre of plan and measure the side of post from points H, F. J, K, as follows H, 1, 2, 3, 4, 5 and so on to 10, then the true length between F and J in one measurement. Next from J to K into smaller parts, transfer these measurements to the stretchout line.

From these points on side of elevation draw a number of vertical dotted lines down to the mitre line L, and again from points developed on mitre line L draw a number of lines parallel with the stretchout line.

After drawing vertical lines across these parallel lines at the various points 1, 2, 3, 4, etc., till 15 is reached, only one more operation is required, viz., that of

Heat Loss and How to Conserve It

Definition of the Term "Heat"—How Heat is Lost—How Heat Can Be Conserved —Where Heat Can Be Saved—Various Heat Insulators Described

By One Of Us

THE dictionary tries to define heat in a few words, while on the other hand, hundreds of scientific books have been published, the authors of which have made a special study of the subject.

But, for all practical purposes, it can be stated and taken for granted that heat is, in some form, the product of combustion of fuel, friction, or is created by the sun's rays.

It would be too long a story to begin, or even try to begin to explain the above definitions. But, as before stated, those simple solutions as to what heat is, are sufficient as an explanation to the average reader.

There is, however, one form of heat which most of our readers are particularly interested in and familiar with; that is the first named, viz.: That form of heat which is generated by combustion of some form of fuel. Heat is vital to every industry and to every living being, and our fuel statisticians are warning us that our fuel is becoming scarcer every day, though at the rate we are wasting it we do not appear to fear any lack or shortage of fuel.

We have used coal in a most extravagant manner, and now, with oil becoming popular, we are wasting that too. We do not waste the latter to as great an extent per B.T.U. as we do the former, because, with oil, certain mechanical appliances that can be adjusted and regulated, are more under control than is the consuming of coal, this requiring a more perfect combustion of all the gases that are released by subjecting coal to heat.

But in both cases heat units are being wantonly wasted, on the one hand by the careless way in which boilers and steam generating plants are installed, and on the other hand by the lack of insulation of piping and vessels carrying either hot water or steam. By way of illustrating, here follows a very simple experience which the writer had some years ago.

A certain householder complained of a kitchen range giving poor service; she could not bake with the oven. A range boiler stood near the kitchen door and it was connected to the waterfront in the range. The writer put two ply of air-cell asbestos and canvas cover round the boiler, and the range oven at once worked well. That is a very simple and small matter to mention. On another occasion it was a case of covering the range boiler in the same way, which resulted in a direct saving of $1.00 per month on the gas bill. Gas was at that time $1.00 per thousand cubic feet net.

The Measurement of Heat

When we refer to the heat loss in a building, we really mean that when we heat a building to, say, 70 degrees, the temperature outside being at zero, a certain heat loss will result. It is just a matter of enclosing a certain cubic content of air at an outside temperature, and, by radiation, raising the air to 70 degrees. And to do so we must, say, heat a radiator by steam or water, taking from the contents of the radiator those B. T. units generated at the boiler or furnace.

We know that if the outer surface of a receptacle is hot, heat is escaping; that is, technically speaking, defined as heat loss. But, of course, to accurately measure such heat loss would mean the utilizing of special and expensive appliances. Though in a few words it may be stated that when steam is conveyed to a radiator at, say, 2 lbs. pressure, and water of condensation is measured by either weight of cubic measurement, and the temperature of the condensed water is taken, the difference in B. T. U. in the water and the B. T. U.s of steam delivered would show what heat loss had resulted.

The standard of heat measurement is the British Thermal Unit, which corresponds roughly with the second of time, the ounce by weight, or the inch in length, viz.: It is a unit of measurement. Steam is water gas, or water turned to vapor. One cubic inch of water will make one cubic foot of atmospheric steam, so it will be noted that water expands to 1,728 times its volume when turned to atmospheric steam.

One B.T.U. is defined as that amount of heat required to raise one pound of water one degree Fahrenheit. There are about 13,000 useful B.T.U.'s in one pound of coal, and one pound of coal will approximately convert 7 to 10 lbs. of water into atmospheric steam, depending, of course, upon the character and efficiency of the boiler, the way it is fired and the combustion of the coal.

Radiation, Conduction and Convection

The average heating engineer is apt to define radiation as so much metal or "radiators." As a matter of fact, such is not the case. Radiation is rather "the action of passing of heat from a solid body to the atmosphere." Conduction, or contact, carries the heat of a pipe (radiator) boiler from an interior to an exterior. Convection, or circulation, creates that motion which spreads the heat through the surrounding atmosphere, and all three terms really mean one and the same thing—heat, loss or leakage—and all these three forms of heat loss are going on unless some means is followed by which the heat in any piping, boiler, etc., is conserved by covering up in some way or other.

Poor and Good Conductors

In China and Japan it is stated that some buildings are heated by having the heat pass through ducts similar to chimneys, under the floors, and that the warmed floors are depended upon to heat the building. It would not be practical to use metal floors, because the heat loss would be so great that the floors could not be walked upon, so stone or mud-covered floors are used. The more solid a material is (homogeneous, metallic, etc.) the more rapidly it loses heat, and therefore metal is the most rapid conductor of heat. Even some metals are better conductors than others, the denser the better, viz., aluminum, lead, copper, tin, brass sheet; next in turn, cast brass; and next, cast iron. Rolled iron or steel would be a greater conductor than cast, simply because of the fact that cast iron is more porous. But the reason why the cast iron radiator is the most popular is because there are other points to consider, such as manufacturing, durability, construction, longevity, etc., etc.

Conservation of Heat

Now, as to the conservation of heat, there are a score and one ways by which heat can be saved, and should be, not taking into account the score and one ways by which steam or heat is first generated. This article really is mostly concerning the saving of heat after it has been generated. Most heat wastes take place in portions of a building which do not require heat, steam mains, risers, etc., and even though, say, a basement requires heating, it would be far better and much more economical in the end to cover all mains and furnish radiation for the heating. Many steam heating systems have been made less efficient because of the fact that the steam mains were used as radiation, and the steam was wet as a result of condensation forming in those mains, while drier steam would have resulted in a greater heating efficiency in the whole system.

There are quite a number of pipe coverings on the market, all of which have their merits and demerits, but when maximum efficiency from a heating system is required the best pipe coverings are none too good for the purpose.

However, the true secret of pipe coverings is the number of air-tight confined cells of which the pipe covering is

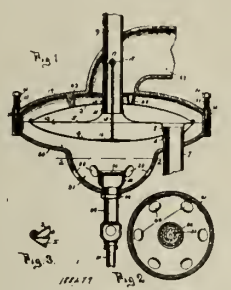
New Canadian Patents

No. 188,479

John B. Dudley, Detroit, Michigan, U.S.A., 28th January, 1919; 6 years. Filed 21st October, 1918. Receipt No. 300,629.

Claim.—1. In a water heater, the combination of a water chamber consisting of upper and lower outwardly convex heads and a substantially flat horizontal



188,479. Water Heater.

diaphragm between them, a pipe connecting into the space above the diaphragm to supply water thereto, said diaphragm having a hole through which said water may pass to the space below it, a burner below the lower head, and a housing extending around the burner and then around te water chamber with its walls substantially parallel to the outer portion of the lower head and to the upper head to cause the burnt gases to flow in engagement with said surfaces of the water chamber.

7. In a water heater, a water chamber consisting of two circular heads convex away from each other, and a substantially flat diaphragm between them provided with an opening to permit the flow of water, a feed pipe passing through the lower head at one side of its center and connecting into the diaphragm, a discharge pipe passing through the center of the upper head and connecting into the diaphragm, and a burner below the center of the lower head and said discharge pipe.

11. In a water heater, a water chamber consisting of upper and lower heads, a diaphragm between them provided with a single opening to permit the flow of water, a single feed pipe connecting to said water chamber so as to supply water to the space above the diaphragm, said feed pipe and said opening in the diaphragm being spaced apart and near the edges of said diaphragm, a discharge pipe connecting into said water chamber below the diaphragm, and means to heat the lower head of the water chamber.

Claims allowed, 11.

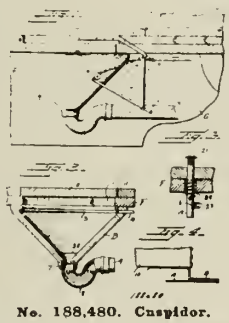
No. 188,480

William Dunnell, Detroit, Michigan, U.S.A., 28th January, 1919; 6 years. Filed 4th November, 1918. Receipt No. 301,088.

Claim.—1. A cuspidor, comprising a bowl, a waste pipe in communication with the lower portion of the bowl, a flush pipe arranged within the upper portion of the bowl and leading from a suitable source of water supply, a valve interposed in said flush pipe, a movable lid normally closing the upper face of the bowl, a member operatively connected with the lid for swinging the lid into open position, and a connection between said last-named member and the valve whereby the valve is moved into open position when said member is operated to move the lid into open position.

3. In combination, a bowl, a waste pipe in communication with the bowl, a hingedly supported lid normally closing the bowl, a rearwardly directed arm carried by the lid, an endwise movable rod, a lever supported for swinging movement, an end portion of the rod being pivotally engaged with said lever, and a flexible connection between said lever and the arm whereby the lid is moved in one direction upon movement of the rod in one direction.

4. In combination, a bowl, a waste pipe in communication with the bowl, a hingedly supported lid normally closing the bowl, a rearwardly directed arm car-



No. 188,480. Cuspidor.

ried by the lid, an endwise movable rod, a lever supported for swinging movement, an end portion of the rod being pivotally engaged with said lever, a flexible connection between said lever and the arm whereby the lid is moved in one direction upon movement of the rod in one direction, and a guide pulley adjacent the lever and over which the flexible member passes.

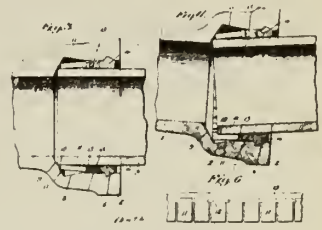
Claims allowed, 6.

No. 188,494.

James R. McVane, Birmingham, Alabama, U.S.A., 28th January, 1919; 6 years. Filed 25th October, 1918. Receipt No. 300,781.

Claim.—1. A prepared self-tightening joint suitable for pipe, comprising bell and spigot portions with a series of filler blocks constituting a backing for the sealing material, the bell having a basic portion against which the blocks abut, fibrous packing material lodged against the backing, and sealing lead at the mouth end of the joint in compacting relation to the fibrous packing material.

4. A joint for bell and spigot pipe comprising filling means located at the basic end of the bell and constituting an anvil, fibrous packing material engaging the anvil, and lead packing between the fibrous packing means and the mouth of the bell in compacting relation to the fibrous packing means.



No. 188,494. Pipe Joint.

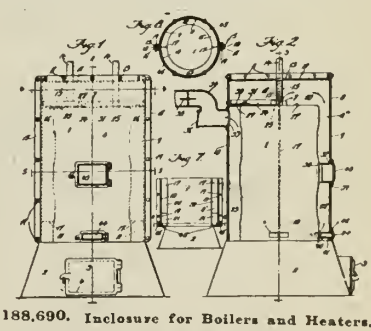
6. A joint for bell and spigot pipe, comprising filling means constituting an anvil, fibrous packing engaging the anvil, and lead packing in compacted relation to the fibrous packing.

Claims allowed, 6.

No. 188,690.

Harry C. Streeper, Bristol, Pennsylvania, U.S.A., 11th February, 1919; 6 years. Filed 28th June, 1918. Receipt No. 296,714.

Claim.—1. The combination of a heater having an outlet opening for the products of combustion, a jacket surrounding said heater and spaced therefrom to provide a chamber, said jacket being made in plurality of sections and having outwardly projecting flanges, baffle plates having outer edge portions secured between said flanges and having their inner portions extending across said chamber and into engagement with said heater, said latter portions of the baffle plate being interrupted in their length at opposite ends to divide the chamber into a number of compartments and to provide a passageway forming communication between the compartments at a position remote from said



188,690. Inclosure for Boilers and Heaters.

outlet opening of the heater, another baffle connecting said baffle plates and forming a closure for certain of said compartments between said outlet opening of the heater and said remote passageway, said jacket having an outlet opening adjacent said second baffle, substantially as described.

(Continued on page 30)

WISCONSIN APPRENTICESHIP

(Continued from page 14)

the boy becoming sick or taking vacations, etc.

Schedule of processes to be worked:

"During the first three years of his apprenticeship the apprentice shall receive instructions and experience in all branches of plumbing necessary to develop a thorough, practical, and skilled mechanic versed in theory and practice of installing hot and cold water supply, drainage and venting and plumbing appurtenances, in accordance with the State Plumbing Code and local ordinances. The apprentice shall perform such other duties as are customary in connection with plumbing apprenticeship." Where vocational schools are established he shall attend school five hours per week, or its equivalent, to receive such instruction as may be determined in accordance with Section 2377 of the Statutes.

"During the fourth and fifth years the apprentice shall be given in addition to experience and instruction as provided for the first three years, opportunity to make plumbing installations under the supervision of a journeyman or master plumber such as may enable him to qualify at the end of his apprenticeship as a skilled mechanic in the art of plumbing."

This schedule of processes has been the result of much thought and study. Obviously, a man cannot be a plumber who knows only shop mechanics. But a modern plumber must, in addition to being a skilled mechanic, know certain theory with reference to hygiene, materials, elements of citizenship, etc. This the vocational school provision is meant to cover. It is, furthermore, well-known that to be a skilled-mechanic the apprentice must have an opportunity to use the tools of the trade; so, for that reason, there is an express statement that during the fourth and fifth years the boy shall be given such opportunity as will enable him to acquire some independence of workmanship at the expiration of his term.

Compensation to be paid—the apprentice shall receive in wages:

"Minimum rate of wages:

First six months	$.....	per week
Second six months	$.....	"
Third six months	$.....	"
Fourth six months	$.....	"
Fifth six month	$.....	"
Sixth six months	$.....	"
Seventh six months	$.....	"
Eighth six months	$.....	"
Ninth six months	$.....	"
Tenth six months	$.....	"

Suggestion: Upon receipt of his state license the apprentice shall be given a kit of plumber's tools by the employer."

Rates of wages are to be adjusted by the parties to the contract. It is suggested that in all cases the wages be uniform in the particular community if possible.

Special provisions:

"Both parties to this indenture agree to cooperate with each other, the apprenticeship school and the Industrial Commission of Wisconsin in carrying into effect the intent and purposes of this indenture. At the satisfactory completion of the apprenticeship the apprentice shall receive a diploma issued under the seal of the Industrial Commission and the Board of Health of the State of Wisconsin."

The Industrial Commission is granted by mutual agreement of the parties to this contract, the right to change any rules of this indenture if such changes are deemed by the Commission to be in the public interest.

RULES OF ADMINISTRATION

"1. Forms of contract which shall contain the content Exhibit 'A' shall be furnished by the Industrial Commission.

"2. Contracts should be received in the office of the Industrial Commission at Madison, during the first thirty days of the employment of the apprentice, it being understood that the contract is not binding until after the expiration of three months from date beginning apprenticeship.

"3. Apprentices shall be informed by the school authorities on advice from the Industrial Commission as to when and where they shall attend school for academic instruction as agreed under Exhibit 'A' of the contract.

"4. Apprentices while attending school are still employed and paid by the employer, and they must show the same application to work as if in the shop.

"5. Employers shall report immediately any apprentice whom they shall know to have unlawfully left his employer.

"6. Employers shall not discharge a boy without good cause and not then until such matter has been considered by the commission or a deputy thereof, and both sides of the case recorded, but may suspend an apprentice for sufficient cause pending a hearing. Cases in controversy to be adjudicated by the Industrial Commission through advice of the Wisconsin Plumbers' Apprenticeship Board.

"7. At the end of three years the apprentice may make application for an examination for a license according to law and rules and regulations presented by the State Board of Health, but this shall in no sense affect the terms of the apprenticeship indenture.

"8. Under the law apprentices already employed are required to execute the apprenticeship indenture but shall be duly accredited for all time they have been employed as such.

"9. Under the law apprenticeship indentures already accepted by the Industrial Commission shall not be affected by the adoption of Exhibit 'A' of the plumbers' apprenticeship contract.

"10. Present arrangements which have not been legally executed shall be changed so as to comply with the law and the apprenticeship rules."

Those administrative rules have been determined to assist in an equitable administration of the system, and, being rules, can necessarily be changed or modified according to the exigencies of experience, provided, of course, substantial consent is obtained from the trade.

Technical Education Outside of Shop

It is not the purpose of the apprenticeship plan herein outlined to prevent an apprentice from terminating his contract in favor of a technical education outside the shop. When a young man under indenture desires to pursue a technical course in a trade or technical school, he may make arrangements with the Industrial Commission. In such case his contract with the employer may be legally terminated. Or he may desire to enter a school of higher education, in which event he may apply to the Industrial Commission for advice, and suitable arrangements will be made.

Requirements for Journeymanship

The following outline suggests the subjects with which the apprentice in the plumbing trade should become familiar before he can perform efficiently the work of a journeyman plumber and expect to receive a diploma and license from the state. These requirements do not represent the highest possible attainments for the plumber, but strike a fair level to which a plumber must rise in order to be called a skilled mechanic.

I. Materials and Tools of the Trade, and Principal Essentials to be Learned

The apprentice should familiarize himself with the principal materials of the trade and other essentials involved in plumbing work, especially the following:

(a) Tools—plumber's kit and shop tools.
(b) Cast iron pipe and fittings.
(c) Wrought iron and commercial steel pipe and fittings.
(d) Vitrified clay pipe and fittings.
(e) Lead pipe, sheet lead, and solder.
(f) Copper, brass and kindred metals.
(g) Galvanized iron materials.
(h) Tile, marble, slate, cements, and composition materials.
(i) Plumbing fixtures—kind, design, materials and construction of.
(j) Faucets, valves, tanks various makes.
(k) Traps—kind, design, depth of seal, materials and construction of.
(l) Pumps, syphons, catch-basins, and ejectors.
(m) Domestic hot water heating appliances.
(n) Miscellaneous materials.
(o) State Plumbing Code, trade publications, books on theory and practice of plumbing recommended by the Plumbing Division, and standard plumbing supply catalogues.

II. Trade Terms

A mechanic or apprentice should acquaint himself with the meaning of the following terms used in the trade. Many of these are explained in the Wisconsin Plumbing Code, issued by the Wisconsin State Board of Health:

Neatness	Stack
Approved	Grade
Flux	Horizontal and vertical pipes
Location	Hanger
Air	Support
Light	Background
Ventilation	Centre
House sewer and main drain	Clean-out
House drain	Terminal
Soil pipe	Catch-basin
Waste pipe	Capacity
Main soil or waste vent	Diameters
Vent pipe	Sketch
Back vent pipe	"Dont's for plumbers
Unit vent	Care
Circuit vent	Method
Trap	Connections
Depth of trap seal	Change or direction
Deep seal, reseal'ing trap	"Prohibited"—"permitted"
Deep seal	Overflows
Subsoil drain	Radius of bend

III. Tools of the Trade

The apprentice must acquaint himself with the following list of tools of the trade and must learn their use:

A. Plumber's Kit.

Conductors, or roof leaders	Sewer air ("gas")
Back flow	Circulation
Dead end	Fresh air
Private sewer	Substantial
Sanitary sewer	Construction
Septic or biological tank	Design
Cesspool	Domestic hot water
Roughing in	Safe water supply
Wiping a joint	Effluent
Sanitary plumbing	Disposal unit, dry well
Private dwelling	Inspection
Alignment	Defective
Terminal	Testing
Public building	Syphonage
Place of employment	Good workmanship
Private residence	Service
	Law, ordinance, rule, order, code

B. Shop Tools.

Hammer	Rasp
Wood chisel	Dresser
Cold chisel	Bending pin
Compass saw	Copper soldering bolt
Auger	Wiping clotbs
Rule	Springs, 1¼" to 2"
Square	Tap borer
Plumb bob	Shave hook
Level (spirit)	Hack saw
Drills and reamers	Plumber's furnace, pot and ladle
Plier	
Compass	Pot hook
Screw driver	Caulking tools
Monkey wrench	Snip shears
File	Brick and stone drill
Turn pin	Joint runners
Drift plug	

C. The apprentice should learn the use and arrangement of a tool chest, how to sharpen the tools, and the necessity for maintaining them in good condition.

IV. Design of Installation

The apprentice must obtain knowledge sufficient to design plumbing installations, and in that connection must learn:

Cutters	Reamer
Stock	Pipe bending tools
Die	Pipe wrench
Vise	Chain tong

(a) Proper use of materials.
(b) Sizes, grades, changes in direction and alignment of piping.
(c) Arrangement of drain, soil, waste, vent, water piping, and appliances in connection therewith.
(d) Neatness of design, efficiency of service, and durability of construction.
(e) Location of fixtures with reference to light, air, convenience, and proper sanitation.

Continued on page 31

Market Conditions and Tendencies

Statements Regarding Supplies and Trend of Prices

THE MARKETS AT A GLANCE

DECLINES have been provided for in new quotations issued this week on range boilers. The present scale of prices shows a general reduction approximating 12½ per cent., the contributing factor very largely being lower priced steel sheets now available.

Black steel sheets have come in for a further readjustment this week, and jobbers indicate that they are down to rock bottom in relation to their costs to-day. There is a feeling prevalent in the trade that lower prices should prevail on sheets, and the first of April, ending as it does the first quarter of the year, is looked forward to as the date when mills may institute a further decline in prices. Should a lower price schedule obtain it would seem as though many jobs now being held back will be undertaken and business resumed along more stable lines. Galvanized sheets have also declined since last issue, 25c per 100 pounds being lopped off the price in some quarters.

Copper, tin and lead have been halted in their downward move; in fact all ingot metals seem to have pretty well reached the bottom for the present. There is quite active buying of copper at prices prevailing to-day, and lead has firmed up, with spelter stronger in sympathy. The next two or three months are active ones for the various metals, and it does not seem as though any further appreciable change downward is a prospect before summer.

What may develop at meeting of iron and steel interests in United States now is still somewhat uncertain, but that a lower basis will be arrived at is the opinion generally held. Should this develop, the effect on soil pipe and fittings, wrought pipe, boiler tubes and kindred lines is not hard to determine. Another week or two should clear up the situation materially.

TORONTO, March 13.—Further readjustments have been made in black steel sheets this week and a decline of 25c in galvanized sheets has also been made. Range boilers have sagged about 12½c per cent. and a somewhat weaker tone is reported in soil pipe and fittings, though no price change is recorded as yet. Ingot metals seem to be somewhat near the bottom, with copper, tin and lead showing some slight reaction.

Decline in Range Boilers of About 12½%

RANGE BOILERS.—The weaker tendency of the market, as outlined in SANITARY ENGINEER the last two issues, has developed in lower prices being named on range boilers this week. These follow on the heels of substantial reductions made in sheets and indications are that the basis arrived at will prove much more satisfactory from a consuming standpoint. New prices on the standard boilers are given as follows: 12 gal. and under, $9.50; 20 gal. and under. $10.50; under 30 gal., $11.50; 30 gal., $12.25; 35 gal., $15.00; 40 gal., $18.00; 52 gal., $24.00; 66 gal., $33.00; 82 gal., $40.00; 101 gal., $50.00; 120 gal., $65.00; extra heavy boilers quoted for the 30 gal., $14.50; 35 gal., $17.00; 40 gal., $20.00; 52 gal., $28.00; 66 gal., $38.00; 82 gal. $47.00; 100 gal., $58.00; 120 gal., $75.00; 144 gal., $90.00; 168 gal., $100.00; 192 gal., $110.00.

Range Boilers	Standard	Extra Heavy
30-gallon	$12 25	$14 50
35-gallon	15 00	17 00
40-gallon	18 00	20 00
52-gallon	24 00	28 00
66-gallon	33 00	38 00
82-gallon	40 00	47 00
100-gallon	50 00	58 00

Heating Coils Under Revision Too

HEATING COILS. — Quotations on heating coils have been revised; also prices being issued this week. The charge on these is extra to that named on the range boilers. The following quotations are now effective: 30 gal. and under, $12.00; 35 gal., $14.00; 40 gal., $16.00; 52 gal., $20.00; 66 gal., $25.00; 82 gal., $28.00; 100 gal., $31.00; 120 gal., $35.00; 144 gal., $40.00; 168 gal., $45.00; 192 gal., $50.00.

Enamelware Shows Steady Outlook

ENAMELWARE—There is little buying interest manifest in enamelware at the present time, and new developments in the markets are lacking. The trade, however, are satisfied with the outlook and feel that prospects encourage optimism.

Bath-tubs, roll rim, 4, 4½, 5 feet, 24 to 30 in. wide	$32 10
Bath-tubs, 5½ ft.	35 70

Closets, oak tank and seat	27 00
Do., enamel iron or white vitro tank	29 00

Soil Pipe, Fittings Hold Unchanged

SOIL PIPE, FITTINGS.—No quotable change in the market situation on soil pipe or fittings is yet apparent, though the feeling seems to be generally held that lower price levels are about due and may develop before the end of the present month. Business is rather quiet, though there are some fair sized orders being handled.

Situation in Valves Remains Steady

VALVES.—The situation in regard to valves is without appreciable change. Quotations still hold at unchanged figures, and whereas a fairly good business is being handled, this could be increased and is reasonably expected to improve when things open up a little more with the coming of Spring.

Wrought Pipe Holding Steadily

WROUGHT PIPE.—There have been no new developments in the market on wrought pipe. What may develop as a result of the present conference of steel men in the United States seems just a little uncertain, but best informed men in the trade look for reductions in steel and iron prices by April 1, and that pipe may fall in line seems quite probable. Prices for the week hold at figures shown in panel herewith:

WROUGHT PIPE
Price List No. 38—January 6, 1919.

Cotton Waste Prices Down; Oakum Firm

WASTE, OAKUM.—New quotations on some lines of colored waste were omitted in listing changes in last issue. These are reproduced herewith, the present figures being lower than those formerly in effect. Quotations are: Fancy, 15½c per lb.; Lion, 14c; Standard, 12½c; Popular, 11c; Keen, 9½c. Cotton waste is now pretty well down to lower price levels, quotations being revised a couple of weeks ago on some lines. New prices on some of the other numbers, which are also lower, are shown herewith: White, XXX. 19c per pound; XX, 18c; X, 16½c; XC, 15c; Japanese, 14c; colored, No. 5, 15c per pound; No. 1, 13½c; No. 7, 12c; No. 1A, 10¾c; No. 1B, 9½c.

There has been no change in the situation on oakum though prices on marine oakum rule with a very firm undertone. Business is fair and outlook generally considered satisfactory.

	Per 100 lbs.
Best American	$21 00-$22 00

Plumbers', spun	10 00- 10 50

Boiler Tubes Remain Unchanged

BOILER TUBES.—Boiler tubes are holding at lower figures established this week. Jobbers report sales as very good, and that they are now able to secure deliveries quite promptly from the mills. Whether boiler tubes will be affected by any changes made as a result of present meeting of steel interests is unknown, but they may well follow course of other materials. Range of quotations follows:

BOILER TUBES—	Per 100 feet Seamless	Lapweld
1 inch	$28 00	$.....
1¼ inch	32 00	.....
1½ inch	35 00	28 00
1¾ inch	35 00	28 00
2 inch	40 00	28 00
2¼ inch	43 00	30 00
2½ inch	45 00	35 00
3 inch	52 00	40 00
3¼ inch	.....	47 00
3½ inch	62 00	48 00
4 inch	70 00	60 00

Black Sheets Lower; Galvanized Down 25c

SHEETS, PLATES.—Revised prices are again shown this week in black sheets, and jobbers state they are positively down to rock bottom, when working on to-day's cost. A decline of 25c per 100 pounds has also been made in some quarters on galvanized sheets, bringing the base on 10¾ oz. to $8.25. There seems to be a desire on the part of the mills to get as close as possible to the point where buyers will confidently come into the market, knowing that they are safe in making extensive purchases.

There is a feeling in the market and in the trade generally that a cut is likely to come in steel prices. When? Perhaps on either side of April first. That, at least, is the opinion of one Toronto dealer whose guesses are seldom far off the mark. There seems to be a growing belief that prices of material are holding back considerable work that might otherwise be gone on with. Just how much more business would be booked at a lower steel price is, of course, problematical, but several of the dealers are quite certain that the coming of a lower figure would bring a lot of buying to the market.

There seems to be some danger that the reduction may not be made in such a manner as to preclude the danger of a price-cutting campaign. Were this to start it might be difficult to put a peg in and stop the movement, and prices might easily be flattened to below costs The general belief is that a new schedule will become operative about the first of April, and the trade generally will be glad to witness a return to a basis where they can get out after business without the possibility of having their feet cut out from under them. Quotations being named to the trade follow:

BLACK SHEETS—	Per 100 lbs.	
10 gauge	$5 50	$6 00
12 gauge	5 55	6 05
14 gauge	5 60	6 10
16 gauge	5 70	6 20
18-20 gauge	....	6 30
22-24 gauge	....	6 35
26 gauge	....	6 40
28 gauge	....	6 50
3-16 inch plate	....	5 75
¼-inch boiler plate	....	5 50

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

GALVANIZED SHEETS—		
10¾ oz.	$8 25	$8 50
U.S. 28	7 95	8 20
U.S. 26	7 65	7 90
22 and 24	7 50	7 75
18 and 20	7 35	7 60
16	7 20	7 45

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

Lead Products, Solder Show Firmer Feeling

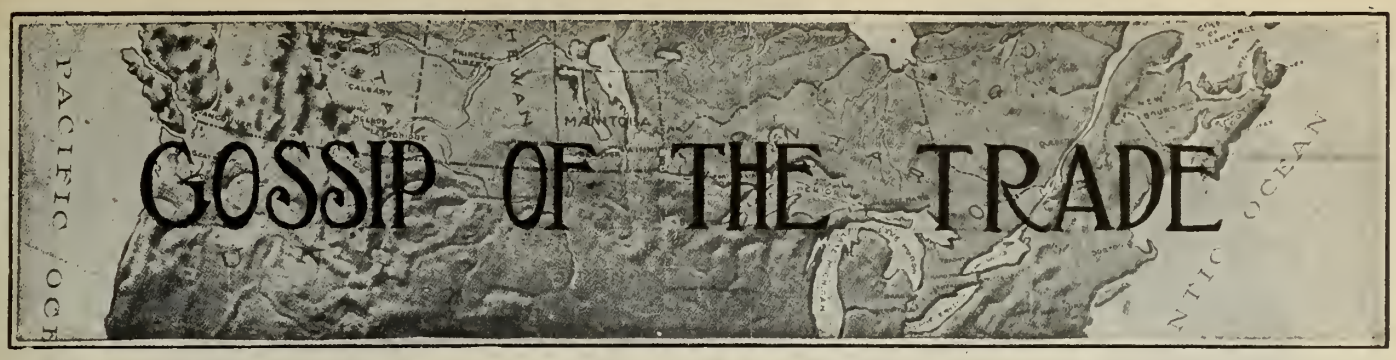
LEAD AND ZINC PRODUCTS.—A firmer undertone to the market on manufactured lead products is noted this week. This has not resulted in a quotable change upward, but it seems to have stopped the downward movement. Both tin and lead have strengthened somewhat, and it looks as though solder and lead products may hold quite steadily for some little time. Prices being quoted to-day follow:

Lead pipe lb.	....	$0 12
Lead waste pipe, lb.	....	0 13
Lead traps and bends	....	Net list
Lead wool, lb.	....	0 14
Lead sheets, 4 to 6 lbs., sq. ft., in rolls, lb.	0 11	0 12½
Cut sheets ½ to ¾c lb. extra and cut sheets to size, 1c lb. extra.		
Solder, guaranteed, lb.	$0 35	0 37
Solder, strictly, lb.	0 33	0 37
Solder, commercial, lb.	0 30	0 36
Solder, wiping, lb.	0 29½	0 42½
Solder, wire, lb.	0 40	0 45½
Zinc sheets, per lb.	....	0 20

Old Materials Go Still Lower

OLD MATERIALS.—The list has again come in for further revision downward and dealers are not anxious to buy even at prices named to-day. Reviewing the present situation, one of the largest dealers in Toronto had the following to say: "It is hard to believe that prices can go down to a lower level than they are at present. A great deal rests, as far as red and yellow metals are concerned, on what the United States and Dominion Governments intend to do with the scrap metal they have in their hands at present. There are millions of tons of this material, and the manner in which it is going to be disposed of will make a great deal of difference as to the future of the scrap metal markets. If the policy adopted is simply to throw this material on the market, why, it means that the situation will be glutted, and prices may stop hardly short of nothing at all. If, on the other hand, they decide to control the release of this scrap, and allow it to come out in quantities that can be readily absorbed in the trade, then matters may be much better and a gradual recovery would be looked for by the trade. Much the same condition prevails in the other lines of machine shop scrap, and the Government

(Continued on page 30)



OTTAWA NOTES

New Plumbing By-law to be Discussed

The Ottawa plumbing by-law will again be up for consideration shortly. This by-law received its first reading in the council some time ago, at which time the local architects raised an objection because they felt that they should have been consulted in the matter. They then undertook to draft a by-law themselves, which they considered would be suitable.

Business Dull

Master plumbers here say business is very dull, and the outlook not particularly bright, unless house-building begins. There is a great scarcity of small houses, and it is hoped that the Government's scheme for the encouragement of building of this class will reflect favorably on the plumbing business.

Start Up in Business

About the only recent change in a business way to be noted here is that C. Rennick, a journeyman, has begun business for himself.

Number of Ottawa Plumbers Killed

About ten of the local plumbers who went to the war have returned. Seven or eight were killed, and there are some overseas. Several of the returned men are idle.

With reference to the by-law above referred to, SANITARY ENGINEER has already taken it up and discussed the good points in it.

The trouble does not lay in the proposed by-law, but rather in the fact that the architects of Ottawa were not consulted regarding the compiling of same.

There could be no harm in discussing such matters with a board of architects if there were any logical reason for so doing.

Very few architects actually know anything about engineering of any kind, least of all plumbing and heating, therefore why should they be consulted?

There is just about as much reason in plumbers and sanitary and heating engineers asking to be consulted about architecture. No plumber would ask to be taken into the confidence of architects regarding matters architectural.

The biggest troubles we have to-day with poorly laid-out plumbing and heating systems, result from the interference of architects. Sanitary engineers want to co-operate—they must do so—with architects, but there is a great deal of difference between co-operation and domination. Sanitary engineers, as well as heating experts, are willing to co-operate. It is the architects who seek to dominate, and in the case of Ottawa's new plumbing by-laws, there are no practical reasons why the architects should have taken the stand they did. It is they, and they alone, who are responsible for the delay in having this by-law passed.

SANITARY ENGINEER desires to see more co-operation between all branches of the building trade, from the architect down.

PRESIDENT LOUTRELLE
Of the Montreal and District Master Plumbers' Association who sees a bright outlook for 1919.

NEW BUILDING INSPECTOR APPOINTED

W. C. Beattie, newly appointed Superintendent of Buildings, Board of Education, Ottawa, well known in heating business in and around Ottawa, becoming associated early in 1915 with the C. A. Dunham Company, Limited, as heating engineer and manager of their Ottawa office.

Previous to this Mr. Beattie had followed the architectural profession and was also in the employ of the Johns-Manville Company. His experience will have equipped him to very efficiently look after the welfare of pupils in Ottawa school buildings.

MONTREAL NEWS

The many friends of James R. Meadowcraft, manager of the Garth Company, Craig street, Montreal, will regret to learn that his health has not been of the best for some time.

Mayor James Ballantyne, Montreal West, and Mrs. Ballantyne, have left for Atlantic City in company with Mr. Ballantyne's brother, Hon. C. C. Ballantyne, Minister of Marine and Fisheries. They expect to be away several weeks.

The Master Plumbers of Montreal held their annual bonspiel at the Caledonia rink on Tuesday last. While the ice was not in good condition, there was a considerable amount of interest, and the report of the scoring and prizes will follow.

Indications are developing most favorably as the date of the annual convention of the Canadian Society of Domestic Sanitary and Heating Engineers' approaches, that there will be a big time on June 4th and 5th. All that seems necessary upon the part of the trade throughout the country is enthusiasm and co-operation. It is high time that every member, who can do so, arrange his plans so that he can be in Montreal on these two days. The time and money spent will prove a real investment, for there are many big things to be discussed, and the personal contact will be most beneficial. Let all plan to make this the biggest and best convention ever.

HALIFAX PLUMBING INSPECTOR RESIGNS

J. Morrissey, city plumbing inspector of Halifax, has sent in his resignation, to take effect on May 1st, when, it is understood, Mr. Morrissey will go into partnership with Franch Purcell in the plumbing and steamfitting business.

Mr. Morrissey has always been a hard and faithful worker and did especially fine service in the time following the explosion, working night and day. Halifax loses a faithful civic servant with his retirement.

INFORMATION WANTED RE FLUSHOMETERS

Editor SANITARY ENGINEER:—Will you kindly answer the following questions with regard to direct flush valves for W. C.?

First, does the quantity of water used at each flushing vary in different makes of valves?

Second, provided the valves are properly adjusted, would a difference in pressure, such as would be obtained between a basement floor and the upper floors of a building, affect the quantity of water used, or merely the speed at which the flushing takes place?

Third, how much water should such a valve pass at each flushing with a pressure of 30 lbs. per square inch?

AN ALBERTA SUBSCRIBER.

In the first place, before answering our inquirer, it would not be out of place to state that a direct flush valve or flushometer is an apparatus which is supposed to and does take the ploce of a W. C. tank. And it should also be stated that some W. C. bowls require more water to thoroughly flush them out than others; also that W. C. tanks, like flushometers, can be made to discharge any quantity of water desired, except that, in the case of the tank, the volume of water is limited to the capacity of the tank from the lowest level to the overflow pipe. But, suppose this happened to be 5 gallons, the tank could be set to discharge as low as 1 gallon; this, of course, would be accomplished by setting the automatic ball cock to close off when the tank contained 1 gallon of water, or possibly a little more. But in the case of flushometers, they can be adjusted to discharge almost any quantity, because they are directly connected to the water supply.

Regarding the first question asked by "Alberta Subscriber":

No, the quantity does not vary because the variation is not in the valve itself, but in the adjustment, so that almost all valves could be set to discharge any given volume desired.

Second question: Such valves are not, as a rule, set before they are installed, unless the pressure has been first determined; for example, turn to Fig. I, which shows 4 W. C.'s connected to a city water supply direct. The flushometer in the basement would have to be adjusted, or rather closed down more, because it is nearest the water supply, and is not subject to any very great elevation. The flushometer on the first floor would be opened up more because there is a certain amount of the pressure required to simply elevate the water to a higher level, and the same arguments would apply to those flushometers on the floors above.

It will be noted in Fig. 1, however, that the pipe at the stop cock is smaller, above the first tee it is larger, and is increased in size as it rises from floor to floor. This is because flushometers require both pressure and volume, and when a flushometer system is installed, it is always desirable to make sure of volume.

In replying to the third query, we may state that it is not a case of volume under any given pressure, because some flushometers would discharge more than others, according to their construction.

It is rather a matter of how much water the W. C. bowl needs to thoroughly cleanse and discharge all the solids from the bowl. For example, take the amount of water flushed from an ordinary W. C. tank. It takes 10 seconds to discharge four gallons of water from a W. C. tank, the high water level above the top of the bowl inlet being 19 inches, the bend being 2 inches in diameter. Now, allowing the 1-inch static head for friction, the pressure amounts to approximately ¾ lb., or equal to about ½ lb. per foot head.

We will now ask our readers to turn to Fig. II. This shows how, say, the same type of flushometers would have to be installed. They are supplied with water from a cistern above and such an installation would not be affected by variation of pressures because the installation shown in Fig. 1 is affected by any variation in city pressures and at certain times this may be great. In most cities the domestic water supply is used for fire purposes and when a fire occurs in a certain district, the pressure is boosted up. This would affect the discharge of flushometers installed as per Fig. 1, and the writer has been informed of many cases where flushometers have been damaged by such occurrences. On the other hand, if flushometers were regulated, say with the pressure at the city main standing at 60 lbs. per square inch, and because of a defective city

Forgetting

One of the things we all do well is to forget.

Names that were household words yesterday are gone to-day.

Because people knew your Name and your Line a year ago it is no sign they do to-day. They forget easily.

Keep yourself in the public mind by advertising. It is just as important to make old friends remember as it is to win new friends. Advertising does both.

main the pressure was considerably reduced; then the reduction, too, would affect the volume discharged.

Now, such a condition could not be established where flushometers are installed as shown in Fig. II. The cistern is supplied with an independent supply pipe, controlled by an automatic ball cock, and as the ball cock may be set to open and close with a variation of one foot, the small amount of head loss, would not affect the flushometers would not affect the flushometers on the floors below. Not only so, but in case water was turned off the building for a short time, there would be a supply of water in reserve, the quantity

Continued on next page

TORONTO NEEDS MORE PUBLIC COMFORT STATIONS

Speaking editorially, the Toronto "News," in its issue of March 5th, condemns the lack of public comfort stations in Toronto.

At the present time there are only eight in the city, situated as follows: Broadview and Queen, Parliament and Queen, Toronto and Adelaide, Shaftesbury Avenue and Yonge St., Spadina and Queen, at the Sunnyside station on King St., Lansdowne Avenue and Dundas St., and Keele and Dundas.

The majority of these are underground, and the one at Shaftesbury and Yonge is only housed in a temporary building.

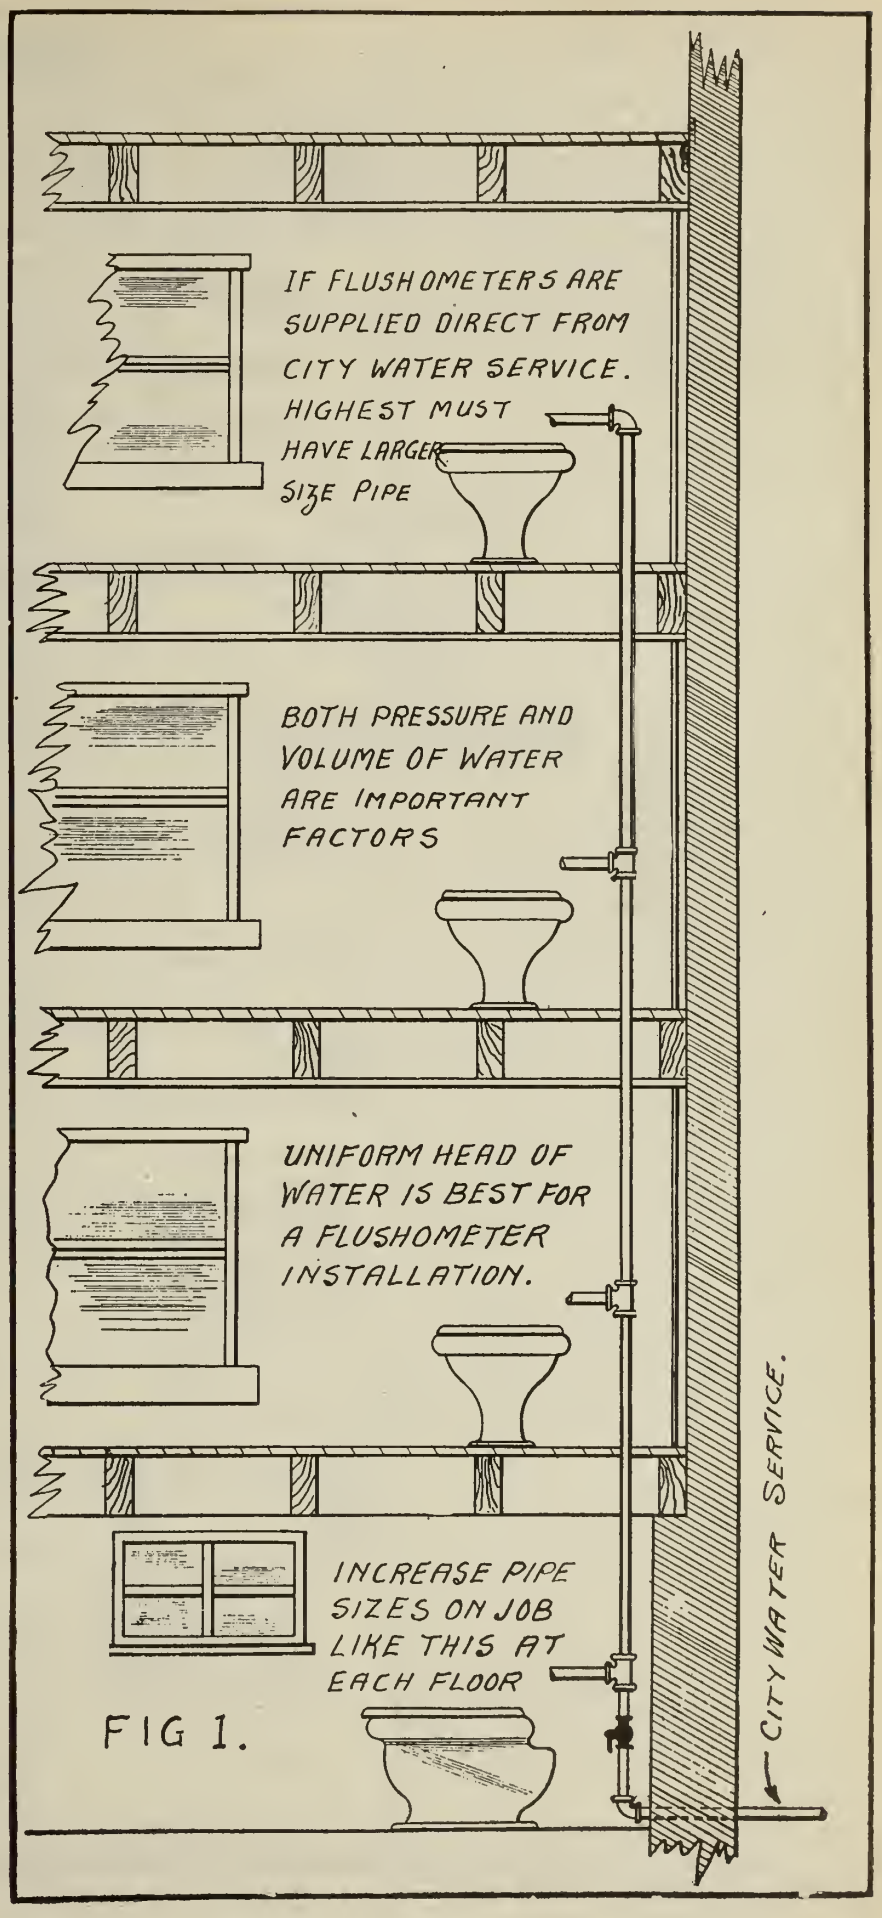
Property Commissioner Chisholm is urging that three additional stations be installed. The Board of Control is only prepared to vote $17,000, to provide one additional station, at the present time. The eight in existence cost $36,200 in upkeep.

We agree with our contemporary in asking that in spite of the expenditure the additional accommodation, which the growth of the city has made necessary, be provided. In the words of the "News," "No one looking at a map of Toronto will admit that the city is completely or adequately served in this respect."

WHEN DOES STEEL BECOME SCRAP?

When is steel scrap? This is the question which was raised in the United States courts when the G.T.R. protested a duty of 10 per cent. ad valorem on wornout steel bridge, which had done duty for 15 years, which they were shipping as scrap into the States.

The American customs department levied the duty mentioned, claiming the bridge was dutiable under the Act of 1913 on structural shapes of iron or steel, but the railway protested and at length the Board of General Appraisers rendered a decision that the old bridge was scrap, and, therefore, duty free.



IF FLUSHOMETERS ARE SUPPLIED DIRECT FROM CITY WATER SERVICE. HIGHEST MUST HAVE LARGER SIZE PIPE
BOTH PRESSURE AND VOLUME OF WATER ARE IMPORTANT FACTORS
UNIFORM HEAD OF WATER IS BEST FOR A FLUSHOMETER INSTALLATION.
INCREASE PIPE SIZES ON JOB LIKE THIS AT EACH FLOOR
CITY WATER SERVICE.

FIG 1.

THE QUESTION BOX

Continued from page 27

being, of course, determined by the size of tank.

It will be noted that the pipe from the cistern to the first floor below is the larger size, and sizes are less as the various floors below are reached. This is because of the static head, the pound pressure per foot being greater the lower the pipe drops. Therefore a larger quantity of water will pass through the smaller pipe at the lower floor. Many manufacturers of flushometers prefer the installation as shown in Fig. II to that shown in Fig. I.

TO INVESTIGATE DISPUTES

The Senior British Trade Commissioner in Canada and Newfoundland (Mr. G. T. Milne, 367 Beaver Hall Square, Montreal) has been notified by the Imperial Department of Overseas Trade in London that he is empowered to appoint an expert to examine and report upon consignments of goods from the United Kingdom, in respect of which a dispute has arisen, and to certify the signature of such experts as authentic. The Commissioner will, however, only intervene when requested to do so by both parties to the dispute.

The kind of disputes in which the commissioner may intervene are those regarding goods which are alleged to be not up to sample, or which have arrived in a damaged condition, owing to faulty packing. The Commissioner is not authorized to deal with claims under insurance policies for goods damaged during the voyage.

As the official Trade Representative in Canada and Newfoundland of the Indian Government, the Commissioner is also authorized to act in regard to disputes relative to shipments from India.

The remuneration of experts appointed by the Commissioner is a matter for the parties to the dispute. No fee will be charged for his services.

The British Trade Commissioner at Toronto (Mr. F. W. Field, 257 Confederation Life Bldg., Toronto) is empowered to act in disputes out of shipments to Toronto and to other centres in Ontario.

MORE MONEY FOR CHIEF ENGINEER AT TECK

The Advisory Industrial Committee of the Board of Education decided to raise the salary of the Director of Engineering of the Technical School, which is now vacant, owing to the death of Mr. M. L. Smith, who was accidentally electrocuted some weeks ago. Only four applications for the position were received by Dr. McKay, and it was upon his pointing out to the committee that a good man could not be obtained for a salary of $2,400 a year, that after some discussion it was raised to $3,500.

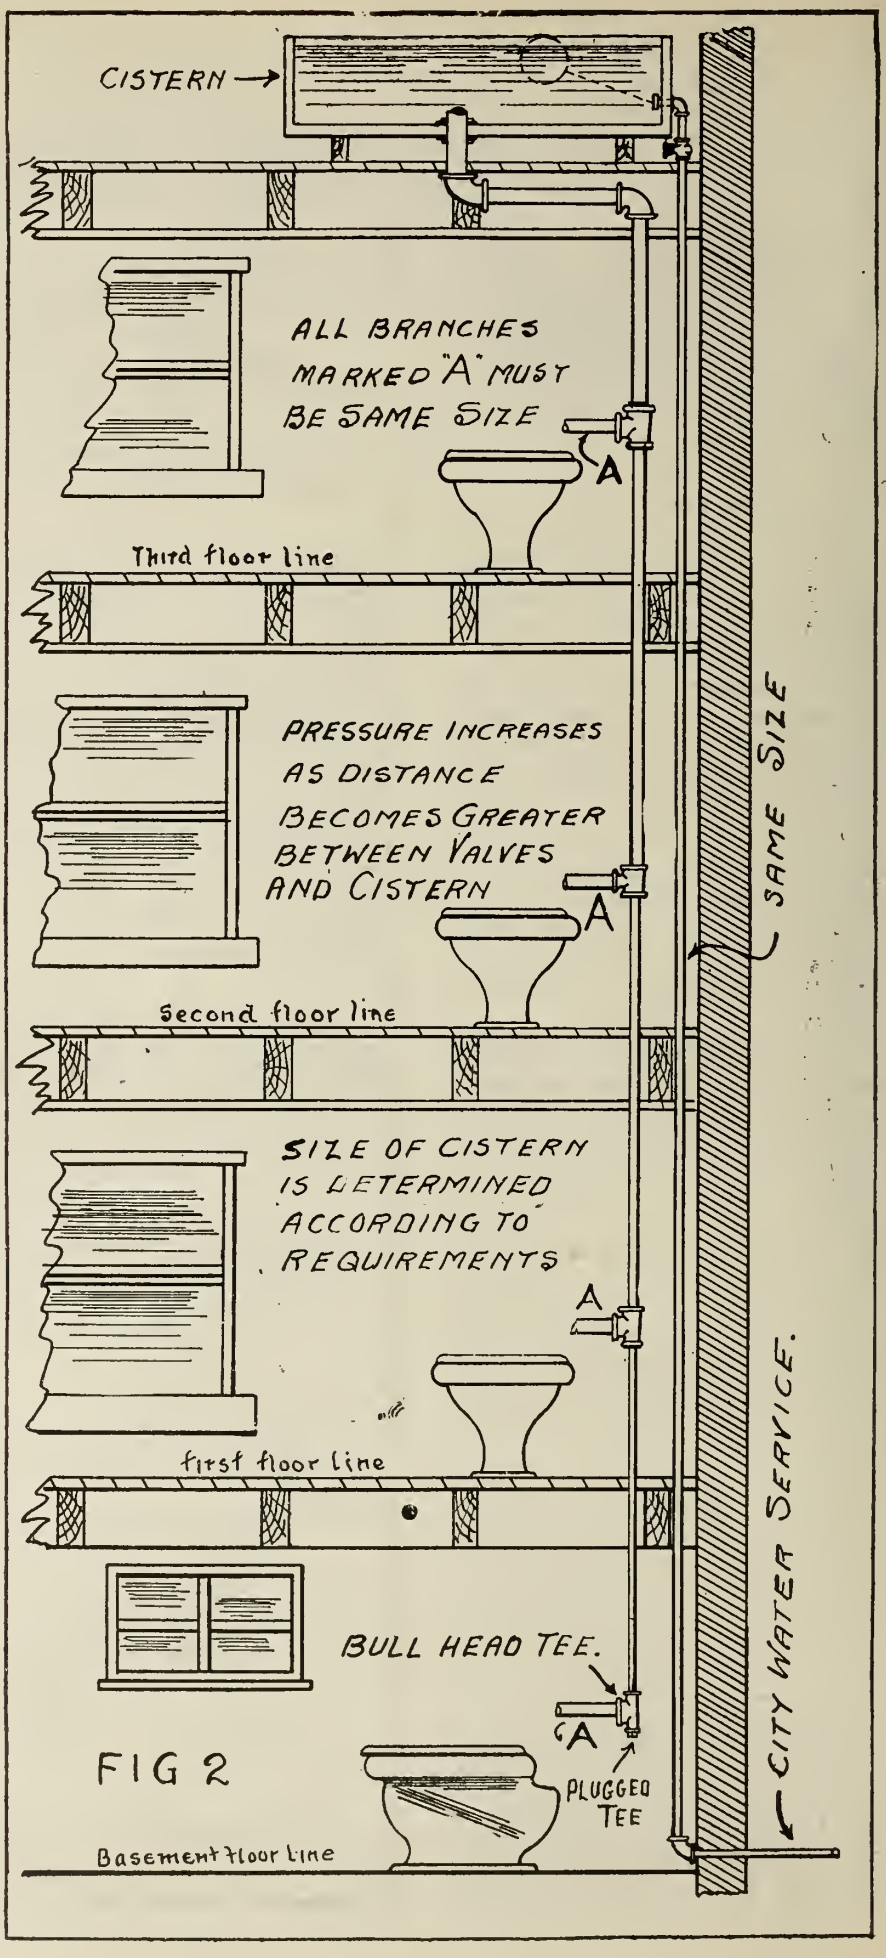


FIG 2

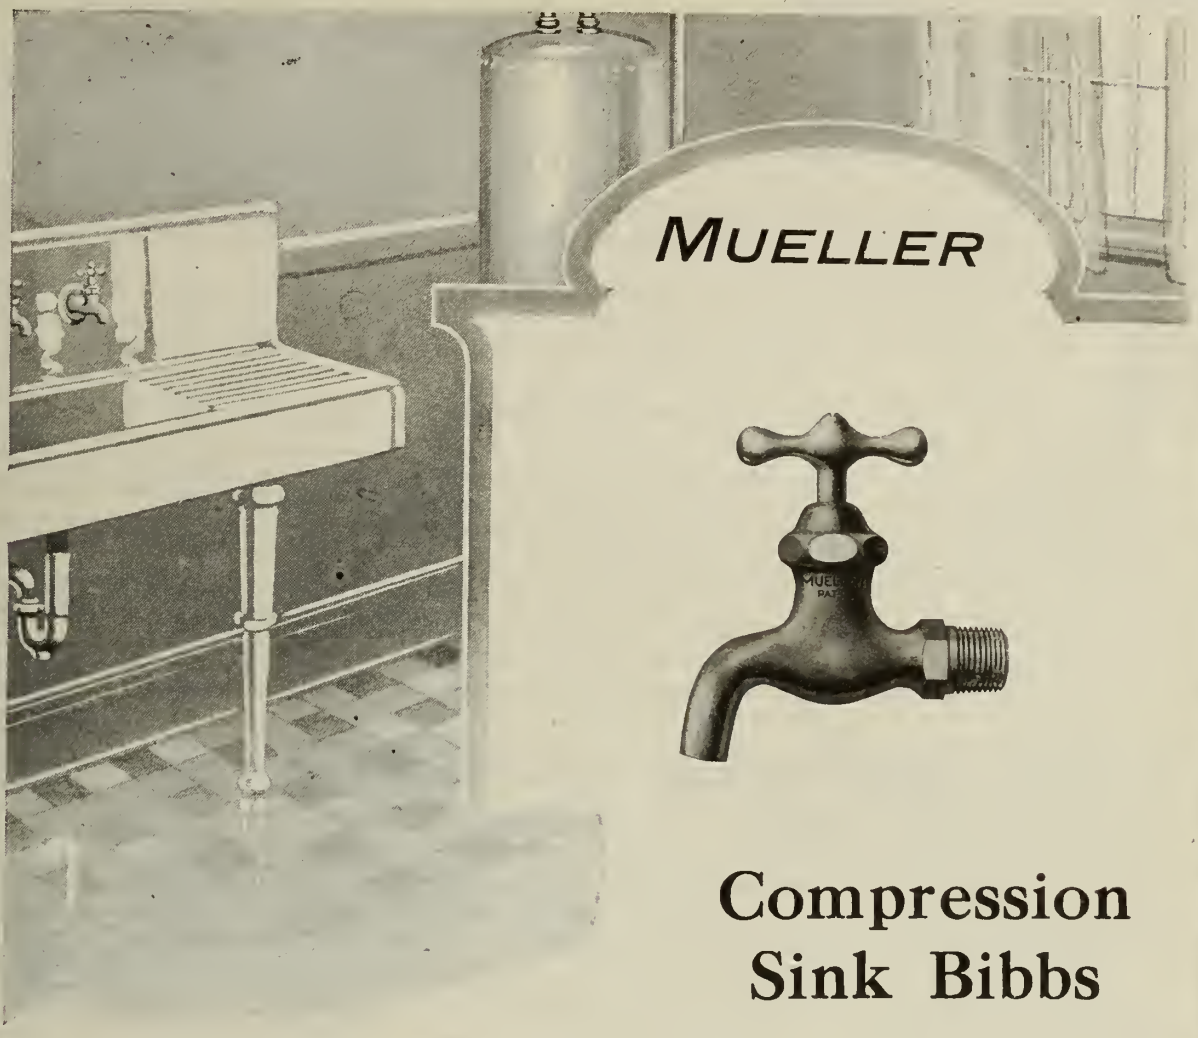

Compression Sink Bibbs

SIMPLE elegance, combined with superior strength and wearing quality, is what you give your customer when you install **MUELLER** goods.

The many advantageous features of **MUELLER** compression bibbs give maximum service from the bibb as a whole. The anti-spreading device that breaks up the whirling motion of the water and the corrugated stem and handle, allowing the handle to be set at any angle without becoming loose or wobbly, are only two of these features.

MUELLER Bibbs are the best the market affords. Write for prices.

PRACTICAL SHEET METAL WORK

(Continued from page 19)

drawing a solid line through the points of intersection.

This will give a one-half pattern up to point K.

Fig. 4 shows how the top piece A, B, K, is developed, which is really a repetition of the course followed when drawing the half pattern, except that the full pattern of this piece is shown, by simply placing the compass on the stretchout line C, D, at the different points 1, 2, 3, 4, 5, 6, 7, and 8, and, dividing the vertical lines into equal portions below the stretchout line.

(Continued in next issue.)

HEAT LOSS AND HOW TO CONSERVE IT

(Continued from page 20)

comprised. Air cell asbestos, if not made air-tight at the joints, can have its efficiency greatly lowered. Magnesia covering is very good, but requires careful handling. It is easily broken, though it does not depend upon tight joints, and when such covering is broken it can be mixed up again with water and molded onto fittings.

Early pipe coverings were made up in a very crude way of wood lagging, chopped hay, feathers, or hair, and these materials were then covered with mud. The writer can well recall having to cover steam boilers with sawdust and clay, just sufficient of the latter to make the sawdust, cut hay, hayseeds, and the like, adhere to the apparatus to be insulated.

But to-day, no such crude methods need to be adopted. There are a large number of pipe and boiler coverings, all made to sizes, etc., and in various forms. The greatest trouble of all is that so little is used in comparison to the amount that should be used, which would result in almost solving the transportation problem of this Continent.

MARKET CONDITIONS AND TENDENCIES

(Continued from page 24)

can do much one way or the other to stabilize the market for this material. Until these points are decided, it is hard to see how there can be anything approaching a betterment in the conditions of trade."

Dealers brought down the prices on all grades of coppers again this week, crucible, heavy and wire now being placed where dealers offer only 12¾c per pound for them. Brass cuttings and turnings, both red and yellow, are also down considerably. Perhaps the most noteworthy drop is in heavy melting steel, which sank to-day to the low quotation for Toronto yards of $9 per ton, while boiler plate comes down to $8. There is certainly nothing in any of these quotations to tempt holders disposing of their material, and dealers claim they do not want to take on anything for fear of still lower levels.

Dealers' Buying Prices—		
Tea lead		0 03
Heavy lead pipe		0 04
Pipe scrap		8 00
Stove plate per ton		10 00
No. 2 busheling		8 00
Yellow brass		0 06
Red brass		0 08½
Light brass		0 05
Scrap zinc		0 05
Heavy copper		0 15
No. 1 machinery cast		14 00
Wrought iron, No. 1, per gr. ton	18 00	15 00
Heavy melting steel		9 00

Copper, Lead, Tin Declines Halted

INGOT METALS.—The downward move in copper, tin and lead seems to have stopped, and dealers seem to feel that, considering present-day costs, all ingot metals must be pretty well down to a pre-war basis. It would appear that there can be no industries using large quantities who will really be in a much more favorable position to buy than at present. Three big consuming months are at hand, which may be expected to steady, if not stiffen, the markets, and whereas the summer may see some slight reaction from present levels, the declines cannot be as great as those already affected by any means.

COPPER.—Copper seems to have reached an attractive basis of selling now, and there is more business being placed. Prices locally range around 20c per pound, and outlook seems much better than it has for some time.

TIN.—There is a very fair demand and the market has firmed up with lowest quotations for the week being made at around 60c per pound. Supplies seem to be very fair and outlook is considered much better.

SPELTER.—The market is quiet and there is little of great interest to the trade. Buying is within rather a narrow compass and supplies ample. Quotations locally are being made at 8½c per pound.

LEAD.—The market is firmer and prices have advanced again slightly. Locally quotations are being made around 7½c per pound. There is some business being handled and outlook seems satisfactory.

ALUMINUM. — Open market conditions now prevail on this metal, but this has made little apparent difference as yet, buying interest being lacking. Quotations nominally range around 50c per pound, with lower prices probably available for actual business.

ANTIMONY.—The market is purely a routine affair. Price holds around 8½c per pound with little activity to move stocks.

NEW CANADIAN PATENTS

(Continued from page 21)

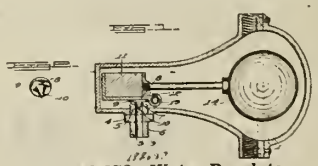
2. The combination of a heater having an outlet opening for the products of combustion, a jacket surrounding said heater and spaced therefrom to provide a chamber, said jacket being made in a plurality of sections, said sections being detachably secured together, baffle plates having outer edge portions secured between said sections and having wing portions extending into engagement with said heater, a segmental baffle spaced below the top of the jacket extending from said wings and separating said outlet opening of the heater from one of said compartments, said jacket having an opening below the segmental baffle leading from said latter compartments, said baffle plates providing a passage between said compartments whereby the products of combustion are compelled to pass around and in contact with the outer surface of said heater prior to passing out of the opening in the jacket, substantially as described.

3. The combination of a heater having an outlet opening for the products of combustion, a jacket surrounding said heater and spaced therefrom to provide a chamber, said jacket being made in a plurality of sections, said sections being detachably secured together, baffle plates secured between said sections and having wing portions extending into engagement with said heater, a segmental baffle extending from said wings and separating said outlet opening of the heater from one of said compartments, said jacket having an opening below the segmental baffle and leading from said latter compartment, said baffle plates providing a passage between said compartments whereby the products of combustion are compelled to pass around and in contact with the outer surface of said heater prior to passing out of the opening in the jacket, said segmental baffle having an opening therein above the space between the outer side of the heater and the inner side of the jacket, and a damper for normally covering said opening, substantially as described.

Claims allowed, 3.

Ernest G. Ofeldt, Nyack, New York, U.S.A., 11th February, 1919; 6 years. Filed 2nd July, 1918. Receipt No. 296,790.

Claim.—In a meter regulator, the combination with a casing, a nipple entering the same and having a valve seat at its inner end and a float lever pivot-



No. 188,672. Water Regulator

ally mounted in said casing and having a weight at one end of a freely movable valve comprising a disc resting freely against the under face of said weight, and a conical portion to enter the nipple and to engage the seat at the inner end thereof.

Claims allowed, 1.

—A REMEDY—

For Inefficient Heating Systems

THE KNICKERBOCKER AUTOMATIC HEAT GENERATOR

How about those Badly Working Hot Water Heating Systems your customers were telling you about? Were you able to give expert advice for remedying the faults?

The **Knickerbocker Automatic Heat Generator** meets a necessary want in such a situation.

It increases Radiation 25% to 50%. Makes the old system work like new, with a substantial saving in fuel. As necessary to the new installation as to the old.

A high-class specialty you should be selling. Splendid profits in it. Write for information and prices.

Manufacturers and dealers in a complete line of plumbing and heating supplies.

The James Morrison Brass Mfg. Co., Ltd.

93-97 Adelaide St. W., Toronto, Ont.

WISCONSIN APPRENTICESHIP SYSTEM

(Continued from page 22)

V. Drawning

The young mechanic must learn to use a pencil so as to make illustrative sketches to describe work that he is doing, as well as to assist him in planning a design. He should acquire the ability to read accurately blueprints, specifications, and all other working drawings. No man can be a proficient mechanic until he is able to read working drawings pertaining to work in his trade.

VI. Arithmetic

Knowledge of the fundamentals of arithmetic should be acquired, embracing:

Addition
Subtraction
Ordinary multiplication
Division
Fractions

The apprentice should learn the tables of:

Commercial weight
Liquid measure
Square measure
Cubic measure
Trades tables, rules and calculations.

A journeyman should be able to estimate proper amount of grade for drainage, to calculate water pressure, etc., and to compute drainage area, capacities, and the like.

VII. Physics

The apprentice should learn elementary physics such as pertain to his trade. He should know the effects of heat and cold on lead, tin, brass, and iron, and such other factors as are detrimental to plumbing materials. He should be acquainted with the principles of physics involved in the water hammer, pump, syphon, and trap.

VIII. Chemistry

A plumber should know the chemistry involved in the use of lead, tin, brass, red lead, white lead, lithrage, cements, fluxes, sewer gas, septic tanks, water contamination, and electrolysis.

IV. Practical Tests of Workmanship

A Journeyman should be able to:

(a) Accomplish satisfactorily the average sized plumbing installation except important factors in design.
(b) Perform efficiently ordinary repair work.
(c) Understand the principles of plumbing and drainage outlined in the Wisconsin Code.
(d) Know the meaning of plumbing terms.
(e) Read working drawings, specifications and instructions.
(f) Understand the various types of fixtures.
(g) Know the various kinds of traps and their purposes.
(h) Understand the fundamental purposes of plumbing ventilation.
(i) Perform all work in a workmanlike manner.
(j) Know how to apply tests to old and new installations.
(k) Distinguish between insanitary and inefficient work, and the reverse.

X. Business Principles

A plumber should acquire an elementary knowledge of business principles which would include:

(a) An understanding of contract.
  1. The significance of contract.
  2. Principal elements in contract.
  3. Law of contract.
  4. Meeting of business obligations.
(b) Cost principles in business.
  1. Capital investments.
  2. Overhead charges.
    Depreciation funds.
    Insurance, etc.
    Interest.
  3. Cost of material.
  4. Cost of labor.
(c) Principles of buying.
(d) How and when to taken inventory of stock.
(e) How to estimate cost of a job.
(f) How to charge and credit job materials.
(g) How to write simple business letters and make specimen bids or estimates.

XI. Related Trade Information

The mechanic should be acquainted with the institutions and practices suggested below which concern so vitally his work in the trade:

The laws, rules and regulations governing plumbing, drainage, and water supply installations and inspection;
The functions of the State Board of Health and of local governing bodies, and the relation they bear to his work;
The functions of the Industrial Commission of Wisconsin as they pertain to his work, and the requirements of building codes;
The necessity for regulation of plumbing and other work vital to the welfare of the public;
Something of the obligations of citizenship;
The principles of trade organizations and cooperation, both of employers and employees.

Conclusion

It is essential for an apprentice to become familiar with the best published works bearing on his trade. The more varied and constant is his reading, the more capable and successful is he likely to become in the pursuit of his calling. There are several standard works on the theory and practice of plumbing. These should be read and studied. The apprentice should also read whatever books are recommended by the Plumbing Division of the State Board of Health or the Wisconsin Plumbers' Apprenticeship Board. To gain acquaintance with the best thought and latest knowledge in the plumbing industry, he should read regularly one of the excellent trade journals devoted to the craft. Above all else an apprentice should become familiar with the provisions of the Wisconsin State Plumbing Code, which govern all plumbing and drainage work done in the state.

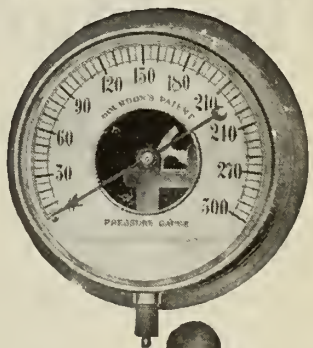
UNITED BRASSFOUNDERS AND ENGINEERS, LIMITED

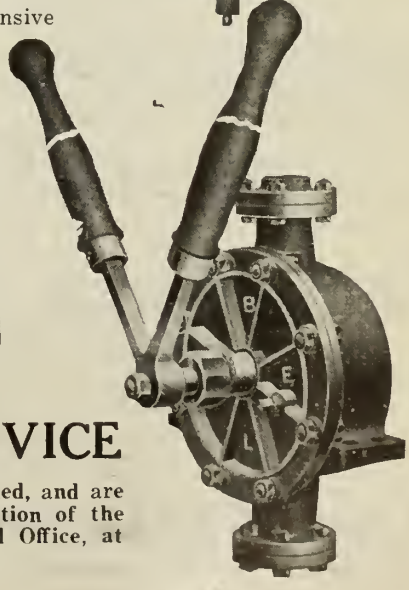
EMPRESS FOUNDRY, CORNBROOK, MANCHESTER, ENG.



DURING THE WAR our Plants have been exclusively engaged on work of supreme national importance.

WITH PEACE IN SIGHT we are pleased to announce that we intend to again direct our energies to the intensive production of:—

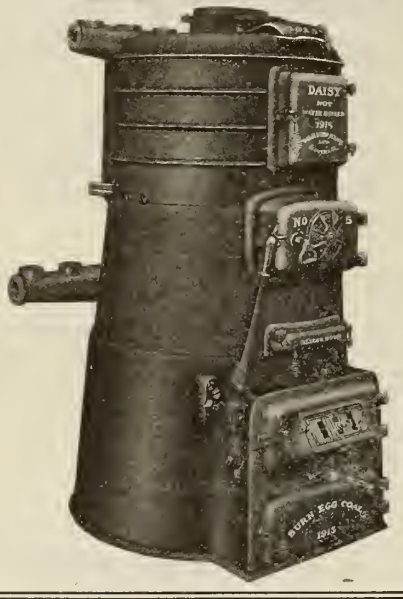
GUNMETAL and BRASS VALVES and COCKS.
STEAM, WATER and COMPRESSED AIR FITTINGS GENERALLY.
CAST IRON STOP and SLUICE VALVES.
SEMI-ROTARY PUMPS.
EXTRUDED BRASS and BRONZE BARS.
BRASS BOLTS and NUTS, STUDS and GENERAL TURNED WORK FROM THE BAR.
CAST AND MALLEABLE IRON COCKS and PIPE FITTINGS.
PRESSURE and VACUUM GAUGES.
INJECTORS and GENERAL JET APPLIANCES.
ENGINE GOVERNORS (Pickering, Proell, and Other Types).
SPRAYING MACHINES, for Insecticides and Lime-washing.
COPPERSMITHS' WORK.
"STELLA" BRAND ALLOYS: MANGANESE COPPER, SILICON COPPER, FERRO ZINC, PHOSPHOR COPPER and TIN, etc.



"UBEL" POST-WAR SERVICE

If you are interested in any or all of the lines mentioned, and are in a position to take a hand in the energetic distribution of the same, please communicate with us NOW to our Head Office, at above address.

Over 60,000 Daisy Hot Water Boilers Now in Use—Are *You* Selling Your Share?



Daisy Hot Water Boilers are easiest to sell because they have an established reputation for exactly meeting the requirements of the modern home.

Every Daisy you instal will help build bigger business by bringing repeat orders for installation in neighboring homes later.

The MacLean Business and Class Publications in Canada

TO SELL or buy from Canada such lines as machinery, hardware, food products, dry goods, books and stationery, paper, printing machinery and supplies and general merchandise of almost every description, raw or manufactured, use or consult the MacLean Business and Class Publications, as per list below. For special information, write the publishers. Concerning the quality of the MacLean publications let this copy of SANITARY ENGINEER which you hold in your hands speak for all. The MacLean list of 14 publications is as follows:—

THE CANADIAN GROCER (Est. 1886)
HARDWARE AND METAL (Est. 1889)
DRY GOODS REVIEW (Est. 1889)
MEN'S WEAR REVIEW (Est. 1898)
CANADIAN MACHINERY (Est. 1905)
THE POWER HOUSE (Est. 1907)
BOOKSELLER AND STATIONER (Est. 1884)
THE SANITARY ENGINEER (Est. 1907)
MARINE ENGINEERING OF CANADA (Est. 1910)
CANADIAN FOUNDRYMAN (Est. 1909)
PRINTER AND PUBLISHER (Est. 1892)
THE FINANCIAL POST (Est. 1907)
MACLEAN'S MAGAZINE (Est. 1896)
THE FARMER'S MAGAZINE (Est. 1910)

This fact may interest you: namely, the MacLean organization is the largest concern of its kind in the British Empire. The output of its mechanical department every working day is the equivalent of a 112-page publication of the size and type of this copy of SANITARY ENGINEER.

Our London Office, 88 Fleet Street, E.C.

Also at: NEW YORK, BOSTON, CHICAGO, MONTREAL, WINNIPEG

For over 20 years the MacLean Publishing Company has maintained a fully-staffed London office, and has rendered British and Continental manufacturers, shippers, and traders an invaluable service in many directions.

Specimen copies of the MacLean publications will be cheerfully forwarded to all asking for them. Address us at London or Toronto.

PIPE AND THE PUBLIC WELFARE

By R. C. McWANE

A Book Just Off the Press

Every sanitary engineer should be the possessor of this book. It deals with pipe-making of all kinds, cast iron, wrought iron, steel, wood and tile pipe. It is valuable because it gives the users of pipe a true idea of how pipe lasts under various conditions when in service.

This is a "Q" Foot Valve

And it Just *CAN'T* Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

Pipe and the Public Welfare

By R. C. McWane

A Book Just Off the Press

Every sanitary engineer should be the possessor of this book. It deals with pipe making of all kinds, cast iron, wrought iron, steel, wood and tile pipe. It is valuable because it gives the users of pipe a true idea of how pipe lasts under various conditions when in service.

Price $1.00 Postpaid

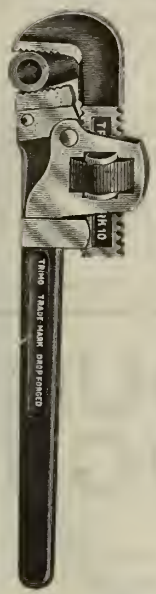
The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH



Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with wood handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

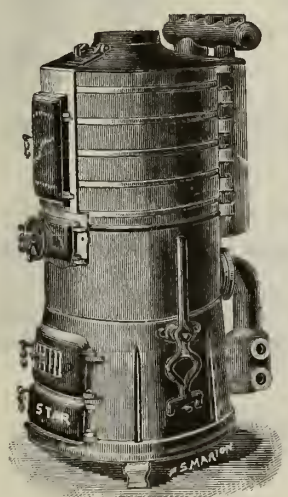
Thousands of Star Boilers in Use requiring repair Parts



It will be a long time before folks forget the coal troubles of the last few seasons.

The principal feature of the Star Boiler is that **no other round hot water boiler has any coal-saving improvement not embodied in the "Star."**

Then, too, while boiler installation and repair time is here, why not stock up with Star parts, for which O. Belanger has taken over the rights and is now making?

Many thousands of Star Boilers are in use requiring these repair parts hitherto unobtainable.

Write to us at once in time to catch the season's business.

We guarantee prompt deliveries.

O. BELANGER, REG'D.

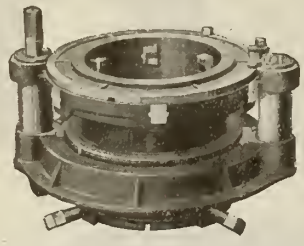
A GOOD HUSKY BOY

will thread 2½ to 4-inch pipe easily

Make Hard Work Easy and Save Time



Beaver No. 41 Threads 2½, 3, 3½ and 4-inch Pipe Without Changing Dies.

One set of dies will thread all sizes, from 2½ to 4 inches, and is adjustable to cut standard, oversize, or undersize, insuring tight-fitting joints regardless of any variation in fittings.

Just take a look at the construction of Beaver No. 41. The threaded barrel or leader screw is a separate casting from the head to minimize repair expense; gears are protected; driving pinion is supported at both ends; bronze bushings and steel castings insure longer life. Only one set of dies to buy and these may be re-ground on a grindstone.

DART Union Pipe Coupling

The kind that leaves no room for complaints and saves time

Water is nearly as destructive as fire. A leaky pipe coupling may cause considerable damage to a home, and irritate a customer.

Make your good work LAST.

The Dart Union will never leak. There can be no loosening up at the joint, because Face and Seat are of Bronze (a metal that will not deteriorate), and the heavy malleable iron parts will not expand or contract.

Dart Unions are easy to use because of the Ball-shaped Joint which enables you to connect pipes quickly, whether pipes are in or out of alignment.

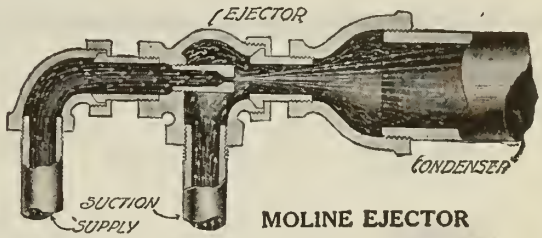
"Here's the profit on my latest heating contract.. and I'll land another this afternoon!

"GLAD to see you at this window once again, Mr. Heating Contractor! This bank is proud of a depositor like you! Say, tell me—how do you land those heating contracts so often? From all that I can hear, there isn't another contractor in town who does as much *quality* business as you do!"

"You named the secret right then, Mr. Teller. *Quality*—that's the secret of my good fortune!"

"I'm interested—do you mean that you can take any sort of heating apparatus and make it give lasting satisfaction, simply by installing it properly?"

"Not on your life! *I* make only MOLINE HEAT installations."



MOLINE EJECTOR

"Moline Heat? What's that?"

"Well, I can't take time to go into details about it just now—I've got to go after that next contract, right away—but if you can drop around after banking hours I'll be glad to show you what a wonderful system MOLINE HEAT is. It's a heating system that runs as accurately as a bank's 17-jewel adding machine—if you have such a thing. It heats *right*, year after year. Moline Heat gives me the foundation and I do the rest—*quality*, all around. 'Consequence is that each of my customers is always as proud of his MOLINE HEAT installation as a kid with a new watch—and he goes around telling everybody else about MOLINE HEAT. Each Moline Heat job brings me in another, Mr. Teller. That's where these deposits come from!"

"Well a heating system that builds up bank balances like yours must be a pippin!"

"You bet it is! Moline Heat for mine!"

Numberless Moline Heat contractors are having similar experiences.

For full particulars about MOLINE HEAT, write to us today. Address Dept. G.

Some excellent territory still open for special sales representatives.

Moline Illinois

First Cost *versus* Upkeep Cost!

The purchase price means nothing if the upkeep cost is not low.

The purchase price of King Boilers is no more than the average boiler and yet—

The consumption of fuel—*the upkeep cost* is lower—considerably lower.

The thin, peculiarly shaped waterways in the "King" mean quickly heated water and perfect circulation, which causes a saving in fuel because it obviates the necessity of "extra firing" to move cold water from the radiators.

The Trade should use this quick-heating, fuel-saving argument now while fuel is scarce and high in price.

Why Jenkins Bros'. Valves Are Superior

Fig. 106

They are the original renewable Disc Valves. They have more imitators than all other makes of valves combined. They have kept pace with increasing steam pressures and severe working conditions. They are of the simplest design, and can be easily repaired by any man of ordinary intelligence. They are made interchangeable in every part, and any part can be duplicated promptly and inexpensively by the dealer. In the majority of cases they can be repaired by merely changing the disc without the laborious task of regrinding.

Fig. 108

Fig. 114

They are recognized as the Standard Steam Valves in all parts of the World, and wherever there are supply houses—Jenkins Bros'. Valves will be found. The Standard of quality never changes except to improve, and while to-day there are hundreds of imitators, the sales of genuine Jenkins Bros'. Valves are constantly increasing.

WE SPECIALIZE IN

PIPE THREADING TOOLS

Take Another Look At This Job

ESTABLISH PEACE

If you desire to establish lasting peace in your shop, you will have to furnish your men with good tools. Men will not do the same amount of work if that work is hard. The more you *INVEST* in tools if they're good tools, the less you will SPEND in labor. To invest is to establish an asset, to spend is to create a liability. Our tools will save you money and make peace in your shop.

ESTABLISH PROFIT

Work made easy becomes a pleasure. Jardine and Toledo Pipe Threading Tools make threading pipe so easy that a boy can thread a 4-inch pipe as easily as he can thread a ½-inch pipe.

Not only so but when a thread is made with one of our tools it's a good thread. No cutting off pieces of pipe. No lost time and no leaks. That's the way to establish a profit on every job.

★STEFANSSON'S
OWN STORY *of his*
FIVE YEARS *in the* ARCTIC

Over five years ago Vilhjalmur Stefansson, the famous Arctic explorer, was commissioned by the Canadian Government to lead a party into the uncharted space that extended from the north-westerly boundaries of Canada on to the North Pole. Shortly after the party got away the news came back to civilization that Stefansson and some of his party had drifted out into the Arctic seas on an island of ice and they were given up as lost. But Stefansson came back, safe and sound after four years of amazing adventures, during the course of which he made many discoveries of scientific and geographical value. Mr. Stefansson has written his story of this wonderful journey and exclusive Canadian rights have been purchased by MACLEAN'S MAGAZINE. It starts in the April issue and will continue for six months. It is a thrilling narrative—unquestionably the most important Canadian story of the year.

★ **Stefansson's story will be published exclusively in Canada in MACLEAN'S. The series of articles by him, now appearing in American and Canadian newspapers, refer entirely to his experiences on previous explorations and do not deal with the journey that he undertook for the Dominion of Canada and completed last year.**

Other Outstanding Features of April MacLean's

"Imperial Relations Must be Worked Out," by Viscount Bryce. An important announcement on the future construction of the British Empire.

"Reconstruction in Turkey," by Stephen Leacock. A humorous article on the present condition of things in Turkey as seen by Canada's great humorist, and applied to Canadian conditions.

"Bulldog Carney," by W. A. Fraser. A splendid novelette of the Canadian West, complete in this issue. Illustrated by Charles L. Wrenn.

"Opening the New Book," by J. K. Munro. An article on the situation at Ottawa created by the new Liberal leadership—smashing, impartial, fearless.

"The Sun Gazer," by Charles G. D. Roberts. A remarkable animal story. Illustrated by Artheur Heming.

"Canada's Fishmonger General," by Thomas M. Fraser. An article on a young Canadian who put Canadian fish on the diet of the British armies by a series of Barnum and Bailey advertising stunts.

"Bombing the Boche," by Lieut. J. Vernon Mackenzie. The second of the two articles that Mr. Mackenzie has written on the whirlwind campaign of raid reprisals which so frightened all Germany.

"The Transformation," by Frederic S. Isham. Illustrated by Hanson Booth. The second instalment of this sparkling new serial.

"Man and Wife," by C. W. Stephens. Illustrated by R. M. Brinkerhoff. The first instalment of a three part story of Canadian life by a new Canadian writer—a delightful love story with a background of business intrigue.

The Review of Reviews

The best articles from all publications the world over are selected and condensed for this department. Some of the articles in the April number are:

The Man Behind Bolshevism.
Could German Fleet have been Destroyed.
The Secret Plans of the Allied Command.
Too Much Wilson.
Is the ex-Kaiser Haunted?
Next Government Will be Labor.
New Life of Deposed Princess.
A New Kind of Socialism.
Are We Communicating With Mars?
The Cohort of the Damned.
Has War Wiped Out Disease?
The Red Terror in Russia
The Sultan Takes Hold.

GALT, ONTARIO

COMMUNITY OR INDIVIDUAL ADVERTISING

The difference between community and individual advertising is that the first creates a general demand for Plumbing goods and establishes a market where the product can be sold, while the other simply draws attention to the individual article manufactured by the advertiser.

When that article is an entity in itself and can be used independently and not necessarily in conjunction with other fittings, individual advertising is good, but where the article manufactured is only a part of general equipment and can only be used in conjunction with several other fittings in order to make a perfect installation, then, in the opinion of the writer, community advertising is productive of better results.

The PORT HOPE SANITARY MANUFACTURING COMPANY, LIMITED, make Plumbers' fine enamelware, but without cast iron soil pipe, brass work or other fittings it has no material value, and while it is quite possible that by advertising enamelware exclusively we might be able to interest a number of people and direct their attention to its good qualities, and after an examination have it exclusively used in the work in which they are interested, community advertising, however, would go much further and would interest the public at large in all Plumbing material, whether it consisted of Soil Pipe, Plumbing Fixtures, or Brass Work, and at the same time create a greater demand for enamelware. It would also take into consideration water supplies and sewage disposal, and the result would be that the entire population in the field covered would have a better understanding of Plumbing work, its uses, advantages and value.

A wider distribution of Plumbing material would mean a larger field for the Manufacturer, Jobber and Contractor, and with a larger field more material would be used and there would be more business for everyone.

The foregoing is offered as a statement of the position the writer has taken in discussing this question on several occasions, and it expresses his views on the subject of advertising. Does it appeal to you? If it does, will you help? Talk it over with your jobber or his traveller, or write this office. Now is the time to start advertising propaganda. It's bound to be successful.

Sanitary Engineer
Plumber and Steamfitter of Canada

Published First and Fifteenth of Month

Vol. XIII TORONTO, APRIL 1, 1919 No. 7

The "What," the "Why" and the "How" of the B.T.U.

Written for "SANITARY ENGINEER" by N. A. KEARNS

No. I of a Series

Editor's Note.—This article is the first of a series prepared especially for the readers of the SANITARY ENGINEER, covering heating and engineering practice reduced to its simplest terms. Descriptions of installations made in different classes of buildings will be given, together with the method used in making the designs for these installations. It is not our purpose to give complicated formulas, but rather to present the simple rules that have been based on these formulas, in such a way that the reader will be enabled to design a heating and ventilating system without having to refer to the data given in engineer's hand books. The author of these articles, Mr. N. A. Kearns, has designed heating and ventilating equipment for all classes of buildings in practically every province of the Dominion. Some of the buildings were such that the heating and ventilating equipment had to be installed under the most adverse conditions, whereas in other buildings the design for the heating and ventilating equipment was incorporated in the constructional drawings. The second article of the series will appear in next issue.

SEVERAL years ago the writer was asked by a foreman steamfitter how calculations were made in determining the amount of radiating surface necessary to heat air in ventilating work. When I attempted to describe how this depended to a great extent on the nature of the installation, and endeavored, by means of a formula to make my meaning clear, he expressed the opinion that there surely was some average condition for which a rule could be made so that with this rule and a measure of common sense any fitter might estimate how much indirect radiation he should instal under any set of conditions. He said that while my formula might be clear enough to one conversant with its use, that it was anything but clear to him. In subsequent conversation with this party, I learned that he, in common with scores of other men in a like position, had made an attempt to read some of the works on heating and ventilation, but that he had given it up as a bad job on account of the "pollywogs" appearing in the formulas.

Many expert journeymen fitters will not take the time to learn the principle on which the formulas are based, and it is for these men that this and the following articles are written in the ordinary everyday language of the practical man. Perhaps in the later and more advanced articles it may be necessary to use engineering formulas. But the reader can be assured that the rules will be explained in such a manner that no knowledge of advanced mathematics will be required. So many satisfactory heating installations have been made by men of limited education that it might be argued that the intricate calculations found in engineers' handbooks are unnecessary. The answer might be made that the experienced man has a thorough understanding of the principles of these formulas and may use them everyday in his practice although he may be unconscious of doing so.

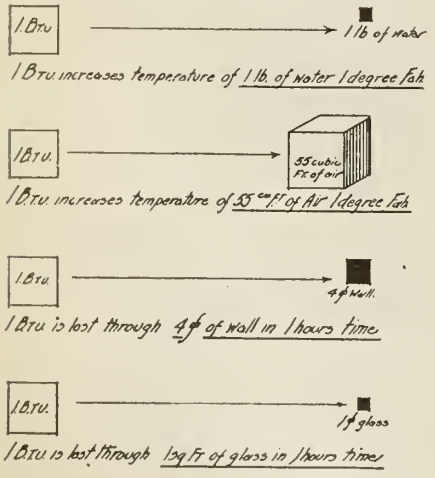
If one has a grasp of the principles used in designing any kind of work he will have no great difficulty in arranging the details. So the first thing we will try to get together on is the principles, and afterwards it will be our endeavor to describe some of the details used in the installations of various systems of heating.

Now there is one factor that we cannot pass up, and that is the measurement of the quantity of heat in any substance. With the knowledge of how much heat is required to offset any heat loss, together with the knowledge of where we can best get that required heat, we are in a fair way to design a heating system.

There is a certain measurement of heat that we term the British thermal unit (B.t.u.). This, roughly, is the quantity of heat required to raise one pound of water one degree Fahr. For illustration we will take a vessel containing exactly one pound of water, measuring the temperature of the water by means of a Fahrenheit thermometer. We will then take a small piece of iron and heat it in a fire. If this is a very small piece of iron we may heat it to a very high temperature—perhaps until it is red hot. While it is still hot we drop it into the vessel containing the water, being careful to see that we do not let any of the water escape either in the form of steam or otherwise. When the piece of iron has cooled to the same temperature as the water we take the temperature of the water by means of the thermometer and find that the pound of water has increased by just the amount of heat that was contained in the iron. Now that water has not increased to the same temperature as the iron when taken from the fire. If the iron was red hot we may assume that its temperature was about 900 deg. Fahr. and we may find that the water has just increased in temperature by 3 deg. Fahr. So now we know that a thermometer does not indicate the

quantity of heat but rather indicates what is termed as "sensible heat." You could not put your hand to that red hot iron without some discomfort, but after the iron had passed off all the heat that it got from the fire to the water you find that, although there is just as much heat in the water as there was in the iron, you are not able, by the feel of the hand, to distinguish any great difference in the temperature of the water and the temperature of the surrounding air. So temperature and heat are not the same things. We will measure our quantity of heat by the British thermal unit, and, knowing that one pound of water has increased in temperature by three degrees we can readily understand that there was just 3 B.t.u.'s in that piece of red-hot iron. If, instead of putting the iron in the water we had left that iron exposed to the air after we removed it from the fire, it would have heated 55 cubic feet of air 3 degrees in one hour, providing that there was no loss of heat from that 55 cubic feet of air to the surrounding atmosphere. Or again, if we had a brick wall, lathed and plastered, such as found in the ordinary residence, and we had placed that iron close to that wall in such a way that there could only be a heat loss through the wall, we would find that in one hour we would have cooled that iron to the normal temperature, that is, if we had just 12 square feet of wall to work on. Then again we might have a sheet of window glass, and if we placed the iron close to the window glass in the same way as we exposed it to the wall surface we would find that we had cooled our iron to the normal temperature, providing we had just three square feet of window surface to work on.

From our experiments we have come to the knowledge that it takes just as much heat to raise one pound of water one degree in temperature as it does to heat 55 cubic feet of air, and that the loss of heat through a square foot of the ordinary residence wall is just one quarter of this in one hour's time, or that the loss through one square foot of window glass is one B.t.u. in one hour. So we make a diagram like this:



1 Btu
1 lb of water
1 Btu increases temperature of 1 lb. of water 1 degree Fah
1 Btu
55 cubic Ft of air
1 Btu increases temperature of 55 cu ft of Air 1 degree Fah
1 Btu
4 sq ft wall
1 Btu is lost through 4 sq ft of wall in 1 hours time
1 Btu.
1 sq ft glass
1 Btu is lost through 1 sq ft of glass in 1 hours time

Now we have our proportions to work from.

If we always keep in mind that one B.t.u. will raise one pound of water one degree Fahr., it will be a very easy matter to figure the amount of heat required to raise the temperature of any substance one degree when we know how much more or less heat that substance requires than a like quantity of water.

The iron, when we put it in the fire, was just at the normal temperature of the room. It had no heat in itself to impart to its surroundings, but when it came in contact with the heat of the burning fuel it took up a certain amount of the heat that was being freed from the fuel by combustion and transferred it to the water or to its surroundings, as our experiments demonstrated. We could have heated the water with less waste of energy and heat had we placed the vessel containing the water right over the fire, thus demonstrating that all methods of transference of heat do not give like results. We must allow a factor for waste.

Fuels have different proportions of heat. Some fuels have more heat than others, but some fuels containing a great deal of heat can only be burned so slowly that they do not give up their heat with the same rapidity as fuels having much less value For instance, wood that liberates its heat very freely will cause a boiler to steam very much faster than coal that contains a great deal more heat, but that does not give up that heat so quickly.

The value of fuels are generally taken as follows:

	B.t.u.
1 lb. anthracite coal	14,500
1 lb. soft coal	11,600
1 lb. Connellsville coke	11,600
1 lb. charcoal	13,920
One cubic foot of gas	600
Electricity, 1 kilowatt hour	3,400

It must be borne in mind that there is no type of heating apparatus made that takes all the heat in the fuel and transfers it to the heating medium without loss. Very few heating boilers waste less than 40 per cent. of the fuel, so that in estimating the amount of heat that we get out of a pound of anthracite coal we usually figure on 8,700 B.t.u. per pound instead of the 14,500 that we might, were we sure of getting all of the heat stored in our coal bins.

The second article of the series will appear in the next issue and will describe the different rules used in calculating the quantity of heat required for different types of installations, together with a description of the nature of the apparatus used in supplying the heat.

VENTILATING THE MODERN SCHOOL

Written for "Sanitary Engineer" by N. A. KEARNS

AS THE community spirit becomes more general there is an increasing demand for the "consolidated school."

The consolidated school, as a building, is frequently superior in the way of heating and ventilating equipment to many of the schools in cities. These consolidated schools are, as a usual thing, built by men that have intense interest in the education of their children, and as a result the school boards are prepared to go their limit in providing schools that in every respect are of a very high standard.

The heating engineers in the small towns and villages are often passed over and their branch of the work given to "some firm from the city." This is probably because the board feels that the man from the city may be better fitted to do this work than the man with the shop in the nearest town.

It is not the heating part of it wherein they doubt his ability. They also know that he does sheet metal work; but when they ask him about the ventilating part of the business he generally admits that he knows nothing about it. So the board employs the other man.

It is no use to say that ventilating work is not a part of the heating engineer's business, and that it should be left entirely in the hands of the sheet metal workers. Sheet metal work is a very important part of many ventilating systems, but at that there are many ventilating plants in operation where the amount spent on sheet metal work was almost nothing. And even though the actual work in running the ducts may be the metal workers' the responsibility for the working of the plant is the heating engineer's.

The workman that knows why he is doing a thing takes more interest in his work than he who works in the dark. And when one forms a mental picture of what he is to do, his understanding of the work cannot but be an inspiration to him.

You may not secure the big work even though you are familiar with all the branches of your trade, but you have the satisfaction of knowing that you could have done the work had you secured it. The chances are that if you show the people in your community that you know your business, you will get the work to do.

There is nothing mysterious about ventilating systems. Their principles are easier to grasp than are the principles of heating, and any one with some knowledge of the heating business can in a very short time secure a great deal of valuable information about ventilating systems with very little effort.

The different systems described here are systems that have been tried out on more than one school. Some of these buildings the writer designed completely, working the ventilating system

(Continued on page 28)

Ontario Housing Act Passed

Many Regulations Included in Act Will Prove of Interest to the Trade—Certain Standards Specified—Only British Subjects Allowed to Participate

Editor's Note.—The accompanying article gives in condensed form provisions of the Ontario Housing Act, assented to on March 20. Various provisions of the Act will prove of great interest to the trade. We would be glad to have expressions of approval or criticism from members of the trade, for publication in next issue of the SANITARY ENGINEER. There are always divergent views on a subject of this kind, and an expression of opinion from practical men in the trade will be welcomed.

THE Ontario Housing Act passed its three readings during February and March and received the assent of the Lieutenant-Governor on March 20.

The Act empowers the Province to borrow money at 5 per cent. interest for twenty years from the Dominion Government, and from other persons for the same term, at such rates as may be fixed by the Lieutenant-Governor-in-Council for the purpose of lending to a municipality to provide funds for the erection of workingmen's homes.

Each city borrowing from the Province must pass a by-law empowering its council to borrow and appointing a commission to administer the loan and may limit the powers of its commission further than is done by this Act by a civic by-law if it so desire.

In a municipality of less than 100,000, the commission is to consist of the head of the council for the time being as chairman, and two or four others, not members of the council, who hold office for two years, retiring in rotation.

In a place of 100,000 the commission is to consist of five members who are appointed for five years and are to retire in rotation. The chairman is to be elected from their number.

Only British Subjects

The commission may acquire land either by expropriation or purchase within its municipality, and may lend to any company for the purpose of erecting workingmen's houses on it, or to any workingman who wishes to erect his own home. Returned soldiers and their families are to have first claim, and only British subjects may purchase at all. Those who have land of their own and wish to build on it may also be accommodated out of the funds.

To Be Paid in 20 Years

The houses are to be paid for over a term of twenty years and are to cost the purchaser the actual cost of the house plus interest at 5 per cent. for that term. Payments are to be made monthly and until their completion the purchaser shall be deemed to be a tenant, thus giving the Government all the remedies of the Landlord and Tenant Act. If the purchaser comes into default of interest he is charged 5 per cent on all payments in default and if the default continues for three months the agreement may be cancelled. The purchaser is to keep the house in repair, pay the taxes, local improvement rates and insurance.

The houses are not to exceed $2,500 in cost, but a commission may in certain circumstances allow $3,000. Houses and land together shall not exceed $3,000, but in special circumstances as much as $3,600 may be spent.

Standards Specified

The houses must be built subject to the following housing standards, according to the working of the Act:—

(A) A water closet, while not insisted on, is preferred. Any other sanitary closet may be used.

(B) No building may occupy more than 50 per cent. of its lots and where possible there must be fifty clear feet at the rear of the lot.

(C) There must be as much clear space between houses as conditions will permit.

(D) Ventilation of portions of open sloping ceilings into roof space will not be insisted on. Insulation of sloping ceilings and flat roofs may be accepted instead.

(E) It will not be insisted upon that plumbing fixtures should be of enamelled iron. Vitrified porcelain may be used. Also laundry tubs of colonial ware (glazed pottery).

The site of the houses must be planned to insure proper sanitary conditions and wholesome environment. As far as practicable each group of dwellings is to be provided with a playground.

All houses must be provided with proper means of drainage and of sewage disposal. An adequate supply of pure water must also be provided. If the houses are in the city this water must be provided from the city mains and if out of the reach of civic water mains, then from wells. In case wells are used, every precaution must be taken to insure that the water is not contaminated. If a septic tank is used in sewage disposal it must be placed so as not to be in any danger of contaminating the well.

All houses in cities must face on a street or boulevard which shall give a convenient dry means of access. In no case shall they face on a lane or alley.

No buildings shall be erected on a site which has not been properly drained of surface water, or on which there is any material impregnated with faecal matter or animal or vegetable decay until such matter has been removed and the ground surface beneath the house filled in with concrete.

In municipalities where there is a building by-law the provisions of this by-law have to be fulfilled except that the minimum standard of the Housing Act will be insisted on.

Farmers may also take advantage of this Act to build a house for their own occupation. They will be subject to all the regulations and must give a mortgage on their entire farm for the cost of the house except that in some cases a mortgage on part of the farm only will be insisted upon.

The Delegate from Ireland sends his card.

HUGE TOLL TAKEN BY GERMAN SUBS

Submarine sinkings during the war amounted to $7,773,584,458, and the number of ships sunk, 5,000. These figures were compiled by Rudder of New York and are based on the British Admiralty records, Lloyds' reports and the United States Shipping Board. Loss of life is estimated at 26,000. The financial loss equals the normal loss of 30 years.

Trade in all lines in Canada is about normal with a little improvement in wholesale, while the retail trade is reported the same, except for a slight improvement in the West.

Vice-Pres. Issues Call to Plumbers

J. E. Walsh, of Montreal, Provincial Vice-President of Canadian Society Domestic, Sanitary and Heating Engineers, Urges Plumbers to Take Greater Interest in Trade By Joining Local Organization or Assisting in Formation of One

AS war with its dreadful and agonizing consequences called forth new conditions which had to be overcome with stern and even revolutionary methods, peace, with its welcome and blessed opportunities, calls for alike new conditions which nations must be equally ready to control with well-considered and strenuous action.

A clarion call has been heard throughout the entire world, imperatively demanding that immediate steps be taken to provide for demobilization.

Canada, unprepared for war, surmounted every obstacle, and now, with the early advent of peace, Canada is striving with equal vigor to grasp every opportunity. Reconstruction and readjustment are her watch-words. Every individual, every corporation is asked to contribute to the success of the whole nation. Manufacturers, suppliers of materials, builders' exchanges and other trade associations are being reconstructed and readjusted. Concerted action is replacing individual effort; organization and co-operation, so essential to success, have come, it is hoped, to remain. Efficiency for the general good is the ultimate object.

An Important Opportunity

The natural question then arises: What are sanitary and heating engineers doing to further the cause of demobilization? Are they, like other associations, strengthening their ranks and preparing themselves to take their proper places in the universal reconstruction? The question must be answered by the individual. Are you a member of a local organization? Or, if there is no organization in your locality, are you endeavoring to do your share in forming one? If there exists an association in your city or town, do you not feel that the present demands for co-operation leave you no choice but to seek membership? And if an association does not exist in your neighborhood, do you not realize that you must organize, that you must become willing, even anxious to co-operate with your confreres in forming one? In either case the remedy is simple.

This May Help You

In the largest cities of every Province there are sanitary and heating associations, whose members are only too pleased to add to their numbers, as well as to assist smaller cities and towns in forming similar organizations. Some Provinces, moreover, are fully organized as Provinces. Ontario and Saskatchewan are the leaders in that respect and their members openly acknowledge that, to their organizations, they owe the prosperity and efficiency of their trades. The city of Toronto, in the opinion of many, boasts the most thoroughly organized and modernized society. Its genial and energetic secretary, Mr. Garrett Frankland, makes it both a pleasure and a duty to extend to fellow craftsmen of other Provinces the benefits of his experience, and is at all times prepared to supply them with any literature or advice tending to encourage and assist in the establishment of locals.

J. E. Walsh

The city of Montreal has, likewise, a splendid association, whose president, Mr. T. Latourelle, and secretary, Mr. John A. Gordon, are only too happy to be of assistance to the sanitary and heating engineers of other towns and cities.

Quebec Needs Organization

But the Province of Quebec, unfortunately, is not so well organized as some of the sister Provinces, and it is therefore to Quebec that this article is principally addressed. Associations are needed in all the cities, principally in Quebec, Three Rivers, Hull and Sherbrooke. All other towns, where possible, are also invited to form separate locals, and then affiliate with the parent body as the Canadian Society of Domestic Sanitary and Heating Engineers. The expense of membership in the Canadian society is purely nominal, the per capita tax for this year being only one dollar. Mr. John Watson, 4145 St. Catherine street, Westmount, is the Canadian secretary, to whom you should apply for application forms and other information. Always remember, that if it is impossible to form an association in your own town, you can secure membership, as an individual, in the Canadian society by simply applying on your business letter to Mr. Watson.

The 1919 Convention

This year the Canadian society will hold its regular convention in Montreal, on June 3rd and 4th. The president, Mr. Alex. Charette, of 414 Ontario street east, Montreal, extends a most cordial invitation to every sanitary and heating engineer of the Dominion to be present. He expects the Province of Quebec to have representation fully as numerous as the English-speaking Provinces, and with this object in view emphasizes the invitation to his French-speaking confreres. To them, and especially to non-members, he wishes explained that the parent body is bi-lingual, and that the discussions are carried on in both French and English languages.

This year the president of the Montreal and also of the Canadian associations are both French Canadians. Is it, then, too much to ask that all our craftsmen of French descent make a special effort to show their appreciation of the honor conferred on their race in the appointment of these gentlemen by an English-speaking majority?

Each Man's Duty Plain

At every convention, matters of vital interest are discussed from the viewpoint of the public and the sanitary engineer. This year, with its abundance of new problems, the convention will, of necessity, be more interesting and instructive than ever, so it behooves all sanitary and heating engineers, members and non-members, to make immediate arrangements, so that nothing will prevent their attendance in Montreal on June 3rd and 4th next.

Yours very truly,

(Sgd.) J. E. Walsh.

DEPARTMENT STORE DELIVERS GOODS BY AIRPLANE

What is described as being the first load of merchandise ever delivered by airplane from a department store to a customer was sent last week by Lord & Taylor of New York to a suburban customer. The shipment consisted of a bungalow bed, floor lamp, fireless cooker, three pillows, two dozen linen napkins, two table cloths, a dozen Turkish towels, one taboret, one carpet sweeper, one percolator, and a 9 x 12 rug.

A duplicate shipment, together with airplane engine, displayed in Lord & Taylor's store on Fifth Avenue, drew crowds of curious shoppers.

Be a Booster for the Convention

THE next convention of the Canadian Society of Domestic Sanitary and Heating Engineers will be held on June 3 and 4, in the Caledonian Club Rooms, 101 Burnside Place, Montreal. The executive committee will meet at 9 o'clock on June 3, and the regular session will be called at 2 p.m. the same day. New by-laws have been printed and are now up-to-date, with all amendments made at the London convention included. All those interested in the trade and wishing to secure copy of the new by-laws will receive same by applying to Mr. John Watson, sec.-treas., 4145 St. Catherine St., Westmount, Montreal. The sec.-treas. has recently sent out a letter to members of the society as follows:—

"We take the liberty of writing you on a subject which is most vital to our trade and calling, and would ask you to read this letter and consider if it would be advantageous to you to be one of our number. The objects of the Canadian Society of Domestic Sanitary and Heating Engineers are as follows:—

"This society is organized for sanitary heating, commercial and social purposes, and has for its special object the advancement of trade in all its latest discoveries of science appertaining to sanitary heating laws; to promote and combine the interests and influence of members for the protection of trade against imposition, injustice or encroachment upon our common rights and interests, encouraging inventions and improvements in sanitary appliances fostering an interchange of thought, and electing and communicating for the benefit of every member the best talent and the result of the experience and ability of all; to promote amicable relations with employees on the basis of mutual interest and equitable justice to both journeymen and master plumbers; to encourage Dominion and Provincial legislation for the interest of sanitary laws; to secure for the members of the trade equitable treatment in their dealings with manufacturers and dealers in supplies; to regulate the system of apprenticeship and employment, so as to prevent as far as practicable the evil growing out of deficient training in the responsible duties of selecting, arranging and fitting up materials relating to the hydraulic and sanitary heating conditions of dwellings, public and private institutions; to create and maintain a sanitary code in as high a standard as the progress of science (chemical, philosophical and mechanical knowledge) teaches, and we agree to carry forward with tireless zeal the work to which the foregoing statements relate.

"We are holding our Annual Convention in Montreal on the 3rd and 4th of June and would be pleased to have any of our craft who are legitimately carrying on the business of plumbing and heating at this meeting. We would much prefer that you establish a society in your city or town and then send some delegates to the convention, but if preferred any individual can join up with our society at a cost of one dollar for this year, all that is required is a letter from you on your letterhead paper making application for membership. We will then send you a copy of our by-laws and if you approve of our method of doing business the cost of same will be one dollar per member which pays your capitation tax up to the Annual Convention. Hoping you will seriously consider this matter as it is of vital importance to all in our business,

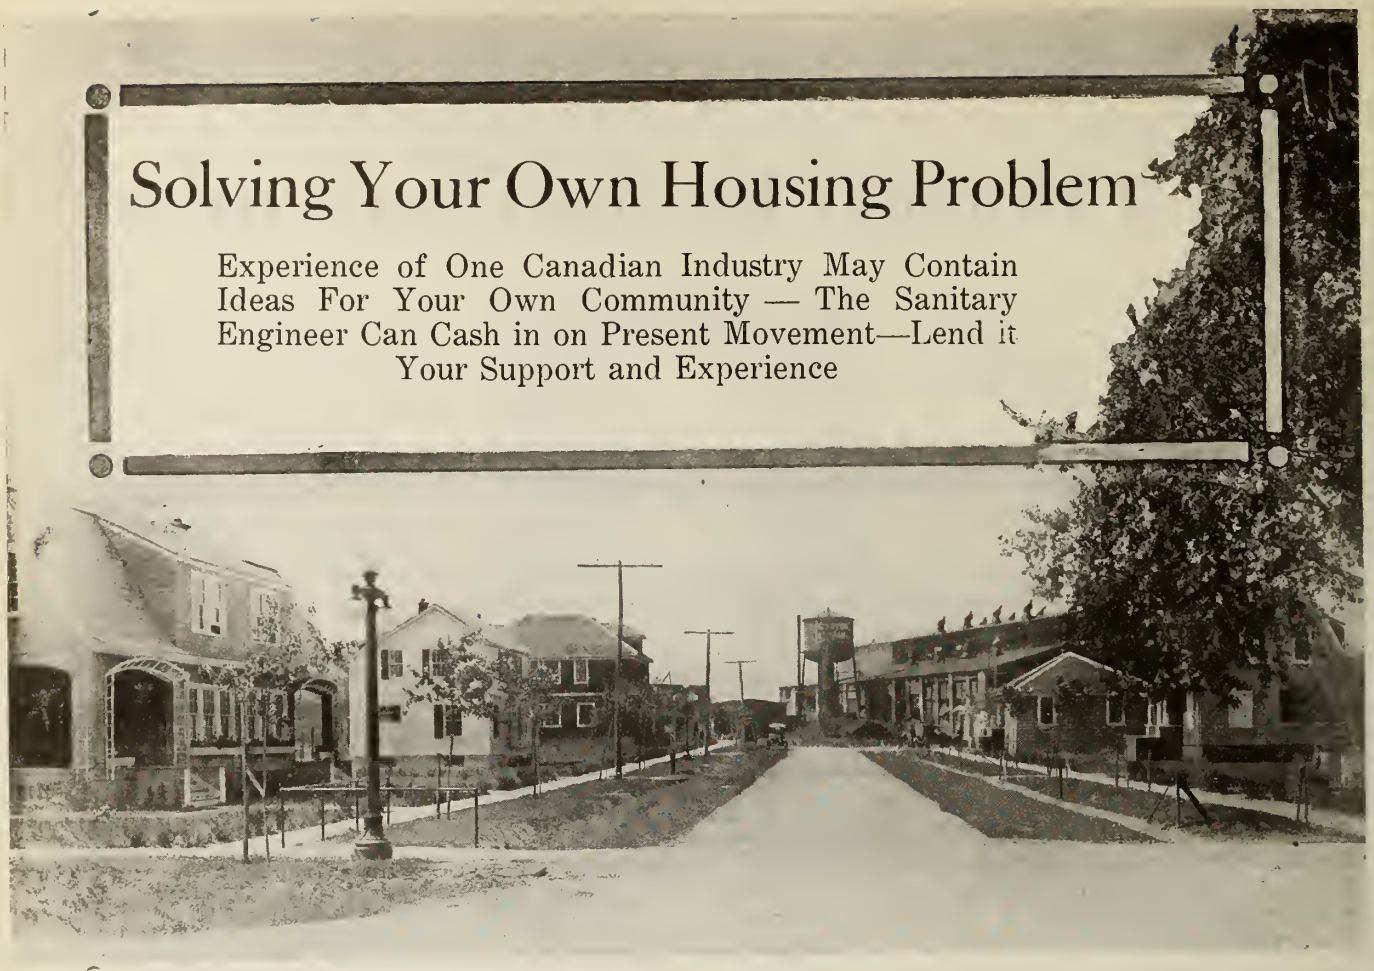
Yours truly,

JOHN WATSON,
Secretary."

The foregoing letter from the secretary outlines concisely the aims and objects of the association. The advantage of men in the same section of trade getting together, meeting one another, and talking over matters of mutual interest, cannot be over-estimated. It engenders a spirit of co-operation throughout the whole trade, which makes for better conditions and better business. The effects are not only immediate, but permanent. It is something like dropping a stone in a pond. The circle is ever-widening, and in this case it is an ever-widening circle for the good of the trade. While good results immediately from gatherings such as will be held in Montreal, the benefits are spread over months or even years.

Solving Your Own Housing Problem

Experience of One Canadian Industry May Contain Ideas For Your Own Community — The Sanitary Engineer Can Cash in on Present Movement—Lend it Your Support and Experience



THE Housing Problem is not confined by any means to the larger cities, but is a vital question in practically every town in the country. The idea of this article is to show the steps taken by one industrial firm to solve their own employees' problems in this respect and perhaps suggest something which the local merchants can bring to the attention of their local town council or local firms as a suggestion for their activities during the present year. It is not too early to "start the ball rolling" and the sanitary engineer stands to benefit by lending his support and influence to any housing scheme which may be instituted in his own community.—EDITOR'S NOTE.

THE housing of the workman is receiving a large amount of attention, and justly so, for the industrial developments of the last few years have to a large extent altered conditions formerly encountered. Many industries have sprung up in districts remote from large centres, and even the cities themselves have felt the pressure incidental to the increased numbers of workers in the munition plants, which have been operating in such large numbers. The Governments of many of the Allied countries have taken considerable interest in this phase of labor problem, and many firms have themselves gone to considerable expense to create satisfactory conditions for their employees.

One of the most interesting of these private housing schemes has been worked out by the Norton Company, both in Canada and in the United States. In this article the industrial community created by the Norton Company shows the developments which have recently been completed at Chippewa, where the Canadian plant of this company is located. There may be some feature of particular interest which can be adapted to your own community and the sanitary engineer is one who is sure to benefit in proportion to the interest he shows in the present housing problems of his town.

The location of the Norton Co. at Chippewa, Ont., while ideal from the standpoint of power supply and industrial facilities, was somewhat at a disadvantage as regards housing conditions for employees. Houses were scarce and unsatisfactory, and rents were high, necessitating the employees living at Niagara Falls and coming to work by street car, the night shift having a car service at only one hour intervals.

To ameliorate these conditions the company started a comprehensive housing scheme in 1916, the major portion of which has recently been completed. Land, which was formerly a cow pasture and swamp, is now filled in, graded, with well built roads and lighting, and forms the nucleus of an exceedingly attractive community. How many towns have these "beauty" spots that are an eyesore to the residents and create a poor impression on the visitor?

Layout

The community is located somewhat to the south of the plant and centres around a new cross street, which intersects the main approach to it.

This street, together with that leading to the plant, has been graded, paved, sidewalks put down and made attractive by the planting of trees and the wise utilization of those already grown to full size. An additional pavement has also been put down for the space of several blocks to provide a satisfactory means of entrance from the village of Chippewa proper.

The types of houses developed by the architects, Wright and Kremers, of Niagara Falls, N.Y., are vastly different from those usually met with in industrial communities. All too frequently in new developments one sees block after block of houses the same in every respect, closely jammed together and with no attempt made to relieve the monotony by varying the architectural features of individual houses, if, indeed, they have any.

In the development here described, the value of plenty of yard space for each

unit was well considered. Each house, or double house, is set well back from the road, with an ample back-yard, and a uniform street line has been carefully avoided. In a typical block the central feature will be found to be a double house of substantial appearance, set well back from the road. On each side of it the houses approach the road more nearly, the corner houses of each block being the nearest to the street line. The houses are symmetrically disposed as regards their type on each side of the central feature, or double house, and while this is done, the exterior features are arranged in such a manner that no appearance of similarity exists. One house may have shingled walls, and its counterpart in plan will be given an entirely different appearance by the use of clapboard siding, and a different verandah treatment.

The Vanished Backyard Fence

That eyesore of the city and town, the backyard fence, is only conspicuous by its absence, and the hedges, which have been planted in its stead, will, with each passing year, grow more attractive and will make the backyard a place of beauty, instead of a depository for ashes and tin cans.

Along with this improvement goes one which also helps towards the attractive appearance of the community. No one will admit that the twice a week appearance of ash and garbage cans on front lawns is an aid to civic beauty. This has been avoided in the present instance by the provision of a through lane, serving every house in a block. Through this lane all coal is delivered and all garbage collected. The garbage cans are chained to posts so that their removal is a matter of some difficulty.

Sanitary Provisions

Since the Village of Chippewa has no sewage or water systems, the company have considered it good policy to provide both for the community which they have established. Every house is connected to the sewage system, or rather to two systems, for the rain-water collected from the roofs is drained into a separate sewer, which also takes the waste water from the plant. The sewage in a separate system is taken care of by a septic tank before being discharged into the river. The separation of storm water from sewage relieves the septic tank from the excess water and allows it to function properly.

The water system, which supplies both the plant and the private houses, draws its supply from the Welland River. A duplicate chlorinating plant is installed, a vital necessity when it is considered that even "the bright, sparkling well water" of the village was highly contaminated with organic matter and at times a dangerous source of typhoid.

The chlorination of all water used in both the private houses and the plant removes the possibility of infection from this source.

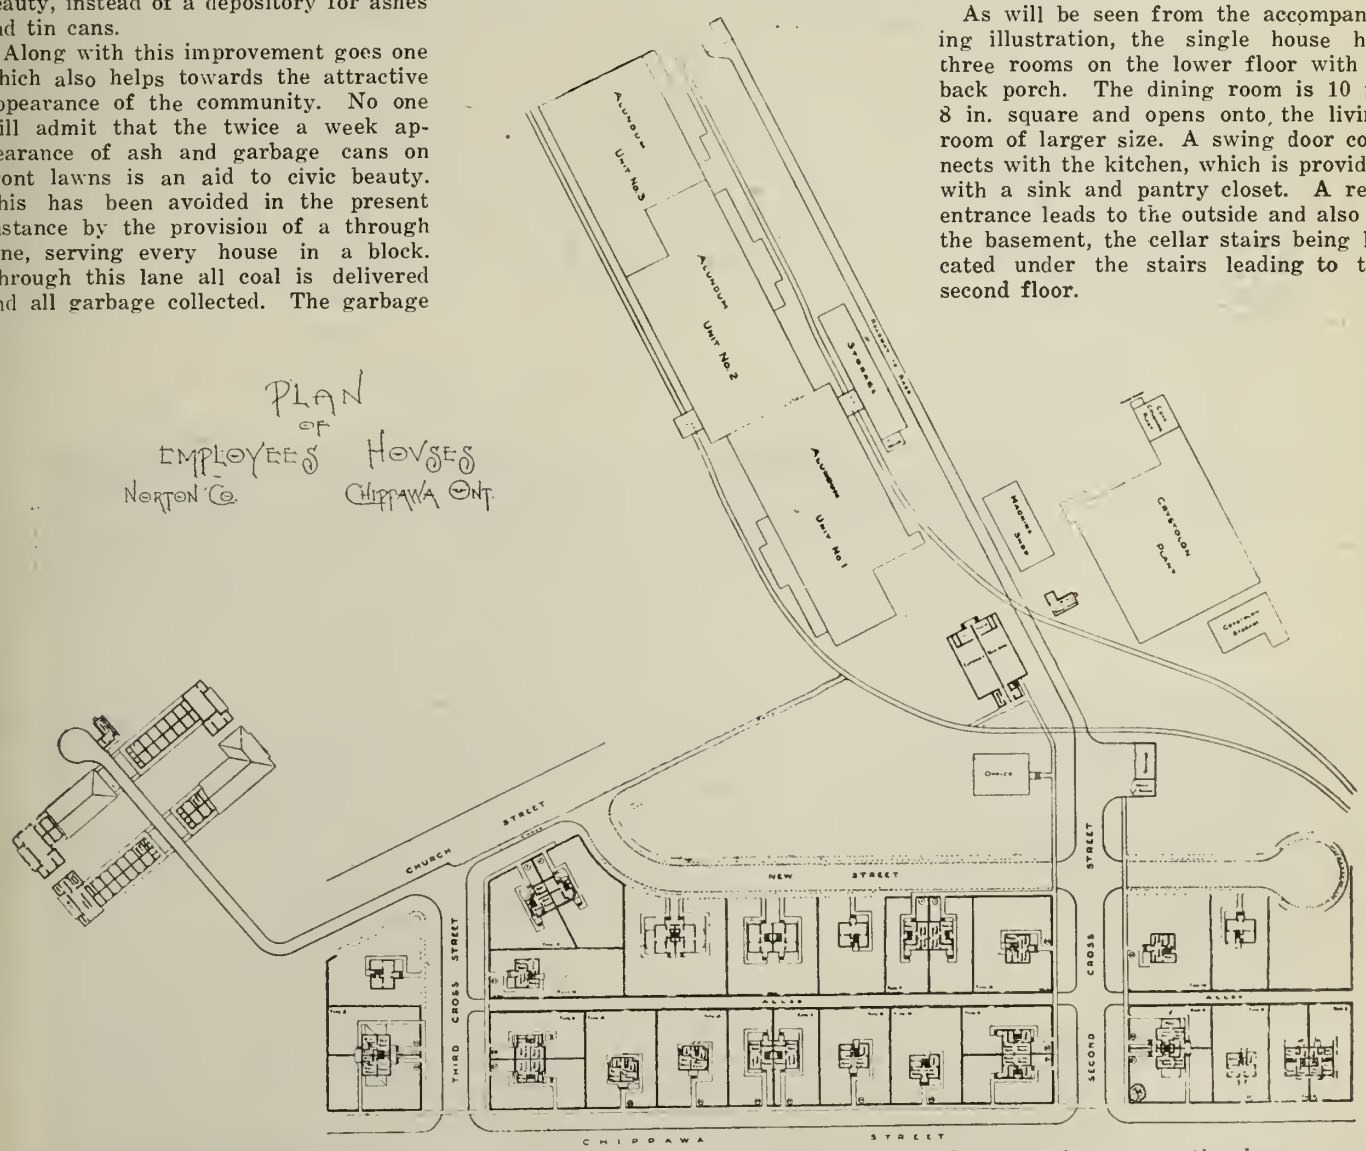
Fire Protection

For the protection of plant and community from a fire, a fire department has been organized with hydrants located at proper distances apart. Two volunteer fire companies have been organized and are provided with a hose reel and a chemical wagon, housed in an attractive station. Fire alarm boxes of the break glass type are located on the ornamental lamp posts. These boxes serve to operate an indicator in the fire hall, and also operate an electric siren at the plant. This signal gives the operator at the pump house notice to boost the pressure.

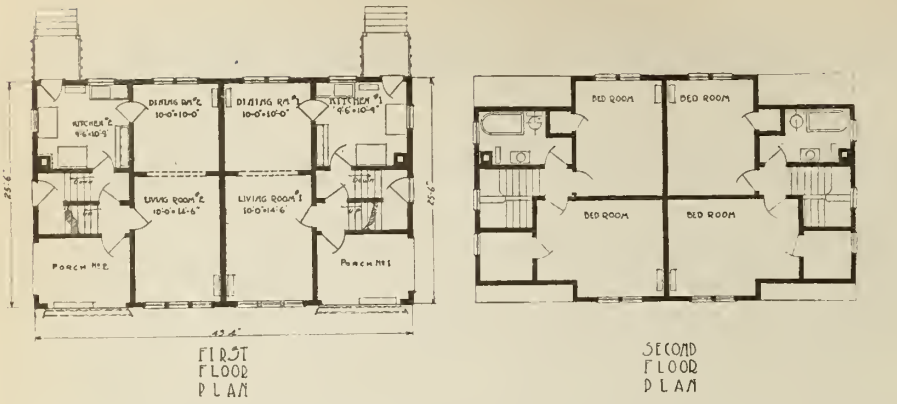
Too many towns to-day neglect to have a proper fire protection system. Hundreds and thousands of dollars could be saved were better fire fighting apparatus available. The saving in insurance rates covers the cost of proper equipment to fight this dreaded menace.

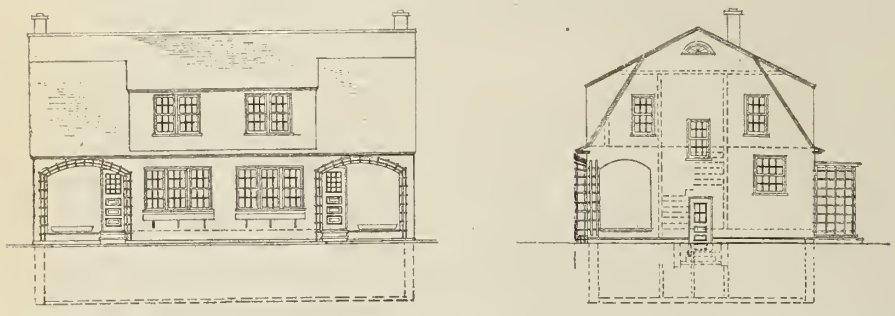
Plan Arrangement of Houses

As will be seen from the accompanying illustration, the single house has three rooms on the lower floor with a back porch. The dining room is 10 ft. 8 in. square and opens onto the living room of larger size. A swing door connects with the kitchen, which is provided with a sink and pantry closet. A rear entrance leads to the outside and also to the basement, the cellar stairs being located under the stairs leading to the second floor.



Plans for housing development at the Chippewa plant of the Norton Co. There may be a suggestion here for beautifying some unsightly part of your own community.





Plan and elevations of the typical double house . Many builders favor this Type and it has advantages.

The second floor contains three good-sized bedrooms and bath, closet space being provided for each room.

The double houses are arranged on a slightly different plan, the stairs leading to the second floor from a small hall, instead of directly through the living room. A front porch is also provided, instead of one off the living room. The kitchen is directly off the hall and opens into the dining room through a swing door. The bedrooms upstairs are only two in number, but are of generous size.

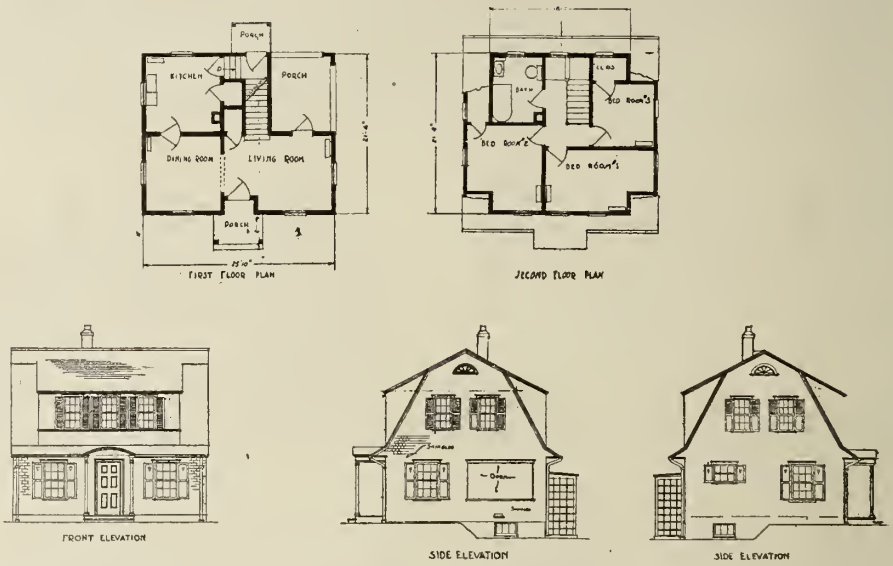
The double house admits of slight variation in plan, several different arrangements being used. All the houses are heated by hot air, and all are provided with conveniences and electric light. Their popularity with the working staff is such that there is a waiting list for houses, which from time to time are vacated.

In order to make provision for those employees who are unmarried the company found it necessary to take over the old Baltimore house in Chippewa, a frame building which has existed for a good many years, for almost a century in fact. The interior of this building was completely remodelled, a new veranda built and other alterations made, which resulted in a very comfortable home for employees who wished to take advantage of it.

The housing problem is a real one today and, by giving it all the encouragement possible the trade stands to benefit by the sale of merchandise and—not the least point to be considered—a better community to serve.

CITY BUILT OF ZINC

Bareira, in Portuguese East Africa, is the only zinc city in existence. Zinc is the only material capable of withstanding the peculiar climate. It took some thousands of people who make up the population only six months to build the place. Hospital, church, arsenal, and every dwelling is of zinc; and even most of the railway cars are zinc throughout.



Plan and elevations of typical single ho use. There may be an idea here for your own community builders.

View showing typical houses, Norton D evelopment Co., Chippewa. This class o f house is a credit in any town or city. Making this old world a better place t o live in is not such a bad idea.

Warns Prospective Purchasers to Watch Terms of Bulk Sales Act

H. G. KELLY, Toronto manager of R. G. Dun & Co., in a recent interview pointed out the necessity of added care in operations pertaining to the purchase of stores in Ontario—owing to the operations of the Bulk Sales Act that has recently come into force.

"It is possible," he said, "that many returned soldiers will, within the next few years, engage in business on their own account, in many cases buying out established ventures. It is to be feared that some of these transfers, particularly of small businesses, etc., will be made in a more or less informal manner.

"It would be a great pity if any of these returned men, through not understanding legislation which has occurred in their absence, should lose their savings. I refer particularly to the Bulk Sales Act now in force in this Province.

"I have knowledge of several instances which have already occurred, where the transfer has been made without the knowledge of or attention to the provisions covering bulk sales of merchandise stocks. It is to be hoped that purchasers will protect themselves in these transactions, with good legal advice and guidance, which should be their only proper course."

Operations of Bulk Sales Act

Under the Bulk Sales Act, it is the duty of every person who buys any stock in bulk, for cash, or on credit, before closing the purchase, and before paying any part of the price in excess of $50, before giving any note or security for the price to demand and receive from the vendor a written statement verified by a statutory declaration of the vendor, containing the names and addresses of all the creditors of the vendor, and the amounts of the indebtedness or liability due and payable by the vendor to each of the creditors. If there be a failure to obtain the statement, the sale is deemed to be fraudulent and is void as against the creditors, unless all the creditors are paid in full out of the proceeds of the sale. The purchaser, upon obtaining the statement, shall either obtain a written waiver from the creditors of the vendor, or shall pay the whole of the purchase price, or deliver his notes or other documents securing the price into the hands of a trustee for distribution pro rata among the creditors of the vendor, subject to any preferences provided by law or by previous contract.

If the purchaser shall fail to observe the requirements in respect to the trusteeship, without obtaining the written waiver of the creditors, the sale is deemed fraudulent and is void as against the creditors of the vendor, unless all the creditors are paid in full out of the proceeds of the sale. Any sale or transfer of stock, or part thereof, out of the usual course of business or trade of the vendor, or whenever substantially the entire stock of the vendor is sold, or whenever an interest in the business or trade of the vendor is sold, or conveyed, the sale, transfer or conveyance is deemed "a sale in bulk," within the meaning of the Act. But if the vendor produces and delivers to the vendee a written waiver of the provisions of the Act from his creditors having claims of $50 and over, representing 60 per cent. in number and value of the claims of $50 and over, as shown by the statutory declaration, then the provisions of the Act do not apply.

FRED ARMSTRONG, LIMITED. ASKS FOR FACTS

An appeal that the full facts be brought out at the probe of the accounts of the Board of Education was made by R. S. Robertson, who represents Fred Armstrong, Co., Ltd.

Mr. Robertson explained that his client took the view that only the evidence which was introduced by Shirley Denison, K. C., was before the commission and that other evidence could be produced by the tradesmen concerned in the matters which are under investigation.

Mr. Denison disclaimed any desire to shut out any evidence which anyone desired to lay before the commission. Mr. Justice Lennox ruled that he would make no general decision, but would consider each case on its merits as to whether or not outside counsel and witnesses be admitted.

Current Events in Photograph

AIR DELIVERY OF SOLDIERS' LETTERS

A regular aeroplane service between England and the Army of Occupation in Cologne has been inaugurated by the 120th Squadron of the Royal Air Force. The photo shows a big bag of mail being loaded into one of the high-speed machines at Folkestone. A few hours later the letters will be dropped at Cologne. The tag is enlarged in the photo.

Vol. XIII. APRIL 1, 1919 No. 7

AN ENLARGED PROGRAM

THE SANITARY ENGINEER, PLUMBER AND STEAMFITTER OF CANADA has practically completed arrangements for a greatly enlarged editorial program. In addition to the many technical articles which have always been a prominent feature of the SANITARY ENGINEER, a considerable amount of space will be given to buying and selling problems; display and advertising methods; business systems; account collecting; cost figuring systems; illustrated articles showing modern display departments of Canadian plumbing shops; illustrated articles on installations; articles on salesmanship, arranging of selling prices, and also a series of splendid articles on merchandising of sanitary, heating, lighting and electrical goods. Special attention will be given to sanitary and heating arrangements of farm homes, housing systems, theatres, schools, hotels, factories, municipal buildings, etc.

An enlarged service will also be given on news of the trade, national and local association news, and business topics and problems of the day. The foregoing are only a few of the editorial features to be included in the editorial department of the SANITARY ENGINEER in future issues. We will always welcome suggestions from readers as to how the paper may be made more valuable.

The first of a new series of articles on heating and ventilating appears in this issue, and in succeeding issues we will have several new and important announcements to make to our readers. Readers will, no doubt, observe several changes in the style of make-up of this issue compared with previous issues, and these are only the first of many changes to be made in our paper. Watch the next issue for some of the most interesting articles you have ever read on subjects in which you are vitally interested.

THE NIGHTMARE OF COMPETITION

THE merchant who listens to the contention of a customer that he can buy certain goods cheaper elsewhere, and thereupon starts out on a campaign to see if he cannot reach bottom quicker than the other fellow, is certainly wanting in a sense of proportion. It is possible that the merchant's price may be too high, but if it is figured on a real understanding of business, this is unlikely. It is possible, too, that the customer is using the same old bait that has been so often used to obtain favored prices. In any event, it is an item of comparatively small moment. The merchant who will spend as much time and energy devising constructive ways of selling his own goods as he does to "meeting competition" will have little competition to meet.

FEATURES OF THIS ISSUE

FIRST article of new series on heating and engineering practice, by N. A. Kearns.

* * *

Details of the Ontario Housing Act which was recently passed.

* * *

Message from Vice-President of Canadian Society Domestic Sanitary and Heating Engineers.

* * *

"Be a Booster." Read the article on the coming convention.

* * *

"Solving Your Housing Problem." Illustrated article giving experience of one Canadian industry.

* * *

Warning re Bulk Sales Act.

* * *

What other members of craft are doing.

* * *

"Master Plumbers Throw the Stanes."

* * *

Details of proposed new Department of Health at Ottawa.

What Others Are Doing

Items of Interest Picked up Here and There Among the Trade—What Members of the Craft Are Doing in Various Parts of Canada.

A. E. Hayman, of Stellarton, Nova Scotia, in addition to featuring his plumbing business, is advertising enamelware, stoves and ranges, washing machines and second-hand stoves.

* * * * *

Livingston & Moodie, of Barrie, Ont., in addition to their plumbing business, are advertising a full line of electric fixtures, bulbs and wire, also an electric steam radiator and vacuum cleaners.

* * * * *

C. R. Hagen, Welland, Ont., who calls himself "The City Plumber," emphasizes in his advertisement that his work is guaranteed and that he will give estimates cheerfully and attend to repair work promptly. The name of T. Harrison as engineer is featured in the advertisement.

* * * * *

B. S. Maltby, Newcastle, N.B., is advertising to his customers that now is the time to get their repair work done before the spring rush commences. Mr. Maltby emphasizes the fact that at the present time he can give prompt service to his customers.

* * * * *

Walker & Halberton, Plumbers and Gasfitters, of Lethbridge, Alta., are advertising estimates on repair work. They announce they can install and fix everything in the plumbing line from cellar to garret, and what is more, can see that the roof does not leak.

* * * * *

Frost Bros., Moose Jaw, Sask., use an illustration in their advertisement showing a plumber at work and announce that they are ready to do promptly plumbing, heating and tinsmithing. They also announce the agency for a furnace which is advertised as gas, smoke and dust proof.

* * * * *

D. N. Flander, of Ingersoll, Ont., in his advertisement asks his customers if they need a new stove or plumbing. Gas ranges are quoted from $22.00 upwards, and a full stock of granite and tinware is referred to in the advertisement. Mr. Flander stated in his advertisement that he will accept bonds in payment of purchases at his shop.

* * * * *

F. C. Kulow, Tinsmithing and Plumbing, Port Colborne, Ont., is using his newspaper advertising at the present time to feature ranges and heaters. He states in his advertisement that many of these ranges have already been installed in kitchens of Port Colborne and ends his advertisement with the question, "How about one for your kitchen?"

* * * * *

D. Howe, successor to Howe & Anderson, Ingersoll, Ont., advertises to the public that when water, steam or gas pipes need repairing or renewing they have simply to call him up and the work will be attended to immediately. Mr. Howe emphasizes the fact that customers should keep the phone number where they can find it instantly and call up his firm when in need of prompt service.

* * * * *

James J. Fitzpatrick, "The Market Square Plumber," at Trenton, Ont., emphasizes the fact that his records prove that all the installations of plumbing and heating which his firm has handled have given entire satisfaction. He further emphasizes the fact that "We are proud of our record, and you can depend upon receiving the same satisfactory service at any time you need it and at sensible prices." The advertisement, while occupying only moderate space, emphasizes in the heading, "Dependable Plumbing and Heating."

* * * * *

Fred Uncles, Plumbing and Heating Contractor, Newcastle, N.B., is making a special feature of the electric fixtures, particularly for store lighting. A well-written advertisement points out the advantages of having good lights in stores and particularly the kind advertised in the advertisement by Mr. Uncles. Ranges, heaters and electric fixtures are also featured in this advertisement. The slogan of this firm is: "You Get Satisfaction and Your Money's Worth When You Buy From Me."

* * * * *

The Simcoe Plumbing and Heating Company of Simcoe, Ont., carried on a clearing sale during March on the ground that they could not get inside help and must devote more time to their shop. The company advertised a great many lines of shelf goods which they wished to dispose of and they also urged their customers to bring along their mail order catalogue and if the mail order price was cheaper than anything which they had in stock they would give the person pointing it out that article free. In their advertisement they emphasized the fact that many of their lines are cheaper at their regular price than the mail order house prices at the supposed cut price.

* * * * *

Yagg, Wilson & Company, Regina, Sask., used considerable space in local newspapers during the farmers' convention which was held in Regina, and featured modern plumbing and hot water heating systems for rural homes. The advertisements were splendidly illustrated, and in one advertisement names were given of forty rural customers who had work done by this company. Yagg, Wilson & Co. suggest that enquiries be made from some of these rural customers and get their opinion of systems which have been installed. Another very attractive advertisement contained two testimonial letters from highly satisfied customers. The advertisements are very attractive and effective and create a splendid impression owing to the many facts outlined in the advertisement and the use of the splendid testimonials from customers who are apparently well satisfied with the work done by this company.

PRACTICAL SHEET-METAL WORK

THREE PIECE ELBOW WITH GUSSET OR GORE PIECE.

BY THOMAS STANSFIELD

THE article described in this issue, for which a pattern is to be developed, is of somewhat different line to any other previously shown, that of a one-piece pattern for a garbage, or ash chute. Not only can it be used for a chute, but also for a round to square branch of a furnace pipe; it sometimes is necessary to make a Y branch from round to square fan system piping. However we will call it a chute outlet, the square being the lid or inlet to the chute.

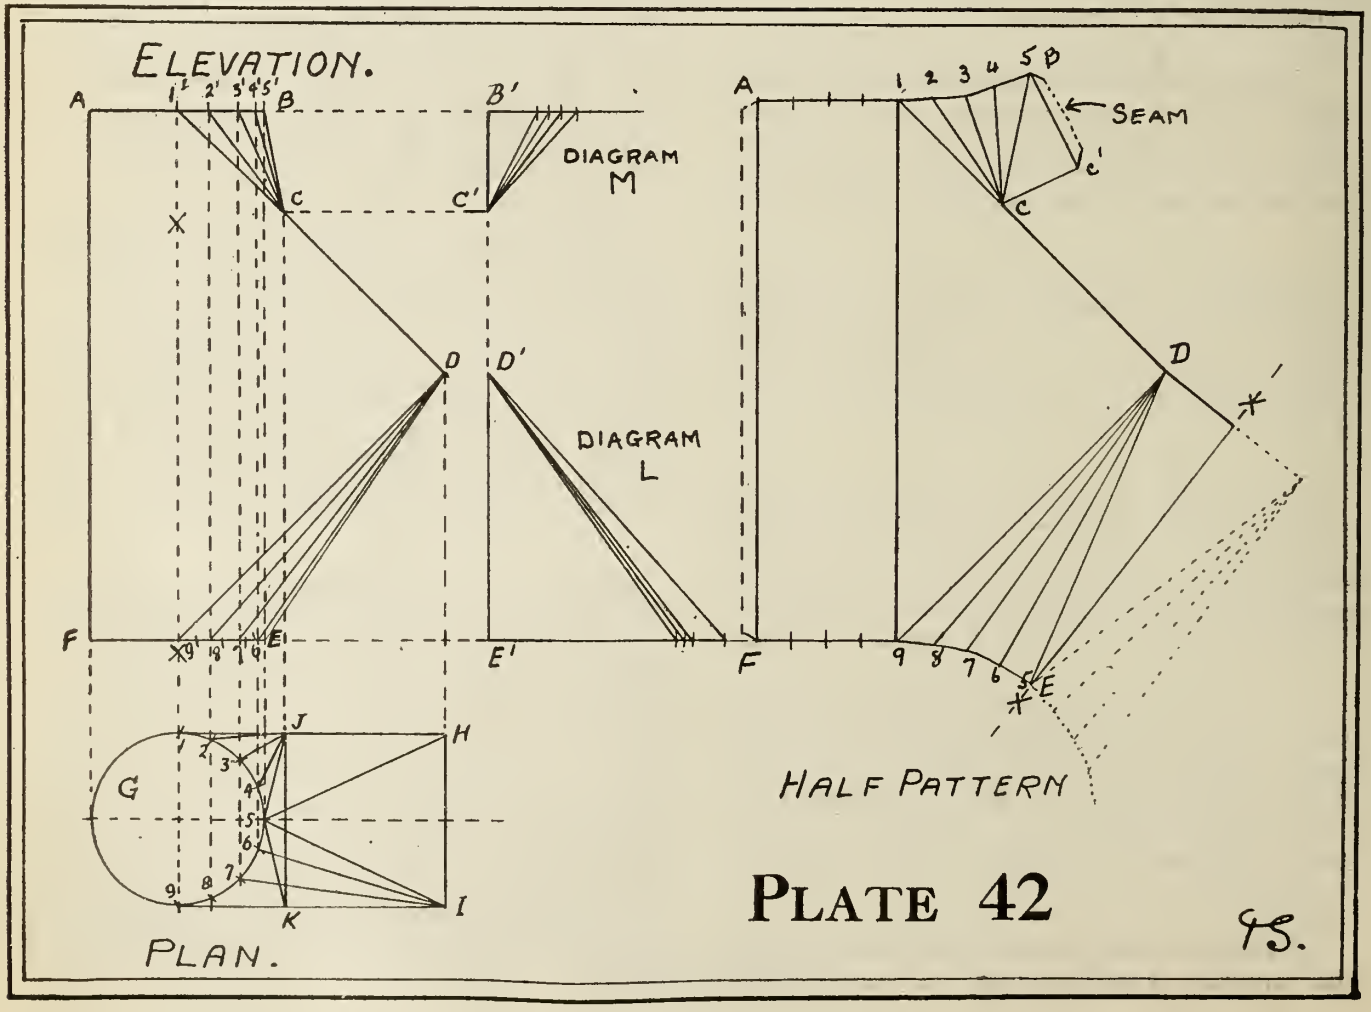
First, determine the diameter of the round part, and draw the plan G and from sides of circle project lines upward as shown at A B F E. Then draw centre line X X, cutting through centre of line F E from centre of circle G. Now take a 45 degree triangle and draw a line from X on line F E, as shown at D, and again draw line D C by reversing the position of the 45 degree triangle. It will be seen that the sides from X to D to C form nearly two sides of a square. Now divide the right hand side of the circle G into 8 equal parts. It will be noted that the line C D is simply the length of the side of square opening and may be any length. Next drop a line from C describing line J K and again another line from point D until the line H I is drawn. Now connect J and H, K and I. To complete the elevation, draw lines from points 9 1 to 9^1, which is the centre of both plan and elevation. Next draw line from 8 2 to 2^1, and so on until all the dotted lines shown are completed.

The next step is to find the true length of lines C, 5^1, 4^1, etc., and D E, 6^1, 7^1, etc., then draw the triangular lines from points H I J K to the circle G, 1, 2, 3, 4, 5, 6, 7, 8, 9, viz., H to 5 and J to 5, 4, 3, 2, 1, and K, 1 to 5, with I to 6, 7, 8 and 9.

It will be noted that only one-half the pattern is developed, but it is simply a matter of turning over the pattern at points X X to complete.

First, lay off two lines the length of A F in elevation and the same distance apart equal to one-quarter of the circumference of the round piece, see A, F, I, D in pattern, next develop the

Continued on page 26



RECLAMATION ACT PASSED

Bill No. 9, an Act to authorize the reclamation of Dominion Lands by drainage, was passed by the House of Commons, on March 24.

Under the Act the Minister of the Interior of Canada, shall have power to reclaim vacant Dominion lands situated within the limits of the Provinces of Saskatchewan and Alberta by drainage works, and to defray the cost of investigation, preliminary survey and the construction of such works out of moneys set apart by Parliament for that purpose, and may include in such reclamation any lands other than vacant Dominion lands that will, or may be, benefited by such drainage works, and may assess the cost of reclamation, including therein the cost of investigation and preliminary survey, upon the said lands, other than Dominion lands, in the manner provided by the drainage laws of the Province in which the lands are situated.

CHLORINE TREATMENT TEMPORARY MEASURE

Defects in the System Render it a Constant Danger to Public Health

Temporary measures frequently become temporizing measures. Expert opinion has asserted time and again that the disinfection of a contaminated water supply by chlorine should never be adopted as a permanent policy. Instead, according to conservation, every community should earnestly endeavor to obtain a pure water supply, either directly, or by means of filtration. Unfortunately, however, many centres, having once adopted the chlorinated water expedient, are loath to provide a permanent system. In brief, a temporizing policy is adopted and is followed until an alarm is sounded in the shape of a flourishing little outbreak of typhoid.

American engineers, state the Ottawa bulletin, have been the leading exponents of the chlorinated method of treating water. It is but natural to expect, therefore, that the system would be most highly perfected in the United States. Nevertheless, during the past few months, cases have come to light there that illustrate some of the inherent defects of the method. At Milwaukee the offensive taste from the chlorine in the water was intensified by the gas-house wastes. Conditions were such that it was even suggested to revert back to the old method of individual boiling of the water, instead of sterilizing at the pumping station. The futility of attempting to have every citizen boil the water used for drinking purposes has long since been demonstrated. The most serious aspect in this instance, and one which may serve as a warning to other places similarly situated, is that an employee at the pumping station, to whom complaints had been made, eliminated the chlorine treatment for a 12-hour period. As a result the mains became filled with contaminated water and there was an increased typhoid incidence. Milwaukee is now trying experiments in water filtration and the conclusions that will be reached when these have been completed are being awaited with keen interest.

At Xenia, Ohio, a small typhoid epidemic was started recently owing to the inferior quality of the chlorine powder used in the water supply. There, too, a movement is on foot to procure from another source, water of a satisfactory and sanitary quality. Such illustrations serve to show the result of temporizing measures in matters relating to public health. It is a strange quality of the "public mind" that often nothing short of a great community misfortune will arouse it to demand civic reform.

LICENSING WATER PLANT OPERATORS

Water Purification and Sewage Treatment Plants Should be Operated by Licensed Attendants.

Most citizens do not fully appreciate the high degree of responsibility that rests on the operators of water purification plants. These operators have in their hands lives of the population served practically to the same degree as a locomotive driver, and more so than a boiler stoker. Why not have them also licensed? Pioneer legislation along these lines has been enacted by the state of New Jersey, the bill providing that hereafter all sewage treatment plants must be in charge of superintendents, or operators licensed by the state. On its introduction in the legislature, the bill was accompanied by a statement of its purpose which is well worth quoting: "The purpose of this bill is to secure the employment of attendants at water-purification and sewage-treatment plants having a higher degree of intelligence and more familiarity with the operation of these plants than is now the case. There are a large number of water-purification plants and sewage-disposal plants now in operation in this state. The experience of the State Department of Health has shown that many of these plants, particularly the smaller ones, are operated in a very unsatisfactory manner. This results, in the case of water-purification plants, in imperfect purification of the water at times and the consequent exposure of the people who use the water, to danger from water-borne disease. The unskilful and careless operators of these plants also result in their rapid deterioration, which ultimately entails upon the municipalities owning them the expenditure of funds for repairs and replacements which would not be necessary were the plants properly operated."

RECENT REGISTRATION

Bonneville and Allard is the name of a new plumbing firm in Montreal.

Dionne and Lestage have set up in the plumbing business at Coaticook, Que.

HOUSING IN WINNIPEG

A bulletin on the housing question in Winnipeg has been issued by Dr. A. J. Douglas, the city medical officer, states the "Free Press." As well as commenting on the Dominion Government's offer to loan money for building purposes to the various Provinces for 20 years at five per cent. interest, and suggesting that it stands in need of amplification, Dr. Douglas supplies a statement as to the actual housing situation that exists in the city.

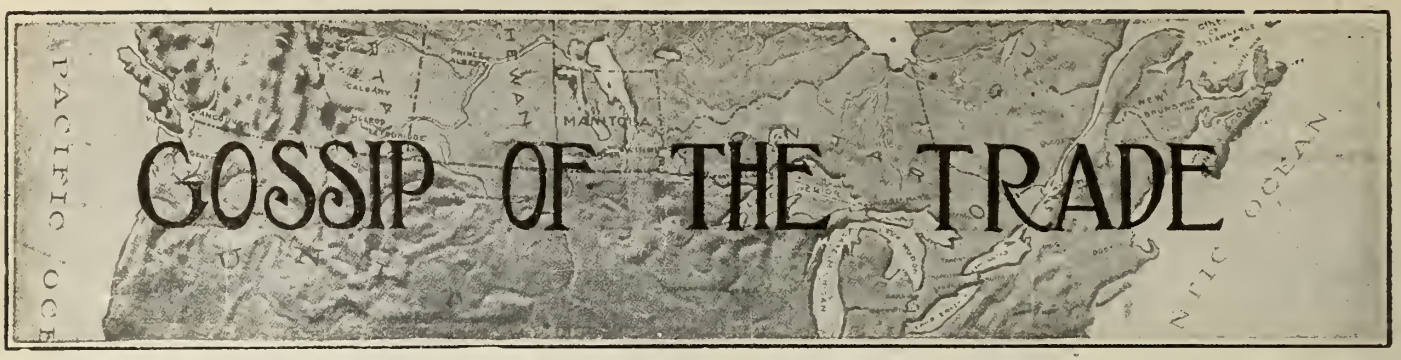
This statement shows that there is a marked tendency for the one-family dwelling house to become a sort of miniature apartment block. In a survey which embraced one-twelfth of the total dwellings in Winnipeg out of 2,097 one-family houses, no fewer than 361 were found to be occupied as tenements; and it is suggested that this proportion justifies the inference that at least 1,000 houses in the city are so occupied.

There are 1,480 vacant houses, and of these about 40 per cent. are stated to be unfit for habitation, and many so poorly built as to be uninhabitable in winter. Some are vacant on account of their location, and others because they are too large for use by single families. A tabular statement shows that while in 1913 there were built 2,051 dwellings and 64 apartment blocks, in the years 1915-16-17-18 there were built 171 dwellings and 11 apartment blocks. Since the war started there have been in the city over 10,000 marriages. "Where," Dr. Douglas asks, "are these newly married couples living?"

The question of housing in the city ought to be passed under review in order that future building operations may be governed by intelligence and discretion. Dr. Douglas touches on this feature of the subject, and cites the systems in operation in New Zealand and Australia, where loans are made to individuals for house building, and where applicants have a choice of 18 approved plans and specifications of houses suitable for the wants of moderate-sized family.

This is the type of house that is not nearly so common in Winnipeg as it should be, and should a deliberately concerted building programme be entered upon it might be possible to go a considerable distance on the way towards supplying the shortage. There are many houses cumbering good sites in the city which should be dismantled if, on examination, it is shown that they cannot be made habitable during the winter months without an undue expenditure of fuel. It is evidently the opinion of the city's health officer that the building regulations have not been ideal. "Unscrupulous builders," he says, "who jeopardize the health and comfort of the future occupants of the houses which they build, should be heavily fined."

The whole leaflet is of an instructive and interesting nature.



ROBT. McHENRY JOINS DUNHAM COMPANY

The C. A. Dunham Co., Ltd., announce that Robt. W. McHenry, recently engineer for J. T. Blyth of Ottawa, has been selected as engineer for their Ottawa office. He will be associated with J. H. Shaver, who is manager of the company's branch sales office at Ottawa. Mr. McHenry is well known to the heating trade through Ontario, who will wish him success in his new connection.

A. J. HAMMOND JOINS EMPIRE MFG. CO., LTD.

Mr. A. J. Hammond, of Winnipeg, has joined the staff of the Empire Mfg. Co., Limited, as representative from Fort William to the Pacific Coast.

Mr. Hammond served his apprenticeship in Toronto as a plumber and after working there for several years, he moved to the United States, where he worked for some time, again returning to Toronto. From Toronto he went to Winnipeg, where he worked for a short time and then he formed the partnership of Hammond & Rodway. Mr. Hammond took an active part in local and Dominion Plumbers' Associations and in 1906 was elected vice-president of the Plumbers' Association for the Dominion of Canada. He was the means of having the first convention held in the West, held in the city of Winnipeg, and at that time he was elected president of the Plumbers' Association for Canada. Mr. Hammond's experience in the plumbing and heating business will no doubt be of great benefit to him in his new duties.

IMPERIAL CITY HEATERS LTD. SUCCEED GOODWIN & CO.

The name of Goodwin & Co. Limited, Sarnia, Ont., has been changed to Imperial City Heaters, Limited, Sarnia, Ont. Change became effective on March 25, and the company is now operating under the new name.

FIRES

In a fire at Montreal, Samuel Shulman, plumber and hardware, sustained a loss of $1.000.

OBITUARY

David A. Gordon, ex-M.P., of East Kent, and prominent manufacturer of Wallaceburg, died at Braithwaite, La. He had been associated with the Wallaceburg Brass Works, Wallaceburg Cooperage Co., Sydenham Glass Works, Dominion Sugar Co., in addition to extensive other interests.

Charles Jackson, of Dixie, Toronto Township, who had the distinction of being the first apprentice plumber in Toronto, passed away on March 18th at the age of ninety-one.

Mr. Jackson, who was a Yorkshire man by birth, came to Toronto in 1850. He was apprenticed as a gasfitter and helped in the piping of St. James' Cathedral and the Normal School. A large family survives Mr. Jackson and his wife, who died seven years ago.

The death of George W. Cole occurred at his late residence, 64 Parkway Ave., Toronto, from heart failure. Mr. Cole was born in Norwich, Ont., and was in his fifty-ninth year He came to Toronto about seven years ago and organized the business known as George W. Cole, Limited, 2002 Dundas St. West, of which he was president and general manager at the time of his death. Private services were held at his late residence, after which the body was taken to Norwich. Mr. Cole leaves a widow, one daughter, Margaret M., and two sons, Brock L. and Grant E.

TRADE NOTES

Sanderson and Robertson, plumbers and steamfitters of Orangeville, have purchased G. A. Campbell's building on East Broadway and will move there next May.

The Department of Public Works, Ottawa, want tenders up to April 16, for the extension to power house and laundry, Military Hospital, Winnipeg.

John A. Pearson, architect, Ottawa, is calling for tenders up to April 12, for the refrigerating equipment needed in the Parliament Buildings at Ottawa.

D. H. Fleming, of St. Catharines, has been appointed town engineer of Owen Sound, and will take over his duties about the first of next month. He has been on the city engineer's staff at St. Catharines.

Tenders are being asked by J. Schofield, architect, Room 459, Union Station, Winnipeg, for the building of a new station for the Canadian National Railways at Moose Jaw. The tenders call for the supply of all labor and materials for the erection and completion of a station building.

C. T. McBride, secretary-treasurer of the Public School Board, St. Catharines, is calling for tenders for competitive plans for two single-storey schools of eight class rooms, with accommodation for manual training, domestic science and kindergarten for this city. Closing date is April 15.

Orr Bros., Vancouver, are sub-contractors for plumbing and heating for the big addition to the King Edward Sanitarium at Tranquille, B.C. The Dominion Construction Company, Ltd., Vancouver, have the contract for the erection of an infirmary and service station to cost $150,000. The work is to be completed by July 1.

A special advisory committee of the Board of Education, London, Ont., at a special session, concluded to recommend the immediate construction of a new $60.000 eight-roomed building for commercial classes at London Collegiate Institute. The work will be proceeded with without delay. Overcrowding necessitates the construction of the school, which will be located on the north side of the Collegiate campus. It was originally thought that such a school could be provided for $40,000.

PROVINCIAL ASSOCIATION ACTIVE IN SASKATCHEWAN

Next Meeting to be Held at Saskatoon on April 6-7-8.

The Provincial Association of Saskatchewan Sanitary and Heating Engineers, recently formed, is actively engaged in developing the work of the association. The next convention will be held at Saskatoon on April 6-7-8. Aside from matters directly connected with the forming of the Association, at the initial meeting, the subject which received most attention was that of "Sewage disposal for country homes." The officers of the Association are as follows:—

President, N. B. Roantree, Swift Current; Vice-president, E. P. Paulin, Regina; Sec.-Treas., James Adam, Regina. Executive: G. Walker, Weyburn, Sask.; J. Brandon, Saskatoon; D. D. Hoover, North Battleford; F. J. Alexander, Moose Jaw; D. B. Bryant, Regina.

Master Plumbers Throw the "Stanes"

With One Slight Hitch at the Eleventh Hour, Montreal Plumbers Throw the Rocks and Secure Handsome Trophies

WERE the plumbers of Montreal not so genial and charitable, they would no doubt have to their credit this year a large number of trophies from throwin' rocks. With a comparatively short season this year and with many demands from as many sources for the use of every sheet of ice on the Montreal rinks, it is, therefore, not surprising that the real match of the present winter should have been left until the eleventh hour.

Arrangements for the finals this year were left with Jim Griffin, and he carried these out well, almost to the point of perfection. There was just a slight hitch at the finish and the trusty weight throwers had, for a brief period, faced the unpleasant prospect of playing on without "one bit refreshment." It was on this wise: "Jim forgot to get the key to the big cupboard where the cheese and crackers repose for brief intervals and where the "juice" well-nigh spoils. It was looking dark indeed for the line-up, and their work on that Tuesday afternoon was the harder owing to soft and heavy ice. But to Mr. Griffin's lasting honor, the key was finally secured and refreshments to the king's taste were supplied in abundance.

The Rinks

The rinks playing off on March 11th were as follows:

J. Greenough	Thos. L. Bain
W. H. Munday	James Buchan
J. A. Gordon	John Watson
Dan Bethune (Skip)	James Griffin (Skip)
Score—12	—9
Dan Bethune	James Griffin
W. H. Munday	J. Greenough
Score—4	—1
Dan Bethune	W. H. Munday —1

As before stated, the ice was most difficult and the heaviness of both sheets prevented better work being done all around. It tried the muscles and developed great sweats which only the assuaging flood of pale ale was equal to counteracting. And, as for sweeping—it was lost motion. Once in a while the hog line was not reached, but that was no reflection upon the veteran whose shot it was, for man trained to expertness in throwin' a forty-pound weight is trained rather to skill in directing his stone, and it is a place where sheer strength does not enter as an important factor.

It was an appreciated moment when the cupboard lock responded to the turn of the key, and with a little "assistance" thus afforded the players went forward to do their best.

Prizes were donated by the Taylor-Forbes Co., Montreal, through the manager, Mr. Smallpiece. Mr. Bethune took the silver stein and Mr. Munday the silver cup thus donated, and on which other eager and almost covetous eyes were cast. Throughout the game real "Master Plumber Fellowship" prevailed and the afternoon was pleasant and profitable.

Notes of the Match.

If there was one regret, it was furnished through the absence of the late R. W. J. Hughes. Always an enthusiast and a keen player, and one who played the game for the delight there was in it, his presence was decidedly missed.

* * * *

It was a real pleasure to watch the countenance of Secretary John Watson as he viewed the progress of the game.

JAMES BALLANTYNE

Chosen by popular ballot as Mayor of Montreal West, and whose photo appeared in issue of March 15th. At that time the name of Mr. Ballantyne was omitted and another used, making this correction necessary.

Is it any wonder there was a keen competition, for after the first play Mr. Watson continued to lend his energetic support to the winners and the would-be winners?

* * * *

No one blamed Jim Griffin for the brief delay in "opening up." It was all the more appreciated when the cupboard doors swung open.

* * * *

President Telles Latourelle is a coming curler. His enthusiasm was well to the fore on the ice and a little toning down of his strong arm will put him in the winning class another year.

* * * *

James Ballantyne must have had difficulty in passing up this match. A prearranged trip to Atlantic City compelled his furnishing a substitute, but Mr. Greenough did good work in his absence.

* * * *

Secretary Watson says that new blood is expected next year from among new members. The French-Canadian members are beginning to take a real interest in the roarin' game.

* * * *

James Griffin contracted a cold during the game, but a couple of days under the quilts did the needful.

* * * *

There was nothing but the best of feeling between the ultimate winners of the silver. They will have a chance to swap next year.

On the Side

THE Hamilton "Times" claims "Yesterday a house was burned down because the fire wagons were bogged in one of the streets." But what has become of that fine brand of folks who used to climb the roof and pour salt down the blazing chimney?

* * * *

THE long lists of tax sales that are appearing in some of the Western papers are proof positive that the tax papers are wearing down the financial resistance of many an Easterner. It is one trick to get in on a good thing, and quite another to get out while the thing is still good.

* * * *

IF a League of Nations is going to come into existence, right now is the time. The reason is that there are problems that only the courage of a united civilization can meet. Once peace is signed the feeling of need for concerted action to regulate international affairs will begin to wane. Right now is the time for action.

* * * *

THE new prices that have been announced for United States steel and iron brought forth every diversity of opinion that could well be imagined. The schedule has been denounced, damned with faint praise and heralded as the forerunner of greater business activity. There is no doubt that the whole ruling has been a compromise between the two factions that were foremost in the negotiations.

INCORPORATIONS

Ontario Sewer Pipe and Clay Products, Limited, capital $300 000, head office Toronto, plans to manufacture and deal in sewer pipes, brick, tile and contractors' supplies.

The National Safety Oil Burner Company, Limited, head office Toronto, capital $40,000, plans to manufacture and deal in oil burners, oil filters, stoves and furnaces.

Subscribers Are Urged to Send in Questions to be Answered, or to Comment on Letters Published—Description of Jobs Done or Shop Kinks Are Also Invited.

Steel Shelving, Etc.

Question. — R. Chestnut & Sons, Fredericton, N.B. Please advise where we can buy pressed steel or sheet iron shop boxes and shelving for carrying a stock of pipes, fittings, etc.?

Answer.—Steel shelving, etc., may be purchased from the Dennis Wire & Iron Goods Company, London, Ont., and Geo. B. Meadows & Company, Toronto.—Ed.

The Blue Book

Question.—F. Scholey, 7 and 8 Hicks Block, Calgary, Alta. In your last issue of SANITARY ENGINEER, March 1, 1919, I notice an article entitled, "Cheapening Plumbing." In this article reference is made to a "Blue Book." Where could I get a copy of it?

Answer.—The Blue Book is an official Government report on conditions found to exist by the committee. It may be obtained on application to the secretary of the Ontario Housing Committee, Parliament Buildings, Toronto, Ont. The issue, however, is temporarily exhausted, but a new supply will be ready about April 15, 1919. There is no charge, and you will receive a copy on making request to the secretary.—Ed.

Wisconsin Apprenticeship Bulletin

Question.—H. Coates, 189 Lanford Ave., Hamilton, Ont. I have read with interest some articles in recent issues of the SANITARY ENGINEER on a bulletin issued in the United States, viz., "The Wisconsin Apprenticeship System," of March 15, and "Technical Education Necessary," of February 15. I am interested in technical education and would deem it a favor if you would tell me how to get the bulletin.

Answer.—The Wisconsin Apprenticeship Bulletin was issued by the Industrial Commission of Wisconsin at Madison, Wis., the state capital, early in the present year. You can secure a copy by writing to the foregoing address.—Ed.

McKINNON INDUSTRIES TO EXPAND

As soon as plans now being made by the McKinnon Industries of St. Catharines are completed, the firm will manufacture malleable iron castings, hardware, drop forgings, iron and steel frames, electric welded products and several automobile parts, including transmissions, radiators and steering gears.

UNITS OF ELECTRICAL MEASURE FOR CANADA

Bill No. 17 Passed by House of Commons

The Electrical Units Act was passed by the House of Commons on March 24 and the units of electrical measure for Canada shall be the following:

(*a*) As a unit of resistance, the international ohm, which is based upon the ohm equal to 109 units of resistance of the centimetre-gramme-second system of electro-magnetic units, and is represented by the resistance offered to an unvarying electric current by a column of mercury, at the temperature of melting ice 14.4521 grammes in mass, of a constant cross-sectional area and of the length of 106.300 centimetres arranged in accordance with the specification contained in Schedule A to this Act;

Ampere

(*b*) As a unit of current, the international ampere, which is one-tenth of the unit of current of the centimetre-gramme-second system of electro-magnetic units, and is represented by the unvarying current which, when passed through a solution of nitrate of silver in water, and in accordance with the specification contained in Schedule B to this Act, deposits silver at the rate of 0.00111800 of a gramme per second;

Volt

(*c*) As a unit of electro-motive-force, the international volt which is the electro-motive-force that steadily applied to a conductor whose resistance is one international ohm, will produce a current of one international ampere. The Weston Normal Cell may be used as a standard of electric pressure, and when set up in accordance with the specification contained in Schedule C, to this Act may be taken as having, at a temperature of 20°C., an electro-motive-force of 1.0183 volts.

3. Such standard apparatus as is necessary to produce the units of electrical measure described in this Act, shall be deposited in the Department of Trade and Commerce and shall form part of the system of standards of measure and weight established by the *Weights and Measures Act*.

4. The *Electrical Units Act*, chapter fifty-three of the Revised Statutes of Canada, 1906, is hereby repealed.

PRACTICAL SHEET METAL WORK

(Continued from page 22)

diagrams L M in the usual way, which gives the true length of the slant lines for top and bottom gussets.

It will be noted that points 1 to D and D to 9 and 9 to 1 form really another true elevation of the side. From the various points transfer the corresponding measurements to the triangular side in pattern which in practice is really developing circular, or curved stretchout lines of the gussets required. While this is really a one-piece pattern, it will be noted that there require to be two seams—one at the back of the pipe and one at C^1 B, at top of the pipe.

Continued in next issue.

EXPORT RESTRICTIONS NOW REMOVED

Advices have been received by G. T. Milne, Montreal, and F. W. Field, Toronto, British Trade Commissioners in Canada, that the following additions have been made to the list of goods which may be exported without license:

Lists of export restrictions recently removed:

Barrels and casks, boilers, fuel economizers for boilers, lead coated sheets, cast iron pipes, iron or steel wire, wire rope, cast iron radiators, railway sleepers (iron or steel), railway springs, railway wheels, axles and tyres, railway constructional material except rails, terne plates.

BANKRUPTCY ACT BEFORE THE HOUSE

THE Bill in respect to bankruptcy which the Government has introduced at Ottawa will supply something which has been lacking in the commercial laws of Canada, although opinions regarding it are divided. The Act seeks to establish a uniform system of law and procedure throughout Canada in respect to matters of bankruptcy and insolvency.

A bill was introduced last year, which was prepared by seven lawyers from different parts of Canada. The main change in this year's bill is that it applies to all incorporated companies except railroads, banks, trust companies and insurance companies. The provisions of this year's bill applies to all persons, firms and corporations. This is a change from last year's bill, which provided that corporations could go into bankruptcy voluntarily.

RAILWAY'S CASH PLAN MAY GO INTO DISCARD

While no official statement has as yet been made by the Canadian Railway War Board, it is unofficially stated that the proposal of the railways to demand cash from shippers after June 1 has died a natural death. Nominally, the proposition has been left over until June 1 so as to give shippers a chance to make the necessary arrangements with bond houses to furnish the bonds required. It is stated, however, that the present plan is to allow the proposal to be forgotten. Circular 97, which was to have become effective on March 1, roused such a storm of protest that the measure was laid over. Manufacturers declare that they will never agree to the demand of furnishing a bond. They do not mind settling their freight bills in cash, but they declare there is no logical reason why they should be asked by the Canadian Railway War Board, the railways or anybody else, to furnish a bond, as long as their credit is unquestioned.

RAPPED CANADIAN PATENT OFFICE

Montreal Speaker Said That It Imposed Nothing More Than a Tax on Brains.

A strong criticism of the Canadian Patent Office, and suggestions for remedying defects, were contained in a paper read by H. A. Budden, A.E.I.C., at the meeting of the Montreal branch of the Engineering Institute of Canada.

Up to the present, said Mr. Budden, nearly 4,000,000 patents had been issued in the world, Canada issuing 188,000, Great Britain issuing 515,000, and the United States issuing 1,292,000. Unlike Great Britain, the United States and France, Canada did not classify her patents, he said; neither did she print patent specifications, and the cost of a typewritten copy of a patent was exorbitant. Mr. Budden pointed out a number of instances where, he said, the patent office could improve its procedure so as to afford greater and clearer information to the public, thus making the record as useful and complete as possible.

The financial position of the Patent Office was curious, he said. For the year ended March 31, 1918, there was a balance of receipts over expenditure of $101,520, and, said he, it was an injustice from a public point of view that the patent office should make a large annual profit out of the fees paid by inventors. It was merged in the ordinary revenues of the country and was a veritable tax on brains. The strain of protecting and maintaining patents was proved by the frequency with which patents were dropped merely in order to save renewal fees. The Canadian Patent Office had in the past been a milch cow supplying the Government with a large amount of funds, he said. The Patent Office could be made a more useful institution than it was at present, it being now chiefly occupied in granting monopolies to others than Canadians. Last year only 973 patents out of 7,238 were granted to Canadians.

NEW SARNIA INDUSTRY

The H. H. Robertson Company of Canada, capitalized at $200,000, has purchased the plant of the Sarnia Metal Products Company at Sarnia, Ont., and plans to commence operations about May 1 on the manufacture of asbestos covered steel roofing and siding; also ventilators, gutter and down pipes, skylights and asphalt paint. The officers of the new concern are: President, H. H. Robertson, Pittsburgh; vice-president, Jas. Playfair; secretary, R. I. Towers; Treasurer, N. S. Gurd; managing director, C. McKenzie. The new managing director was formerly with the hardware firm of McKenzie, Milne & Co., Limited, of Sarnia.

R. A. SHAW

Port Arthur, Ont., ready for action. R. A. says he can carry 300 lbs. in box of side-car, and cost of upkeep is less than shoe leather.. He has used this form of transportation for the past four years.

BIG INCREASE IN TORONTO PERMITS

The statistics at the Toronto City Hall tell an interesting story. During the first two months of 1918 there were only sixteen permits taken out in the City Architect's office for building of dwellings in the city of Toronto—three for solid brick and thirteen for cheaper houses, the total cost of these houses being estimated at $37,200. Notice the percentage of better class houses compared with the poorer type. This would indicate that the building was not done by the so-called moneyed class, as the houses were of the laboring man's type. Compare the above figures with the following:

Hundred and Ninety-Two in "Nineteen"

From the same source comes the information that the statistics for the first two months of 1919 show that there were permits taken out with an estimated total cost of $901,560; of this amount $391,750 was for solid brick dwellings, $35,500 for brick and roughcast, and $5,100 for frame, representing a total of one hundred and ninety-two houses compared with sixteen in 1918, an increase of 1,100 per cent. in number of houses, or 1,068 per cent. in dollars and cents. And there is every indication that the bulk of these permits will be acted upon within the time limit of six months. Few builders would go to the expense of having plans prepared and permits taken out unless they anticipated taking action, especially when there is a great shortage of houses.

Evidence that the building permits are being used is in the fact that hardwaremen specializing in builders' supplies claim an increase of business in this department of from 25 to 33 per cent. over last year for the same period—January and February.

FAMILY WIPED OUT BY ESCAPING GAS

Mrs. Eva Hogarth and her four children, Frederick, aged 9 months, Helen, aged 5, Archie aged 4, and William aged 3, the entire family of Mr. F. J. Hogarth, plumber, of 43 Rainsford Road, East Toronto, were wiped out by gas poisoning on March 18.

The children are supposed to have been playing house in the kitchen of their home, and when Mrs. Hogarth left the room, to have turned on all four burners of the gas stove. On Mrs. Hogarth's return, finding her children lying on the floor and the room full of gas, she is supposed to have been overcome. She evidently made some effort to reach the baby, Frederick, for she was found near the sink holding him in her arms.

TORCH EXPLODED

William Richardson, tinsmith, Dutton, Ont., was terribly burned when a gasoline torch he was using exploded and ignited his clothing. The accident occurred, it is stated, while he was adjusting the valve and some of the gasoline leaked out. His condition is reported as serious.

Health Act Before House

New Department Will Have Charge of Child Welfare Work—Inspection of Public Buildings With Regard to Sanitation

A great deal of comment has been raised by brief despatches from Ottawa in the daily press that Hon. Wesley Rowell had introduced a bill into Dominion House creating a new Department of Health. Very little definitely, however, was known, and the trade was able to get very little information. The bill received its first reading on March 26th, and if it passes will have a great affect on the trade. In view of this fact, SANITARY ENGINEER is glad to be able to produce it in its entirety.

BILL 37

An Act respecting the Department of Health:

1. This Act may be cited as The Department of Health Act.

2. There shall be a Department of the Government of Canada which shall be called "The Department of Health," over which a Minister of the Crown to be named by the Governor in Council shall preside.

3. (1) The Governor in Council may appoint an officer, who shall be called "the Deputy Minister of Health," who shall be the deputy head of the Department and who shall hold office during pleasure.

(2) Such other officers, clerks and employees as are necessary for the proper conduct of the business of the Department may be appointed in accordance with the provisions of the The Civil Service Act, 1918, and of any Acts in amendment thereof, all of whom shall hold office during pleasure.

(3) The Governor in Council may, subject to the provisions of The Civil Service Act, 1918, or any amendment thereto, transfer to the Department of Health any officer, clerk or employee now in the employ of His Majesty or of either or both Houses of Parliament, and subsection two of section seventeen of the said Act shall not apply to such transfers, and the money voted by Parliament for the financial year ending the thirty-first day of March, one thousand nine hundred and twenty, applicable to the payment of the salary or the increase of salary of any such officer, clerk or employee so transferred shall be available for the payment of his salary or increase of salary or the salary of any person appointed in his place in case of his death, retirement or dismissal while serving in the Department of Health, in the same manner and to the same extent as if such officer, clerk or employee had not been so transferred.

4. The duties and powers of the Minister administering the Department of Health shall extend to and include all matters and questions relating to the promotion or preservation of the health and social welfare of the people of Canada over which the Parliament of Canada has jurisdiction; and, without restricting the generality of the foregoing, particularly the following matters and subjects:—

(a) Co-operation with the provincial, territorial, and other health authorities with a view to the co-ordination of the efforts proposed or made for preserving and improving the public health;

(b) The conservation of child life and child welfare;

(c) The inspection and medical care of immigrants and seamen, and the administration of Marine Hospitals;

(d) The supervision, as regards the public health, of railways, boats, ships and all methods of transportation;

(e) The supervision of Federal public buildings and offices with regard to the health of Civil Servants and other Government employees therein;

(f) The enforcement of any rules or regulations made by the International Joint Commission, promulgated pursuant to the treaty between the United States and America and His Majesty relating to boundary waters and questions arising between the United States of America and Canada, so far as the same relate to public health;

(g) The administration of the statutes mentioned in the Schedule to this Act, and of Acts amending the same, and also of all orders and regulations passed or made under any of the said Acts; and all the duties and powers of any Minister of the Crown under either of the said Acts or any of the said orders or regulations, are hereby transferred to and conferred upon the Minister of Health;

(h) The collection, publication and distribution of information to promote good health and improved sanitation;

(i) Such other matters as may be referred to the Minister by the Governor in Council.

5. The Governor in Council shall have power to make such regulations as may be necessary to give effect to and carry out the objects of this Act, and to impose penalties for any violation of such regulations.

6. There shall be a Dominion Council of Health consisting of the Deputy Minister of Health, who shall be chairman, the chief executive officer of the Provincial Department or Board of Health of each province, and such other persons, not to exceed three in number, as may be appointed by the Governor in Council, who shall hold office for three years. The Dominion Council shall meet at such times and places as the Minister may direct, and shall be charged with such duties and powers as the Governor in Council may prescribe.

7. The Minister shall annually lay before Parliament, within fifteen days after the meeting thereof, a report and statement of the transactions and affairs of the Department during the year then next preceding.

VENTILATING THE MODERN SCHOOL

Continued from page 12

into the construction of the building. In other cases old buildings were remodelled and the system had to be fitted in under the very worst conditions. In several of the schools described the writer only had charge of the designing of the heating and ventilating systems. Many of these buildings are situated in the coldest cities on the American continent. So the reader can be quite satisfied that any recommendations made here have stood the test of experience.

About fifteen years ago the school boards in Western Canada became interested in placing more up-to-the-minute ventilating systems in their buildings than they had previously installed.

Before that time it had been our custom to instal warm-air systems of heating and ventilating in our schools. Those systems were, as a rule, installed so as to work on the principle of the indirect extraction of the foul air, and when we came to the matter of designing a steam heating and ventilating system for a school we had an awful time breaking some men away from their preconceived idea of the lay-out of ventilating stacks.

In the old-time warm-air systems, large tubular furnaces were set up in the basement and enclosed in brick chambers, these chambers connecting their bases with the outer air by means of a fresh air passage at the rear of the furnaces. The cold air came into the heated chambers by way of the fresh air passage and was heated by passing over the tubular furnaces. The tops of the heater chambers connected to flues leading to the class rooms. These flues were usually made of brick and ranged from 5 to 6 feet in area. Each class room had a fresh air flue and as a rule discharged its warm fresh air into the class room at a point near the ceiling.

We had to provide some means of escape for the foul air in the class room, so we provided another flue for each class roof and that flue opened into the class room at the floor line. The other end of the flue would be connected to a "gathering chamber." Here all of the foul air flues exhausted the foul air from the classrooms into a large stack. For every four classrooms we have a main ventilating stack running clear from the basement to above the roof, and that stack was generally about four to five feet square inside measurement. It was hard to convince some people that all of this indirect way of extracting foul air when we changed over to the steam system was unnecessary, so we went ahead for a long time installing indirect "school pin" radiators in the old style heater chambers, and heating the air for ventilation. We also provided direct radiators in each class room and in the corridors. After a time we managed to get the big stack eliminated from our designs and then we continued our smaller vent flues through the roof instead of running them to the basements. We then found that the flues we had used for the indirect extraction of foul air were too large for direct extraction as the air rushed out through these flues at too high a velocity, so we began to cut down the area of the fresh and foul air flues until we found what was the best size for certain conditions. We made our flues large enough so that we could get a certain measure of ventilation on muggy days, and by means of throttling dampers reduce the area of these flues when necessary on the clear, cold, wintry days when the air would be rushing through them at a speed of 500 feet a minute instead of the 200 feet figured for the muggy day.

This was all for gravity systems of ventilation. When the blast and exhaust fans come into use in our public schools it simplified our work, as we were then able to figure for one condition that we could be reasonably sure of controlling, and that was the quantity of air that the fans would handle under a fixed speed at the pressure conditions surrounding the installations.

To-day there are many excellent books on this subject, but the writer believes that what the average engineer requires is a knowledge of about what size ducts are used in general school work together with the proportion of radiating surface and the boiler power required per sq. ft. of indirect surface.

In some of the articles following this we will show drawings of the various types of systems, and in closing this will state: That the average modern classroom of 32 ft. x 25 ft. x 13 ft. requires from 200 to 250 sq. ft. of radiation for heating. It requires from 80 sq. ft. to 90 sq. ft. of indirect radiation to heat 30 cubic feet of air for each of its 45 pupils. Each fresh air flue area should be nearly 2 sq. ft. The above is for fan ventilation. For gravity ventilation there should be 150 sq. ft. of indirect radiator supplied with a fresh air flue area of 6 sq. ft.

Indirect radiation as installed for ventilating work is equivalent in direct radiation approximately as follows: With the fan blowing cold air against the radiator 5½ times, thus 90 sq. ft. of indirect equals 490 sq. ft. direct. In a heater chamber with cold air passing through by gravity, 3 times, thus 150 sq. ft. indirect equals 450 sq. ft. direct.

The above figures are not exact to a foot but they are close to the general practice.

(To be continued in next issue)

C. S. D. S. & H. EXECUTIVE IS BUSY

In order that there may be prompt and efficient consideration of any requests, and that the programme may be whipped into shape at as early a date as possible, the executive of the Domestic Sanitary and Heating Engineers is holding weekly meetings in Montreal. Send in your correspondence to Secretary John Watson, 4145 St. Catherine St. West, Montreal, pointing out the problems you have met and making any constructive suggestions. They will be welcomed and Secretary Watson is closely in touch with many matters, having had a long period of service with the Society. He will be the happier if all outside associations will communicate with him and outline their intentions and wishes regarding the big convention.

Remember the dates—June 3rd and 4th and PLAN TO COME.

GAS OF LESS POISONOUS CHARACTER

Following the death of five persons in one family from illuminating gas, a letter appeared in the Toronto "Star" from Robert W. King, of 10 Walmer Rd., Toronto, dealing with "gas poisoning." The letter follows:

"In 1911, as a result of investigation Mr. King found that the increasing number of deaths from gas poisoning at that time were due to the increased use of water gas along with coal gas. Later Mr. King visited a number of American cities on a tour of discovery and found that a number of these cities had passed a by-law prohibiting the use of water unless some chemical was used with it that gave it a very strong and disagreeable smell. He goes on to say:

"My attention to the recent large number of cases due to gas poisoning has been more particularly aroused by the account in the morning's papers of the sad case of five suffocated by gas and the presentiment that had the gas been of a less poisonous character all these lives might have been saved.

"I am making no assertions or charges of any kind as to what our Consumers' Gas Company is doing, but simply suggest that an investigation would be in order. Is it possible that the safety of our citizens is being jeopardized through carelessness—or greed in desire to pay the highest dividends possible on too highly favored or watered stock?

"It appears to me that such an investigation would be quite in order with the spirit of the age, since the war."

No doubt many readers of the SANITARY ENGINEER have views on this subject, and we would like to have expressions of opinion from our readers. —ED.

CATALOGUE AND BOOKLET DEPARTMENT

Galvanized Sheets Bundling Table

The Dominion Shhet Metal Corporation Limited, Hamilton, Ont., has issued an attractive galvanized sheets bundling table measuring 10½ by 14 in. This table gives practical and interesting as well as valuable information regarding the weight per square foot in ounces and in pounds, also square feet per sheet, weight per feet, number of sheets, weight of bundles. Copies will be supplied free to the trade upon request.

Housing Schemes

The Leeds Fire Clay Company Limited ,of Wortley, England, issued a 16-page booklet, entitled "Housing Schemes," in five chapters, on the following subjects: baths, sinks and closets, fire places and smoke prevention, various materials and fittings. Copies of the booklet will be supplied upon request.

SANITARY CONDITIONS AT KITCHENER SCHOOL BAD

Insanitary conditions at Kitchener School, North Toronto, are still the subject of lively debate among the trustees and the residents of that district. Letters have passed back and forth from the county and city school boards from the city and provincial boards of health, engineers and others.

"We visited the school, and it is horrible," declared Trustee Douglas. The pupils are using surface water and outdoor closets. There is no drainage because neither the city nor the county will pay the $1,200 or $1,500 to lay the sewer some 300 feet from the city limits to the school."

Kitchener School is just beyond the city limits of Toronto and this squabble has gone on ever since the school was built two years ago.

DROP IN CAST IRON PIPE PRICES

An important drop in cast iron pipe and pipe fitting prices occurred last week when two Toronto firms, the Anthes Foundry Co. and The Toronto Hardware Co., announced some very important revisions of their price list, giving as much as 35 per cent. off the price of 2 to 6 inch cast iron fittings. The complete list of these changes follows:

Cast Iron Pipe

4 inch medium and heavy	25% off
2, 3, 5, and 6 inch med. and heavy	20% off
8 inch	15% off

Cast Iron Pipe Fittings

2 to 6 inch	35% off
8 inch	15% off

Market Conditions and Tendencies

Statements Regarding Supplies and Trend of Prices

THE MARKETS AT A GLANCE

A NUMBER of price revisions, all with a downward tendency, have taken place, and a number of others are in process. This uncertainty regarding prices is reflecting itself in business, which in many lines is reported as quiet. There is a feeling, however, in the trade that with the revision of prices to lower levels business will steadily improve. There is no doubt about the amount of business to be had, it is stated, but many are holding off hoping to take advantage of the lower prices. A great many inquiries are being received. Some firms state that up to the present time this spring they have had more inquiries than they had in the past three years. The outlook for business is bright.

The new prices put into effect in the United States for iron and steel are reflected in the markets here, as Canadian firms are meeting them all along the line.

An important revision has been made in the prices of soil pipe and fittings. The new prices, it is stated, are likely to hold for some time.

Solder prices are a little easier. While lead has shown no change there are indications that it may advance before long.

Prices of tin are expected to be a little lower shortly.

Copper stocks are very large, and only a fair amount of business is offering at from eighteen to twenty cents.

A steady volume of most satisfactory business in fittings and supplies for firms who have shipbuilding contracts is coming in. This activity is general from coast to coast. No changes in prices have been made and none is looked for immediately.

TORONTO, Mar. 27.—Prices of galvanized sheets have again been revised slightly. Business in ingot metals is quiet, copper showing tendency to sag and tin indications of an advance. An important revision in the prices of soil pipe fittings has been made. New prices are out also for flat rim sinks. Solder is a little lower.

No Changes Shown In Range Boilers

RANGE BOILERS—The new prices for range boilers which were outlined in the last issue of SANITARY ENGINEER are still holding. Business in these lines is fair with every prospect of steady improvement as many inquiries are being received which may reasonably be expected to develop into orders before long. Prices are as follows for standard boilers:

12 gal, and under, $9.50; 20 gal. and under, $10.50; under 30 gal., $11.50; 30 gal., $12.25; 35 gal., $15.00; 40 gal., $18.00; 52 gal., $24.00; 66 gal., $33.00; 82 gal., $40.00; 101 gal., $50,00; 120 gal., $65.00; extra heavy boilers quoted for the 30 gal., $14.50; 35 gal., $17.00; 40 gal., $20.00; 52 gal., $28.00; 66 gal., $38.00; 82 gal., $47.00; 100 gal., $58.00; 120 gal., $75.00; 144 gal., $90.00; 168 gal., $100.00; 192 gal., $110.00.

Range Boilers	Standard	Extra Heavy
30-gallon	$12 25	$14 50
35-gallon	15 00	17 00
40-gallon	18 00	20 00
52-gallon	24 00	28 00
66-gallon	33 00	38 00
82-gallon	40 00	47 00
100-gallon	50 00	58 00

Prices Unchanged For Heating Coils

HEATING COILS — No change has been made in heating coils and the following are the quotations:

30 gal. and under, $12.00; 35 gal., $14.00; 40 gal., $16.00; 52 gal., $20.00; 66 gal., $25.00; 82 gal., $28.00; 100 gal., $31.00; 120 gal., $35.00; 144 gal., $40.00; 168 gal., $45.00; 192 gal., $50.00.

New Prices For Flat Rim Sinks

ENAMELWARE—Business prospects in this line are steadily improving as the building programme that is being worked out all over the Dominion gradually develops. Numerous inquiries are coming in and some big contracts will be figured on shortly. Quotations are as follows:—

Bath-tubs, roll rim, 4, 4½, 5 feet, 24 to 30 in. wide		$32 10
Bath-tubs, 5½ ft.		35 70
Basins, flat back, 14 x 15 in.		6 00
Do., corner, 15 in.		5 95
Sinks, roll rim, 18 x 30 in.		15 05
Sinks, flat rim, 20 x 30	6 47	6 35
Do., 18 x 30	5 62	5 50
Do., 18 x 24	5 12	5 00
Do., 16 x 24	4 92	4 80
Do., 14 x 20	4 25	....
Closets, oak tank and seat		27 00
Do., enamel iron or white vitro tank		29 00

Soil Pipe, Fittings Revised Downward

SOIL PIPE, FITTINGS.—The lower price levels predicted in the last issue of SANITARY ENGINEER are now in effect. Business is reported as fair with every prospect for immediate and steady improvement. The new quotations are:

SOIL PIPE AND FITTINGS

Medium and extra heavy soil pipe, 2 in. to 6 in.	20%
Medium and extra heavy soil pipe, 4 in.	25%
Medium and extra heavy fittings, 2 in. to 6 in.	35%
8 in. soil pipe and fittings	15%

C. I. PIPE FITTINGS

Cast iron fittings	12½%
Plugs	22%
Bushings	28%
Unions, standard	35%
Dart unions, ¼-inch to 2-inch	20%
Do., 2½-inch and larger	12%
Nipples, up to 4-inch	45%
Do., 4½-inch and larger	40%
Do., running thread 4-in. and under	25%
Couplings, 4-in. and under	35%
Do., 4½ in. and larger	15%

MALLEABLE FITTINGS

MUELLER

Compression Sink Bibbs

SIMPLE elegance, combined with superior strength and wearing quality. is what you give your customer when you install **MUELLER** goods.

The many advantageous features of **MUELLER** compression bibbs give maximum service from the bibb as a whole. The anti-spreading device that breaks up the whirling motion of the water and the corrugated stem and handle, allowing the handle to be set at any angle without becoming loose or wobbly, are only two of these features.

MUELLER Bibbs are the best the market affords. Write for prices.

Wrought Pipe Prices Will Be Revised

WROUGHT PIPE—Prices of wrought pipe so far have been unchanged, but word is expected at any time that slightly lower quotations are in effect. This is a natural development of the changes made in iron and steel as a result of the reductions now in effect in the United States. The present quotations are:

WROUGHT PIPE

Cotton Waste and Oakum Prices Steady

WASTE, OAKUM—Business in these lines is reported as only fair. Prices are unchanged and are as follows for waste:

Fancy, 15½c per lb.; Lion, 14c; Standard, 12½c; Popular, 11c; Keen, 9½c. Cotton waste is now pretty well down to lower price levels, quotations being revised a couple of weeks ago on some lines. New prices on some of the other numbers, which are also lower, are shown herewith: White, XXX, 19c per pound; XX, 18c; X, 16½c; XC, 15c; Japanese, 14c; colored, No. 5, 15c per pound; No. 1, 13½c; No. 7, 12c; No. 1A, 10¾c; No. 1B, 9½c.

Oakum is unchanged and general business conditions are reported fair.

	Per 100 lbs.
Best American	$21 00-$22 00
Clipper, spun	....- 21 00
Do., unspun	....- 10 50
Plumbers', spun	10 00- 10 50

No Changes Shown In Boiler Tubes

BOILER TUBES—A fair volume of business is reported in tubes. Prospects are for an improvement as a number of inquiries are being received. Quotations are as follows:

BOILER TUBES—	Per 100 feet Seamless	Lapweld
1 inch	$28 00	$.....
1¼ inch	32 00	.....
1½ inch	35 00	28 00
1¾ inch	35 00	28 00
2 inch	40 00	28 00
2¼ inch	43 00	30 00
2½ inch	45 00	35 00
3 inch	52 00	40 00
3¼ inch	.....	47 00
3½ inch	62 00	48 00
4 inch	70 00	60 00

Black Sheets Firm; Galvanized Lower

SHEETS, PLATES—There is a decidedly firmer tendency in the prices of black sheets and slight increases are noted this week in a number of lines. The quotations are as follows:—

BLACK SHEETS—	Per 100 lbs.	
10 gauge	$6 30	$7 50
12 gauge	5 55	6 05
14 gauge	5 60	6 10
16 gauge	5 70	6 20
18-20 gauge	....	6 30
22-24 gauge	....	6 35
26 gauge	....	6 40
28 gauge	....	6 50
3-16 inch plate	....	5 75
¼-inch boiler plate	....	5 50

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

GALVANIZED SHEETS—		
10¾ oz.	$8 10	$8 50
U.S. 28	7 70	8 20
U.S. 26	7 40	7 90

18 and 20	7 10	7 60
16	6 95	7 45
14	....	6 80

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

Lead Products and Solder Little Easier

LEAD AND ZINC PRODUCTS — A steady improvement in business is reported with prices showing a slightly easier tendency. Solder is down to 30 cents and lead sheets have been revised slightly. Quotations are as follows:

Lead pipe lb.	....	$0 12
Lead waste pipe, lb.	....	0 13
Lead traps and bends	....	Net list
Lead wool, lb.	....	0 14
Lead sheets, 4 to 6 lbs., sq. ft., in rolls, lb.		0 10¼ 0 10½

Cut sheets ½ to ¾c lb. extra and cut sheets to size, 1c lb. extra.

Solder, guaranteed, lb.	$0 35	0 37
Solder, strictly, lb.	0 33	0 37
Solder, commercial, lb.	0 30	0 36
Solder, wiping, lb.	0 29½	0 42½
Solder, wire, lb.	0 40	0 45½
Zinc sheets, per lb.	....	0 20

No Price Changes For Old Materials

OLD MATERIALS—Business remains very quiet in these lines, although there are hopes that the lower prices for iron and steel may start something before very long in the way of a general improvement that will help the scrap market. The quotations are:

Dealers' Buying Prices—		
Tea lead	....	0 03
Heavy lead pipe	....	0 04
Pipe scrap	....	8 00
Stove plate, per ton	....	10 00
No. 2 busheling	....	8 00
Yellow brass	....	0 06
Red brass	....	0 08½
Light brass	....	0 05
Scrap zinc	....	0 05
Heavy copper	....	0 15
Wrought iron, No. 1, per gr. ton	....	15 00
No. 1 machinery cast	....	14 00
Heavy melting steel	....	9 00

Lead is Easier; Tin Prices Firm

INGOT METALS—Copper stocks are reported very large all over the country and with only a fair volume of business offering the tendency is for prices to be a little easier. The range of quotations runs from 18 to 20 cents a pound. Lead is now selling at from 7 to 7½ cents a pound with a fair demand and prospects for an advance. Tin prices are uncertain, but it is stated that the tendency will be toward lower prices.

COPPER—Future prices will be governed to some extent by overseas business, and as little has developed in copper so far there are very large stocks on hand. There are indications however that the domestic demands may increase materially before long. In the meantime prices show little change.

TIN—Tin prices are expected to be slightly lower, but no reduction has as yet been made. There has been a fair demand at the ruling price of 60c a pound.

LEAD—The market is firm and there is a tendency toward higher prices. An increasing demand is apparent and many inquiries are coming in. Prices rule from 7 to 7½c.

ALUMINUM—The volume of business is reported as only fair. Quotations are being made at 50c or thereabouts, depending on quantities.

ANTIMONY—Business is quiet in this line with prices holding steady at 8¼ to 8½ cents, and no indications of a change.

"VALVENE" Discs (REGISTERED)

A DRY CELLAR!

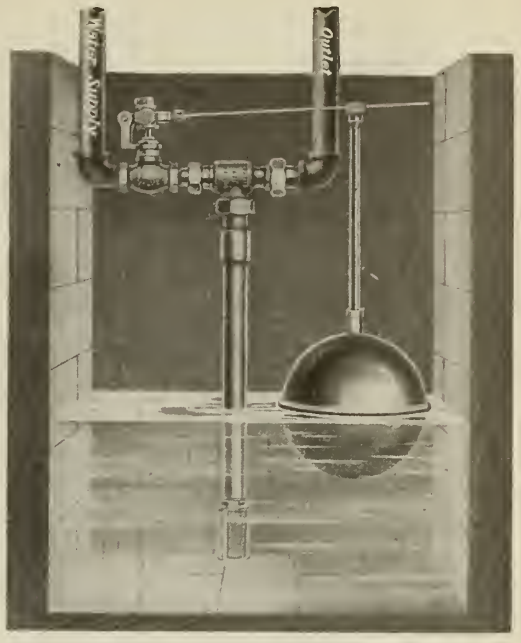
It's not necessary to have that basement of yours flooded every Spring. Why stand idly by and watch your stock being needlessly damaged and rapidly deteriorating in value?

Install a **Morrison Automatic Cellar Drainer.**

It will keep your cellar dry all the year round. It's easily installed, entirely automatic, all working parts are above water, operates at 10 lbs. water pressure and has no complicated cams or levers to get out of order.

Whether for your own use or to sell to your customers it will pay you to investigate the satisfactory, sure and perfect working qualities of the **Morrison Cellar Drainer.**

Dealers are making splendid profits selling them. May we send you complete information?



The James Morrison Brass Mfg. Co., Ltd.
93-97 Adelaide St. W., Toronto, Ont.

Now is the best time to install a Septic Tank.

Use Anthes Syphons and Soil pipe for they have no superior for permanence, quality and price.

We wish to announce also new and very full lines of

LIGHT SOIL PIPE AND FITTINGS

Prices for which will be furnished on request.

AND

FLAT HUB MEDIUM PIPE AND FITTINGS

Which are the same price as the ordinary medium pipe and fittings

Ask your jobber for "Anthes" Syphons, soil pipe and fittings.

ANTHES FOUNDRY, LIMITED

TORONTO and WINNIPEG

The most progressive and successful men in the Sanitary Engineering, Plumbing and Heating trades are regular readers of the "SANITARY ENGINEER."

That is why advertisers get results.

SALE OF

SURPLUS MILITARY AND NAVAL STORES

DRY GOODS, CAMP SUPPLIES, FOOD, HARDWARE, SCRAP METAL, JUNK

Cloth; new and second-hand clothing, equipment, hardware, tents, blankets, camp supplies, etc. :: Flour, jam, canned evaporated milk, tea, coffee, etc. :: Condemned clothing, junk, old brass, metals, leather, rubber, etc.

All communications should be addressed to the Secretary, War Purchasing Commission, Booth Building, Ottawa, who will be glad to supply lists and further details to those interested.

PIPE AND THE PUBLIC WELFARE

By R. C. McWANE

A Book Just Off the Press

Every sanitary engineer should be the possessor of this book. It deals with pipe-making of all kinds, cast iron, wrought iron, steel, wood and tile pipe. It is valuable because it gives the users of pipe a true idea of how pipe lasts under various conditions when in service.

A Veritable Encyclopedia of Motor Truck Facts, Figures, Methods and Systems

Here is a book that considers practically every phase of successful motor truck operation. It was written by S. V. Norton of the B. F. Goodrich Company, after a country-wide investigation into the possibilities of the motor truck.

It describes the many ways in which the motor truck is being used to win business, give better service and build profits. It gives a description of practical, low-cost delivery systems—tells how to lengthen the life of the motor truck—what to look out for—how to map out a complete routing system—how to figure upkeep costs—how to keep your truck going at minimum expense—in short, here is a book that will tell you anything you want to know about successful motor truck operation, that will enable you to get 100 per cent. service from its use.

Almost every method described in The Motor Truck as an Aid to Business Profits is accompanied by an illustration, a chart or a diagram. You read the description, then with a glance at the illustration you see instantly how it works and how you can apply it. If you are a motor truck owner this book will save and make money for you. If you are a prospective user it will tell you "Yes" or "No"—whether the purchase of a truck is a good investment.

A Small Investment But Big Returns

A single suggestion from the pages of this book may add five years of life to your truck. One new idea may result in hundreds of dollars saved. A system of routing, a plan for keeping cost records, for winning the co-operation of drivers—any one of these may result in increased profits that before would be impossible. Yet the price of this work is only $8.50. If it does no more than prevent a minor mishap, this much at least has been saved. But it will do far more than this—actually place in your hands the plans, methods, systems and ideas of thousands of successful motor truck users. You profit from their experience—you avoid the mistakes they made—you learn where and how they saved money, cut expenses and increased earnings. 530 pages—228 photographs—4 inserts—112 sketches—forms, diagrams, charts, tables and blue-prints—all yours for cutting delivery costs and increasing your profits.

Part I—Fitting the Motor Truck Into Your Business
Chapter I—The Field of the Motor Truck in Modern Business
Chapter II—When to Change From Horse to Motor Delivery
Chapter III—Comparing Cost of Horse and Truck Delivery
Chapter IV—How to Determine Cost of Performance

CANADIAN CONSOLIDATED RUBBER CO. LIMITED
DOMINION RUBBER SYSTEM
AND ASSOCIATED COMPANIES

The Dominion Rubber System is the oldest and largest organization in Canada manufacturing and distributing rubber goods of every kind. Every mechanical need has been included and a specialty is made of Washers, Tank Flush Balls, Bibb Washers, Fuller Balls, and the rubber sundries required by Plumbing, Sanitary and Heating Engineers. Complete stocks at our branches make prompt deliveries possible.

Quality is a cardinal factor in all our rubber sundries for the Plumbing trade. That is why the Dominion Rubber System products are sold and used by the largest jobbers and dealers throughout Canada. No inferior materials are used, and our skilled workers thoroughly understand every detail of manufacture. As a result, Dominion Rubber System products ensure genuine satisfaction.

Write the nearest Dominion Rubber System branch for price list, etc.

Quaturn Basin Cocks

Tell us to send you just one pair of these.
Then fit them up on a Lavatory Basin.
Show them to your customers and explain
—the sensible interior construction,
—how they close with the pressure,
—wear all on renewable parts,
—heavily nickelled finish,
—graceful design.
Then—orders.

Your first pair is ready.

The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH

Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with wood handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

Nut with Nut-Guards

This is a "Q" Foot Valve

And it Just *CAN'T* Leak

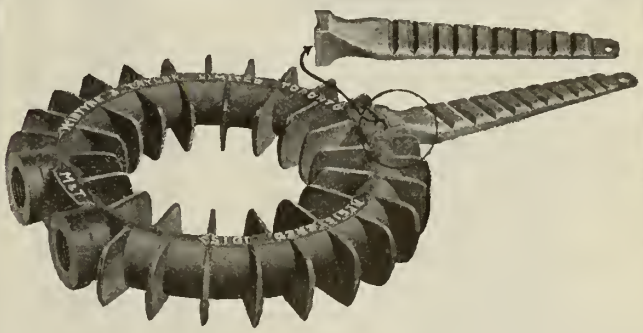
There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

R. MACDOUGALL CO., LTD.
GALT., CANADA



MORE HEAT!

This is our No. 15 Boiler Coil. Extreme dia. 13". Has a large heating surface allowing for a maximum efficiency. Very easily installed and lasts an unusual length of time.

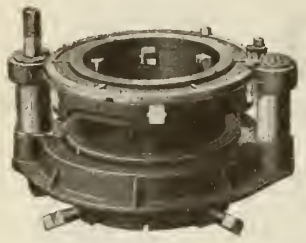
McIntyre & Taylor Limited

Toronto Montreal Winnipeg

A GOOD HUSKY BOY

will thread 2½ to 4-inch pipe easily

Make Hard Work Easy and Save Time



Beaver No. 41 Threads 2½, 3, 3½ and 4-inch Pipe Without Changing Dies.

One set of dies will thread all sizes, from 2½ to 4 inches, and is adjustable to cut standard, oversize, or undersize, insuring tight-fitting joints regardless of any variation in fittings.

Just take a look at the construction of Beaver No. 41. The threaded barrel or leader screw is a separate casting from the head to minimize repair expense; gears are protected; driving pinion is supported at both ends; bronze bushings and steel castings insure longer life. Only one set of dies to buy and these may be re-ground on a grindstone.

Works: LACHINE, QUE.

WROUGHT PIPE

BLACK and GALVANIZED SIZES, 1/8 IN. TO 4 IN.

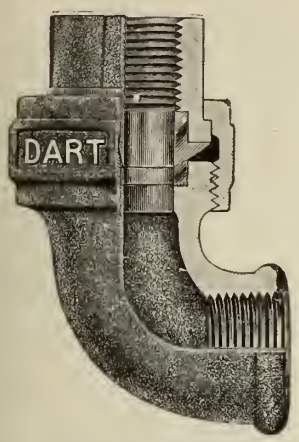
All our pipe thoroughly inspected, tested to 600 lbs. hydraulic pressure and branded.

All Sizes of NIPPLES (Black and Galvanized)

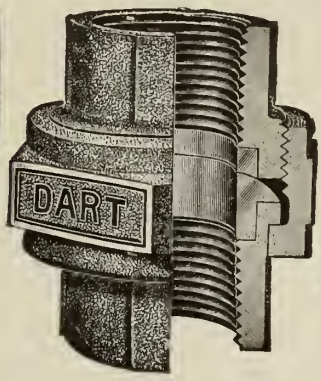
Ask your jobber for CT *Brand of Wrought Pipe*

CANADIAN TUBE & IRON CO., LIMITED, MONTREAL
Works: Lachine, Can.

DART Union Pipe Couplings



Cut above shows the Dart Union Elbow. By its use you save two threads, do neater work and make sure that the connection is trouble-proof.



BRONZE
Face and Seat

Easy to Use *Never Loosen Up*

It is surprisingly easy to make connections with Dart Unions. The Ball-Shaped Seat enables you to make a perfect joint without the slightest bother regardless of the alignment of the pipe.

The Joint is Bronze against Bronze. This makes deterioration at the vital part impossible.

And the pipe ends and nuts being extra heavy, there is ample strength to prevent stretching or pulling apart under unusual strain or heavy pressure

Dart Union construction means a saving of time for you and satisfactory service to customers.

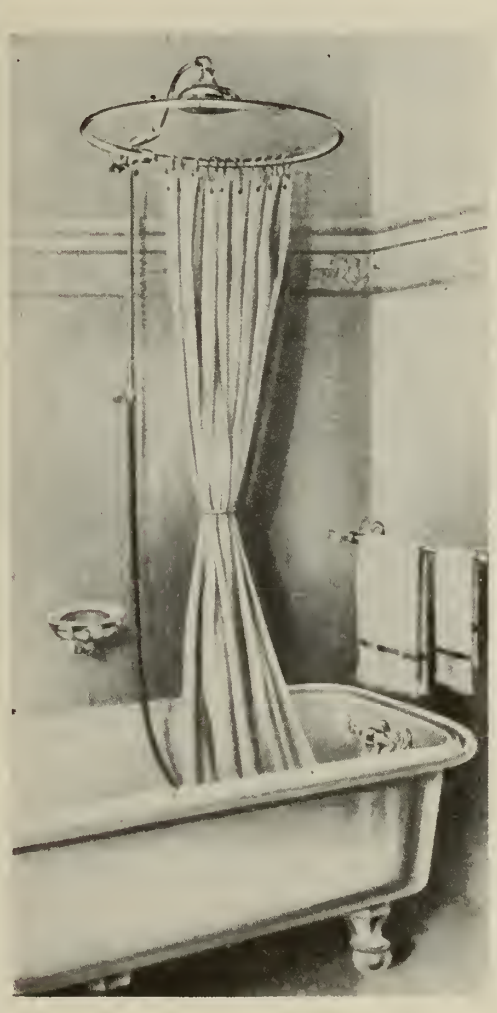
Sanitary Engineer

Plumber and Steamfitter of Canada

VOL. XIII. PUBLICATION OFFICE, TORONTO, APRIL 15, 1919 No. 8.

Wear-Proof Bathroom Supplies



BATHROOM facilities, luxuriously designed, or plain, no matter which, we supply them. Our lines are absolutely complete.

Bathrooms are not a luxury or a source of extravagance, but a lasting investment. Every householder knows this, and only needs to be informed of the great improvement made in the manufacture and appointments of this line.

Our literature and catalogues contain very valuable information as to what has been done in the development of these lines to their present degree of perfection. Every plumber and sanitary engineer should have this information; it helps him to properly advise his clients, and gives him an adequate idea of the great service we can render him in supplying every need promptly. Our lines are wear-proof.

No matter what you want in the way of bathroom and toilet supplies, heating facilities, water pressure system—we can supply your needs.

Write us.

The Septic Tank is the Farmer's Greatest Convenience

Specify "ANTHES" and you can be sure of absolute satisfaction

Now is the time to get after your farmer customers. They have the money to install a plumbing system, and it is only necessary to point out to them the great conveniences it will give them to get their order. We are advertising extensively in Farm Journals, and the great number of inquiries from all over the country indicate that hundreds of farmers are contemplating installing plumbing systems.

ASK US FOR INFORMATION. WE WILL SUPPLY YOU WITH CIRCULARS TO GIVE TO PROSPECTIVE CUSTOMERS.

We will furnish you with Septic-Tank blue prints on request.

We have received inquiries from the following towns: Walkerton, Oakdale, Listowel, Brockville, Fonthill, Lindsay, Fullarton, Cobden, Streetsville, and many others. If you are established in any of these places write us, and we will give you the names of the parties inquiring.

We have made a sweeping reduction in the prices of soil pipe and fittings, which was noted in the last issue of Sanitary Engineer. This should stimulate buying, and you might as well get out for your share of the business. Two of our newest lines in soil pipes are noted below.

WE ARE NOW MAKING A NEW LINE OF

LIGHT SOIL PIPE AND FITTINGS

Prices for which will be furnished on request.

ALSO

FLAT HUB MEDIUM PIPE AND FITTINGS

Which are the same price as the ordinary medium pipe and fittings

Ask your jobber for "ANTHES" Syphons, soil pipe and fittings.

TORONTO and WINNIPEG

SANITARY ENGINEER, April 15th, 1919, Vol. XIII., No. 8. Published 1st and 15th of every month at 143-153 University Ave., Toronto, by The MacLean Publishing Co., Ltd. Yearly subscription price, Canada, $1.00; United States, $1.50; Great Britain and the Colonies, 4s. 6d.; elsewhere, $2.00. Entered as second-class matter at the Post Office Department, Ottawa. Entered as second-class matter July 1st, 1912, at the Post Office at Buffalo under the Act of March 3rd, 1879.

MALLEABLE AND CAST IRON PIPE FITTINGS

The Brand That Has The Quality

"Quality" and "Reliability" are two essentials demanded of *Cast Iron* and *Malleable Fittings*, by all sanitary and heating engineers.

Time and money are lost by improperly made fittings. All our cast iron and malleable fittings are properly recessed and every fitting bears the above trade-mark of quality.

We make a complete and full line of both flanged and threaded fittings from ⅛-inch up, and can make deliveries from stock, both standard and extra heavy.

When ordering from your jobber be sure you buy---"the brand that has the quality." They are different. A trial order will convince you.

PIPE AND THE PUBLIC WELFARE

By R. C. McWANE

A Book Just Off the Press

Every sanitary engineer should be the possessor of this book. It deals with pipe-making of all kinds, cast iron, wrought iron, steel, wood and tile pipe. It is valuable because it gives the users of pipe a true idea of how pipe lasts under various conditions when in service.

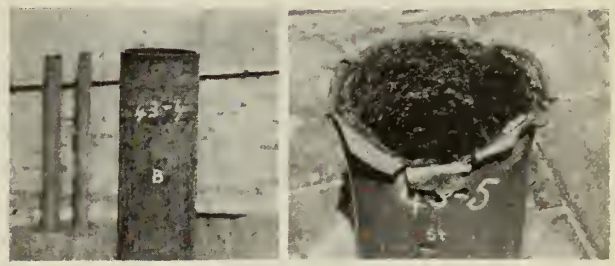
BYERS PIPE

GENUINE WROUGHT IRON FULL WEIGHT GUARANTEED

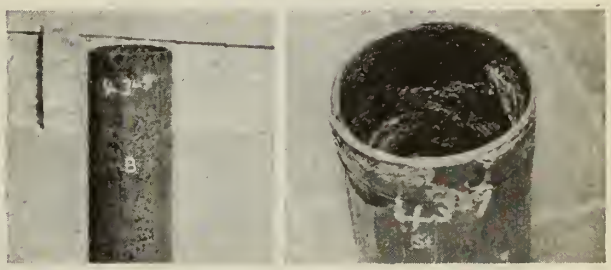
A $3,000.00 Saving Turned into a $100,000.00 Loss

A homely illustration of the difference in rust-resistance between Byers and other pipe, is furnished by the photographs on this page. As Byers pipe *looks* exactly like any other pipe, it has frequently happened that different kinds of galvanized or black pipe have been mixed up and installed in the same building, as shown. (Name on request.)

The *same* service, the *same* age, *identical* conditions of corrosive attack—yet how differently these pipes turned out after being put to the test of time and service! The building is still young—but the inferior pipe soon will have to be replaced at a terrific cost.

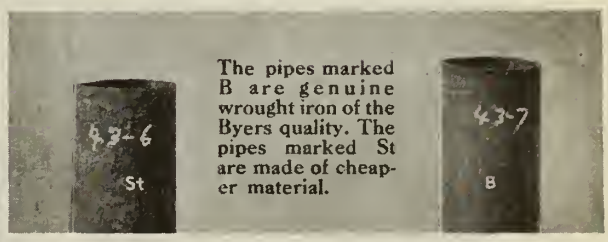


In a certain large metropolitan building, the initial saving effected by using pipe cheaper than Byers was $3,000.00. The total cost of the pipe *installed* was $45,000.00. Replacement started after five years, and has been continued ever since. The total ultimate replacement cost will exceed $100,000.00. The case is typical.



In residences and smaller buildings, ten or twenty dollars initially saved by using pipe cheaper than Byers, may later cause failures costing several hundred dollars.

In hundreds of buildings investigated, genuine wrought iron pipe of the Byers quality after 20 to 40 years' service has been found depreciated less than 10 or 15 per cent, while other pipe in the same and nearby buildings has occasioned costly pipe replacements after only five or ten years' service, the failures increasing from year to year as the buildings grow older. Illustrated literature on request.



The pipes marked B are genuine wrought iron of the Byers quality. The pipes marked St are made of cheaper material.

Bottum Valve Company

213 W. Schiller Street,
CHICAGO, ILL.

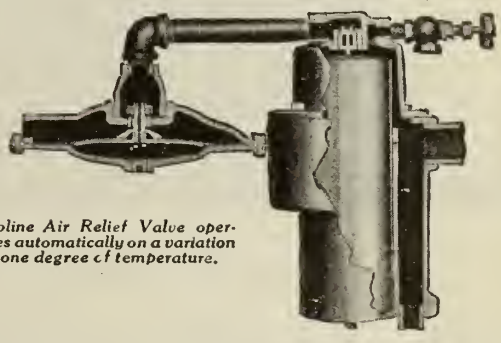
"You're exactly right, Bill— *in heating installation, it's* QUALITY *that counts!"*

"YES, partner, we have certainly had that truth pounded into us over and over in the twenty years that we have been in the heating contracting business. Haven't we seen one heating contractor after another lose customers simply because he tried to cut the price and thereby was obliged to skimp on quality?"

"You bet! It has certainly paid us to bid on Moline Heat every time!"

"Of course it has! You and I have always kept in mind the fact that a contractor is not through with a customer when he has finished the installation. If a contractor does a poor job, that means that the customer will complain to others. If he does a good one, one that gives PERMANENT satisfaction, that means the customer will praise his work and help him to get other customers. You simply can't get away from that rule!"

"That's the very reason we landed this contract and all the others we have landed in the past ten years, since we began installing Moline Heat. You can't fool a customer. HE knows what good heating should be."



Moline Air Relief Valve operates automatically on a variation of one degree of temperature.

"And that's why Moline Heat pays. It pays the customer, it pays the heating contractor. Quality counts!"

Add to your bank account and good reputation.

For full particulars, write to us today.

Some excellent territory still open for special sales representatives.

TRADE PAPER ADVERTISING

A Plumber in Toronto asked me why we did not devote all our advertising space to telling about the merits of PORT HOPE enamelware. He was good enough to speak highly of its quality, and said that he used it exclusively because it gave his customers such good satisfaction. Here is the answer.

The "Sanitary Engineer" is a Trade paper, its circulation is altogether amongst those who instal or who are interested in Plumbing work, and the majority of whom know from Catalogues and printed literature, the type and pattern of fixtures we make in our Port Hope Factories, and from a satisfied experience know the quality of goods we supply.

Advertising in a Trade paper would thus only reach those who are already well informed; it would only cater for business that has already been placed by contract and which could not be increased; in short, we would only bid for a share of the Plumbers' business.

A Trade paper to our mind is, or should be, for an entirely different purpose. Those who are in the Plumbing business, either as Manufacturers, Distributors, or Contractors, should use it as a medium for the exchange of ideas, always having in view the promotion and development of a bigger and better business, by creating a greater demand among householders for sanitary plumbing and modern bath-rooms.

It can be done by co-operation, and a healthy, helpful and vigorous campaign on the part of all who are interested would produce wonderful results. Would you like to express your views on the subject?

Making Use of Satisfied Customers

Regina Firm of Sanitary and Heating Engineers Make Practical Use of Testimonials From Satisfied Customers—Names, Addresses and Letters Reproduced in Advertisements

Written especially for "The Sanitary Engineer, Plumber and Steamfitter of Canada"

THERE is an old saying that a satisfied customer is one of your best advertisements. It is true to a certain extent but the value of the satisfied customers as an advertisement depends largely upon the extent to which the merchant uses the customer as an advertisement.

There are hundreds of customers, who when they buy a new home, a new car, a new heating system, etc., do not object in any way to the firm from whom they secured their purchase using their name when approaching other customers. In fact in many cases the original purchaser is rather pleased when the merchant points out that Mr. So and So in the next block or on the next concession is one to whom the merchant can point with pride as a satisfied customer.

Many of the most successful salesmen who do business in a big way carry with them photographs or drawings of installations or work which have been done by their firms in various parts of the country, and in this way by actually showing or demonstrating how the goods are being successfully used they can more readily convince their customers and land the order.

How Regina Firm Works

Working on this principle, Wagg, Wilson & Co., sanitary and heating engineers, Regina, Sask., are making excellent use of their satisfied customers.

On this page you will note two reproductions of advertisements which have appeared in Regina newspapers. One of these advertisements reads: "A modern plumbing and hot water heating system with a special tank system of sewage disposal will make your rural home complete. We will instal you a septic tank system of sewage disposal that is absolutely guaranteed. You need have no doubt about it working. We are not making an experiment at your expense, as we have them installed and working, not one, but many. Enquire from some of our rural customers listed below and get their opinion on the systems we have installed for them."

List of 40 Customers

Then follows a list of 40 satisfied customers to whom prospects are referred for opinions of the systems installed by Wagg, Wilson & Company. An advertisement of this kind is surely one of the most convincing arguments that a firm could use, not only to convince prospective customers who are now considering the advisability of installing systems such as those advertised, but also to reach out and secure new prospects, to start them thinking, and eventually secure orders from many of them.

This advertisement, as will be noted in the accompanying miniature reproduction ,was one that was attractively set up and bound to attract attention.

After Rural Customers

The two advertisements reproduced appeared during a farmers' convention which was being held in Regina. This company advertises in about twenty rural papers. The chief idea of the advertisement is to create an interest among the rural residents of the province. This firm selected a certain district or districts and through a process of intensive cultivation they are working the district thoroughly and doing their very best to close up a good volume of business. Their efforts are being concentrated to a great extent and through concentration in various districts they are able to create an interest which would otherwise not develop.

Complete Addresses Given

For instance in the list of satisfied customers six are given at Grand Coulee, six are given at Imperial, and five are mentioned at Simpson, Sask. Individual cases in some centres and two or three cases in other centres are also given in the list, and it will be seen that the list of satisfied customers includes names from many sections, and these names will be recognized by dozens of prospective customers. The illustration in the advertisement adds attractiveness and has a certain amount of pulling power. The advertisement is one which should attract a great deal of attention and in addition to pulling direct business it should start a great many prospects thinking and make them more sus-

Simpson Sask. June 28th, 1918

Gentlemen

Having used your Septic Tank since May 1st, 1917, I thought you would like to hear from me regarding the satisfactoriness of the system. Such it certainly is a wonder how it works. We have not had the least trouble with it any way. I don't know the ground was frozen when we started using it on the above date and as the filter beds are only two feet below the ground I am not yet why it did not freeze up but it did not. I must say it is a fine system. There is no smell from it, either inside or out. If you were not told where it was I can assure you could not tell. Far from it with our family and we used them and the Septic Tank for about a year before the others were put in time. It makes the place look just as good as any city home. If you care to use this letter or anyone wishes to inquire, I will be pleased to answer them.

Yours truly,

(Sgd.) W. B. WRIGHTMAN

Imperial, Sask. Feb. 6th, 1919

Dear Sirs

Re the Septic Tank and filter beds which you installed for me in the summer of 1917, I would like to say that it has been most satisfactory in every way. We have never noticed any smell from it, and it has never frozen or choked up, and has never given the least trouble in any way. We have not even had the manholes on the septic tank opened. Every part of the plumbing system has been very satisfactory. It has never given trouble in any way. We would not be without it for twice the cost. I cannot speak too highly of the system, and have no hesitation in recommending it to anyone.

Yours very truly,

(Sgd.) WM. J. GRAW

Testimonial letters are reproduced in the above advertisement.

ceptible to future advertising appeals or personal solicitation.

Actual Letters Reproduced

The second advertisement of the series headed "A septic tank system of sewage disposal with a modern plumbing and hot water heating system will make your rural home complete." goes on to state that "We have installed scores of the above systems. Get a list of our rural customers and inquire from them if our work gives satisfaction."

This advertisement is strengthened by the publication of two actual letters from satisfied customers. The first letter, dated January 26, 1919, is from Simpson, Sask., and reads as follows:

"Gentlemen:—

Having used your septic tank from November 15, 1917, I thought you would like to hear from me regarding the same —a septic tank. It certainly is a wonder how it works. We have not had the least trouble with it in any way, and as you know the ground was frozen when we started using it on the above date two feet below ground, I cannot see why it did not freeze up, but it did not, so I must say it is a fine system. There is not the least smell from it, either inside or out. If you were not told where it was. I am satisfied you could not tell. Far from it with cesspools. I have used them and never want them again. The septic tank for mine every time. It makes the farm house just as good as any city home. If you care to use this letter or anyone wishes to enquire, I wil be pleased to answer them. Yours truly,

W. B. WEIGHTMAN."

The second letter is from Imperial, Sask., dated February 6, 1919.

"Dear Sirs:—

Re the septic tank and filter bed which you installed for me in the summer of 1917, I would like to say that it has been most satisfactory in every way. We have never noticed any smell from it and it has never frozen or choked up, and has never given the least trouble in any way. We have not even had the manholes in the septic tank opened. Every part of the plumbing system has been very satisfactory. It has never given any trouble in any way. We would not be without it for twice the cost. I cannot speak too highly of the system and have no hesitation in recommending it to anyone.

Yours very truly,

WILLIAM J. SHAW"

These two letters from satisfied customers living in sections where this company is trying to do further business with other prospective customers should carry a great deal of weight and be very effective in securing additional business for Wagg, Wilson & & Co.

Part of a Series

The advertisements reproduced here are only part of a series but are reproduced for the purpose of showing our readers the class of advertising which is being carried on by this company. The advertisements are convincing. They drive home the fact that this company has produced satisfactory work for other customers. Actual names and addresses of customers are given.

It is quite common for salesmen or others to say that they have sold dozens or even hundreds of an article, but very often when you try to tie them down to a few actual cases they cannot recall offhand any outstanding cases where prospective customers may go and become convinced for themselves that the article or the work measures up to the claims of the salesman.

In these advertisements names and addresses are given and in two cases even letters themselves are reproduced in order to drive home the information which this company wishes to place before its rural customers and prospects.

Wagg, Wilson & Co. feature in their advertisements that estimates are given free and that country homes are a specialty with their company.

This style of advertising can be adapted to almost any line of goods sold or installed by the trade. The main thing is the idea behind this advertising to drive home to prospective customers the fact that you have satisfied customers to whom you can refer at any time. The company or individual possessing a good list of satisfied customers is certainly passing up an opportunity when neglecting to make use of this information which is of value to the advertiser and of great interest to prospective customers.

There are many ways in which information of this kind may be used including newspaper advertisements, folders, letters, verbally when soliciting business from prospective customers and in other ways.

The main thing is to use the testimonial as a legitimate means of securing new customers, and this is being carried out successfully by a great many firms.

Features of Next Issue

THE unique heating system for the new technical school at Hamilton, Ont., is causing a great deal of talk in trade circles. SANITARY ENGINEER has arranged for a big illustrated article giving all details for the benefit of our readers. This will be one of the best and most interesting articles ever prepared, descriptive of installations in Canadian institutions, and it will appear in the next issue.

There is a real, practical treat in store for our readers in the next issue.

Getting the most out of the territory is a problem with which many of the biggest firms in the country are struggling with at the present time. How can the members of the craft adopt the methods which have pulled business for larger firms? Watch for an article in the next issue.

Scott & Bennett, Galt, Ont., believe in modern display methods and have in their place of business a most attractive display of plumbing, heating and electrical goods. Photographs have been taken for SANITARY ENGINEER and an article on this firm's methods will appear in next issue.

Noble & Rich, London, Ont., when deciding on a location for their display rooms, located on one of the most attractive residential streets of the city, and at the same time on a portion of the street that is easily accessible from the main business section. Photographs of the Noble & Rich display rooms have been taken, and will appear with an article in the next issue.

The third article of the new series on Heating and Ventilating, by N. A. Kearns, will appear in the next issue. Judging by the comments of readers with whom we have discussed the series, this feature is one of the best we have had in a long time.

The foregoing are only a few of the features of the next issue.

We shall appreciate suggestions from our readers at any time. We also ask you to send in any news items of interest to the trade.

Displays That Attract Trade

Peter and Sylvester, Stratford, Ont., Show Sanitary, Heating and Electrical Goods to Splendid Advantage—The Value of Good Displays

Based on a visit by SANITARY ENGINEER representative to Peter & Sylvester show rooms at Stratford, Ont.

THERE is absolutely no question but that a fine display creates trade. It is just as sure to attract trade as the handing out of gold dollars free of charge would attract a crowd. "People sometimes think that I carry the idea of fixtures to an extreme," stated a leading merchant not long ago, but in my opinion they are just as essential in the winning of trade as bread is essential to the making of a meal."

The above expresses to a great degree the sentiments of Peter & Sylvester domestic, sanitary, and heating engineers, Stratford, Ont. For a prospective customer who appreciates beauty and utility in the home, this firm has a display that will serve as an inspiration, and drive home to prospective customers in a most effective manner, the fact that in the plumbing, heating, and electrical trades there are numberless devices handsome in design, practical in character, and of great labor and health saving value.

Before entering the Peter & Sylvester store it is most evident that the proprietors or their assistants are persons of good taste and with ability in window dressing, as their displays were of the kind which arrest the attention of almost any "home person" in these days of advancement in sanitary, electrical, and heating appliances.

The interior is divided really into two stores, though wide openings connect at the front and rear. In the right-hand room on entering is found an elaborate line of lighting fixtures, shown in one of the accompanying cuts. These are in most instances suspended from the ceiling, but tables down the centre of the room carry a wide line of globes and shades and also stand and reading lamps. Here also can be seen an electric grate and mantel, fully installed.

Electric stoves of the better grades are shown here also and these helps to home comfort are increasingly in demand. Vacuum cleaners, electric irons, percolators, toasters and the general line of household appliances are carried and aiso a stock of electric flash-lights, torches and batteries.

In the store at the left of the main entrance will be found a most imposing and well-arranged plumbing display. A wide range of baths, lavatories and closets is shown here and the customer has excellent opportunity of seeing different styles and grades. In this room the attention is called at once to the way in which bathroom fixtures are shown. Large panels covered with black velvet with light oak mouldings as frames, are placed on the walls and serve as a splendid background for the nickel and white fixtures which are fastened on the panels. It would be difficult to think of a more attractive method of showing goods.

Water Systems

In this room also is a residence water system set up ready for action and the advantage of such a display is evident when one is informed of the numerous systems which this firm has sold to residence-owners in the country

View of the display room of Peter and Sylvester, Stratford, Ontario. The accompanying article describes the display methods of this firm. Reproduction on another page shows electrical department in same store.

View in showrooms of Peter and Sylvester at Stratford, Ontario. This shows a section of the electrical department. In the accompanying article a description of the showrooms is given. Another view of the Peter and Sylvester show.

and other localities where the city water service is not available.

A hot-water heating boiler can also be seen here and full examination and explanation can easily be made. A striking feature was an ordinary kitchen boiler set up with electric heating attachment and attached to a basin with hot and cold cocks installed. Here was a salesman's opportunity without doubt, for what householder could fail to be attracted by turning a button and then a tap and having a stream of hot water gush forth?

Lady Assistants in Store

This store is one where ladies would be glad to spend pleasant and profitable hours, and there are lady assistants to assist them in their shopping.

The floors are of hard-wood highly polished and "walks" of a tastefully designed blue and white linoleum are laid down through the stores. The walls are papered in quiet and restful tones and a delightful finish is added by the presence of some very fine potted palms and ferns. Neat cards on walls and different items on show, call attention to "specials" and add greatly to the smart effect. In fact Peter & Sylvester have struck a very high note in the matter of store arrangement.

A very fine large cash register, electrically controlled, stands in the centre of the "electrical" shop, and to the rear of this store is placed the office fitted with modern office furniture, desks, filing and accounting systems, typewriters, cabinets, etc. The workshops are located upstairs, and storage wareroom in a nearby building at the side and rear. The motor car and truck comes into play in this firm also and contributes in every way to efficiency and profit.

To a SANITARY ENGINEER representative, Mr. Peter was very modest when complimented upon the remarkably beautiful and modern establishment which he had so successfully developed. He acknowledged that all of these details of taste, arrangement, extreme cleanliness, brightness and comfort had been carefully thought out and were found to be splendid drawing-cards for more and better business. Incidentally also he gave the information that the firm had just completed a large vacuum heating system in an adjoining town, and had also just finished an installation for the Kindel Bed Co. of Stratford, which included a generator and 27 motors.

Two accompanying illustrations will give the reader of SANITARY ENGINEER, an idea of how the goods are actually displayed in the Peter & Sylvester store. The show windows in the Peter & Sylvester store are also used most effectively.

The writer some little time ago interviewed one of the largest and most successful merchants in Canada. The talk drifted around to the value of displays, and the effectiveness of the display in the Peter & Sylvester show rooms, brings back recollections of some of the merchant's remarks. They are as follows:

"The window is the index of the store. If you want to find something in a book and that book has got very many things in it, the natural way to do is to look in the index. Just in the same way, if a man wants to know if I carry such and such a line of goods, if he dosen't want to go into my store to find out, the next best thing he can do is to watch my windows and see if he can determine it that way. We must get ideas of our merchandise into the minds of our customers. That is what we are there for. If it were not for that, a slot machine could do the work. Salesmanship consists in giving ideas to the customer, to appeal to the senses, not only to the eyes and hearing, but the other senses as well, particularly the sense of the touch.

"Every idea that enters the customer's mind is accompanied by some feeling, good or bad, and you can't help it, it is bound to be there. It is either for or against you. It may be big or little. It may be insignificant, but take one hundred little feelings that are against you and it makes quite a bit of bother. It isn't only the merchandise, but it is the way you sell your merchandise."

Discussions at Ontario Meeting

Thomas J. Minnes, of Brantford, is the New President—Reports of the Year's Work —Toronto Society Banquets the Visitors—Much Important Work to be Taken Up By New Directors—Ontario Society's Annual Meeting

Reported especially for "Sanitary Engineer," by C. E. PARSONS

EDITOR'S NOTE—The accompanying report covers the eighth annual meeting of the Ontario Society of Domestic Sanitary and Heating Engineers, held at Toronto. This report deals with many important matters of special interest to the craft and refers at length to many of the after-the-war problems which we are being called upon to deal with at the present time. Readers will also find the addresses of John F. Irvine, of Detroit, and Kenneth A. McIntyre, Toronto, of special interest. Reports of officers of the Association also contain a wealth of information for the craft. The initiation of 35 new members into Toronto society is also worthy of special mention.

MANY important matters pertaining not only to their own organization and the trade in general but to public health matters were dealt with at the annual meeting of the Ontario Society of Domestic Sanitary and Heating Engineers held in Toronto. A good deal of discussion centred around the new plumbing code for Ontario, which has been prepared and is only awaiting the signature of the authorities to become effective. It was stated that it is being held up because it is alleged the Gas Company brought pressure to bear on the Govehnment.

Will Get Busy Now

It was pointed out that the Toronto members are keeping right after this matter and endeavoring to get it through, but that members who reside in all parts of Ontario could lend very effective assistance by taking the question up with their district representatives in the Legislature and urging prompt action regarding it.

President Frank R. Maxwell, who was in the chair, pointed out that owing to conditions caused by the war, little has been attempted during the past four years beyond keeping the Ontario organization together. Now that business is getting back to its normal channels again he urged that the Society get busy as quickly as possible and endeavor to solve some of the problems of the trade.

The Apprentice Question

Discussing the question of apprentices President Maxwell pointed out that the situation is a serious one. At a recent meeting of the Toronto Society he said figures were obtained and it was found that among forty firms there were only three apprentices.

"You can see what this is going to mean to the trade," he said. "It will bring about much hardship. It will mean many half mechanics. As far as heating is concerned, the trade seems to be so heavy that boys will not work at it any more. Out of the helpers we will have to get the journeymen. In the United States they have helpers' unions. That is what is going to take place in Canada too, at least in the larger cities. We find great difficulty in getting them although the pay is as high as 45 cents an hour for boys to help the men. The young man of 18 is better every time than the helper of 35. There are too many half-baked mechanics. I know of cases where men of this sort out on a job were told only to make a noise, not to do anything as they would spoil too much of the material if they touched it.

Bought a Bond

In presenting the Trustees' Report E. H. Russell, of London, Ont., stated that a Victory Bond had been purchased with a portion of the funds. It was essential to have funds he pointed out, and he hoped that many new branches would be formed and more new blood secured.

The delegates to the Ontario meeting attended a special session of the Toronto Society of Domestic Sanitary and Heating Engineers in the afternoon and witnessed the initiation of thirty-five new members. F. R. Maxwell presided.

During the session John Bruce, of Toronto, official representative of the Plumbers and Steamfitters' Union spoke on "Industrial Democracy." He declared that industrial democracy has been subordinated in the past but is rapidly coming into its own.

"Men have been making sacrifices," he said, "for principles. Are these principles going to be carried out? I have been very pronounced in my views against the injustice workers have suffered during the war. These men are not cattle. They are human beings with rights. Their ambitions for better conditions not only for themselves but for their families is not wrong. It is laudable.

Masters to Blame

The masters are as much to blame as anyone for conditions. They have not made any attempt to meet the men or to get together and discuss things with them reasonably. To-day throughout the world we see a new spirit growing. A few have been amassing great wealth, while many suffered correspondingly by poverty. When the call came from the war, and freedom and democracy were the issues, it found men ready to sacrifice everything. Their participation has cost this world 10,000,000 souls. If clarification is not coming by fire and the sword then this catastrophe has been the greatest the world has known. We must try to raise the standard of democracy. You have a duty. Do not say it is no concern of yours. Solve the problem of bringing about better conditions."

The Whitley Report

Mr. Bruce discussed briefly the Whitley report, and told what was being done in England, where 162 councils have been established and are successfully operat-bringing about better conditions."

"Cut out this cold, calm, competitive system," he said. "The Government is doing little or nothing to combat this unrest that is abroad to-day. It needs men of courage and conviction to correct the evils that are creating that unrest. We can do our share by getting together as an industry and establishing a mutual council at which everything will be taken into consideration and at which we can try to unify business. We must try to create mutual relationships. Employers must get all this new idea. There is nothing greater before us than the study and solution of these problems. No one has any right to put his heel on the neck of those who are down and say 'You must stay there.' You are carrying on an essential work. The first consideration of the nation is the health of its citizens.

THE NEW OFFICERS

President, Thomas J. Minnes, of Brantford, Ont.

Vice-President, Geo. E. R. Grinyer, Guelph, Ont.

Treasurer, T. Maxwell, Toronto.

Secretary, Garret Frankland, Toronto.

Board of Directors—T. J. Minnes, Brantford; G. E. R. Grinyer, Guelph, and Thomas Maxwell, Toronto.

Auditors, Fred Gentle, Toronto; Fred Smith, Guelph; Harry White, Brantford.

Trustees, E. H. Russell, London, Ont.; W. Mahoney, Guelph, Ont.; Garret Frankland, Toronto.

Chairman of the Sanitary Committee, John Wright, Toronto.

Chairman of Heating Committee, Harry Waterman, Toronto.

Chairman of Arbitration Committee, C. Henry, Stratford.

Chairman Apprentice Committee, Geo. Clapperton, Toronto.

Chairman Educational Committee, K. Allison, Toronto.

New Health Department

"The continual hammering of the Labor movement has resulted in the creation at Ottawa of a Health Department. The rules and regulations that are to be put into force are of vital importance. I want to say that the rottenest plumbing system in North America is being put in at Ottawa in buildings which are costing millions."

Mr. Bruce also discussed briefly the Ontario Act in regard to health which is awaiting signature. He urged every member, especially those from out of town, to see the member of Parliament from his riding, and urge that this bill be put into effect.

"It is being held up," he said, "because some boreheaded politicians say that it is not in the interest of the public and can wait."

Guests at Banquet

In the evening the visitors were guests at a banquet tendered them by the Toronto Society of Domestic Sanitary and Heating Engineers. About 150 were in attendance and the affair was voted one of the most successful and enjoyable in the history of the organization. Frank R. Maxwell, past president of the Ontario Society, was in the chair, and following the supper called upon the new president, Thos. J. Minnes, of Brantford. Mr. Minnes spoke briefly, urging the members to co-operate in all the problems of the trade if they wished to solve them quickly and satisfactorily.

Must Work Together

The toast to "Our Profession" was proposed by Louis LeGrow, who pointed out the comparatively small and insignificant results obtained if any one individual tries to work out big problems alone.

"The way to work is through the association," he said. "It is a good thing for men engaged in like occupations to work together in solving their difficulties. That is the way to get results."

The toast was responded to by John F. Irvine, of Detroit, president of the Detroit Association of Domestic Sanitary and Heating Engineers, and also of the Michigan State Association.

How to Make Money

"It is absolutely impossible to make any money in this business," said Mr. Irvine, "without organization. Everyone in Detroit was making money but the plumbers. They were on the road to bankruptcy. We got together and formed an organization. We took in the smaller firms as well as the others, and we let them have just as much say in regard to how things should be handled. We now have over 200 hundred members and we meet every week. At our last meeting 195 members were on hand and those who could not come were represented by written excuses. We handle dilatory members roughly. We do not want them. If they are not interested enough to come out and work with us they are against us and we let them know it. We found out after we were organized that we had some good plumbers and some good steamfitters but that we did not have very many business men. That is one of the faults in the whole business world. Too many start out without an ounce of business knowledge. Someone had told them they could start with nothing and make profits of 20 per cent. and they go to it. They go into business facing overhead expenses of from 45 to 52 per cent. and there is no one there to show them the folly of their ways."

Taught Them Business

"We started out with just those difficulties. We soon found out that we had to make business men. We organized business associations and we got facts and figures. We found out all about overhead and other things and we gradually got things on a business basis. Overhead has got to be paid. The Government allows it and the Government has laughed at some of the biggest merchants and told them they were not charging enough overhead. In Detroit we want the public to know that we are business men. If any man can show us where we are wrong on our figures regarding overhead and the cost of doing business we want to be shown, but so far the only thing we have discovered is that you cannot cut down the amount we figure on for overhead without cutting down efficiency. We have educated our boys to go along and do good work. As a result of our policy in this direction we have practically eliminated troubles of this kind. If a plumber in our organization makes a mistake and it is reported a committee investigates within 48 hours. If the plumber has made a mistake or done bad work he has got to go back and make it right or give the man back his money. If he will not do this he is no longer a member of our organization."

T. J. MINNES

Brantford, Ont., elected President Ontario Society Domestic Sanitary and Heating Engineers.

"We do not want with us men who will not deal fairly. The architects have learned by experience that out association is with them. The public has learned that we do not want to rob them. We meet at any time on call within 24 hours and if there are things to straighten out we get busy and do it. The men not long ago asked for $1 an hour. We took the question up and showed them complete figures and showed them that their request was not justified. They wanted to compromise but there was no compromise, as when we asked them for their figures they did not have them and we had ours which were indisputable. We want to deal absolutely fairly with our men. We want them to have the comforts of life and to own their own homes. We have figured it out and our figures show that out of a man's earnings he needs 25 per cent. for eating, ten per cent. for clothes, ten per cent. for amusements, five per cent for doctor's bills, five per cent. for insurance to protect his family. He should put away fifteen per cent. for savings.

Apprenticeship Question

We have taken up the apprenticeship question. We realize that to make better business men and better mechanics education is needed. We are working between the unions and the mechanics We take the boys that we can train and give them three months in school with their wages and tuition paid. This work is being done for the betterment of the business and the betterment of the community. We do not want floaters or drifters. Our figures show that one man in time of trouble will control ten other men, and if we have the right kind of men we reduce troubles to a minimum.

Get Their Money

Another big problem we tackled was collections. Before we were organized I would not like to tell you how many thousands of dollars were owing to our men. We got busy on the problem. We put in a collection department. We have a first-class attorney and we pay him first-class wages. Just to give you an idea of the size of this work I might say that we have listed over 400,000 accounts. All are graded. If a new customer comes in we call up the secretary and find out what his grade is. In the old days we used to have people riding around in high-priced autos who owed maybe 15 or 20 firms. There was more than enough money owing us in Detroit to carry on all our work for more than five years, but we have stopped that. We are doing business on a business-like basis now and the people respect us for it."

The Business Situation

In touching on the outlook for business Mr. Irvine stated that many places were reporting business quiet in the building line because people had the idea prices were too high or were going to come down.

"My opinion," he said, "is that costs are going to be higher for the simple reason that wages will not be reduced and freight rates will if anything increase, especially if the Government handles them. The whole building situa-

tion centres around wages and freight rates. The building industries take 25 per cent. of the tonnage of the railways. Some of these people who are thinking of building now and putting it off waiting for prices to come down will wake up in about four or five months to find out that costs have advanced."

Urges Co-operation

John Bruce spoke briefly, discussing the labor situation. He said that labor was asking for better living conditions for all its members.

"It is absolutely inconsistent," he said, "to put things right over in Europe if we are not going to put things right at home too. We have a good deal in common. We must get closer together and work together. If you fight as individuals you will get nowhere. The world was made for you and for no one else. Grow and grow for good."

Gave Him a Cane

A very pleasant feature of the evening came next when Secretary Garrett Frankland was called upon by Past President F. R. Maxwell to make the presenttion of a handsome silver-mounted cane to J. F. Irvine. Mr. Frankland, in making the presentation, spoke of the work Mr. Irvine has done for the trade in general and of his visist to Detroit and the many valuable pointers he obtained. Mr. Irvine, although completely taken by surprise, thanked the members for their gift.

The New Members

The toast to "Our New Members." was responded to by W. Mahoney, of Gueph, who spoke of the pleasure it gave all to see the Toronto organization in such a flourishing condition. The taking of 35 members, he said, was an event of which any organization might be proud. He referred reminiscently to a meeting some years ago of the Ontario organization, at which only five delegates showed up.

The toast to allied organizations was proposed by George Waterman and responded to by Messrs. Dillon and Finnemore.

A recitation, "Democracy as Seen by a Soldier," by George Baker, was heartily encored.

"The Open Price Plan" was the subject of an address by Kenneth A. McIntyre, of the firm of Beattie & McIntyre, Toronto. By way of introduction, Mr. McIntyre, who is chairman of the Ontario Association of Electrical Contractors and Dealers, explained that the organization forms part of the Canadian division, in affiliation with the National Association in the U.S. The electrical industry is being organized along international lines and the movement, originated in California by W. L. Goodwin, is to include manufactures, jobbers and central stations; also that trade conditions and problems in the electrical industry very closely parallel those in the plumbing and heating business.

Business Ignorance

The product of the electrical or the plumbing and heating contractor is a finished installation. Many of the circumstances and conditions are beyond the control of the contractor, yet he must set a price on his work. If he be a successful contractor, using proper methods of cost accounting, he will be able to determine a price based upon cost plus overhead plus a reasonable profit. More often than not, this price is not the market price of his finished product. The market price may be that set by an ambitious competitor operating with total disregard for such important items as costs and overhead.

Past Measures

This condition first gave rise to the "price-fixing" idea, a practice not only illegal but unfair and ineffective. The result is to protect by artificially sustained prices the inefficient contractor. Proceedings cannot bear the light of day and the public becomes rightly suspicious,

GARRETT FRANKLAND
Secretary Ontario Society Domestic Sanitary and Heating Engineers.

bringing the trade into disrepute. Within the trade itself it creates a bad atmosphere.

Some years ago in the steel industry this scheme was tried with the usual result. Representatives of the different firms would get together and agree to charge certain prices for their products. After the meeting it would be almost like a race to see who could get to the customers first so as to cut under the prices agreed upon. Finally one man becoming disgusted announced that he would have no more to do with the scheme. He would not promise to maintain any prices but he would send to each of his competitors periodically a list of the prices he had already quoted. This was the "Open Price Plan" in its first form.

"The Open Price Plan"

This plan was originated by Mr. Arthur Jerome Eddy, of Chicago, a prominent attorney. It has been successful in many lines of business, and has just been recently adopted by the Toronto District of the Ontario Association of Electrical Contractors and Dealers.

A brief description of the procedure adopted for Toronto should make the plan clear to the reader.

1. The open price plan is open to every member of the Association, and each member is supplied with printed forms for reporting tenders.

2. Each member reports to the secretary an exact copy of tender together with summary of estimate. This report is sent at the same time and by the same means by which original tender is sent, (that is by mail, telegraph, telephone, messenger, etc.)

3. Upon receipt of this information the secretary exchanges same with all others who have reported tenders on the same job.

4. The successful contractor reports to secretary immediately upon closing job that same has been closed, and the price.

5. Notice of award is then mailed by the secretary to all members who have tendered on the job.

6. Meetings are held in addition to the regular business meetings, for the express purpose of discussing all the information obtained and the subjects of estimating and cost accounting. Minutes of these meetings may possibly be exchanged for those of similar meetings in New York and Chicago.

Not to Fix Prices

The object of the open price plan is not to fix prices, but to stabilize prices by publicity, much in the same fashion as transactions in stocks and bonds are listed on the stock exchange. Prices are made known only after they have been quoted. It is the intention later to have members report monthly cash receipts, average weekly pay roll, etc.

The results of the open price plan are to give members confidence in one another, to make business more efficient and to give increased business with less cost for estimating.

There must be a square deal all around, not only for the members but for the public. Publicity is desirable because understanding of the plan makes for confidence. Furthermore, the member who is given to unethical practices is driven into the open and either reformed or ostracized.

In New York City the members figure they saved $200,000 in the first year's operation of the plan, and the average number of tenders per job was reduced from about 15 to 4 or 5.

In conclusion Mr. McIntyre, referring to Mr. Irvine's talk, stated that the Toronto District Association in conjunction with the Toronto Local of the Electrical Workers, have provided for compulsory technical education of apprentices during the training period of four years. This technical course will begin in the coming Fall.

Following are the reports which were presented and adopted:

PRESIDENT AND DIRECTORS' REPORT

Fellow Officers and Members,—We are gathered together to-day to officiate on behalf of our Craft in the affairs of the Ontario Society of Domestic Sanitary and Heating Engineers Eighth Annual Meeting, and all of us must realize the immense field of opportunity that lies ahead for those who are to continue the work of this Society. if we as a craft are to secure the desirable conditions that are our just due.

Since last we met the conflict of right over might that had waged for over four years was brought to a finish, as far as the field of battle was concerned, and now rests in the hands of our Statesmen for a conclusion that must for all time assure the world at large freedom from oppression.

Many Afflicted

Many of us have lost dear ones, and in passing I must make mention of one of our own, who was one of the first to make the supreme sacrifice in behalf of all of us, one of whom I can speak personally, he having been an apprentice under me and for whom I performed the painful duty of severing one of his fingers, at a time when he had met with an accident, through cutting with a cold chisel his finger practically off. I refer to Captain Tom Lockhart, of Galt. We also have had several of our members returned, suffering from casualties of one kind and another. Walter C. Millar, of Fort William, who I am given to understand will never be able to work at our business again.

Now Game Warden

Another old guard in Edward Higginbottom, of Fort William, who assumed to do his bit over there, and is now game warden for his district, a position which Ed. can ably fill, I feel sure you will agree. Frederick Fainsbury, of Weston, is again with us after three years over yonder, and also Messrs. Kirtley, Griffith and Allan Forbes Keith, of the Toronto Committee, while Messrs. Harry Ruddick. who has been awarded the D.C.M., and Albert Crowne, are still to return. This will but go to show that we were represented in the big affair, and I feel sure, the record of our members will stand second to none for valor and effort while in the ranks of the soldiers of the Allied Armies. Another war that raged with great violence throughout this country and many others, was the epidemic of influenza that struck us most frightfully during the late fall, and while I surmise very few of us missed it entirely, I regret to record the death of one of our very esteemed young members in the person of R. A. Sell, of Waterloo, who was very suddenly taken off in October, 1918.

Carried On

Generally speaking I or your directors have no great programme of accomplishments to set before you for the past year because, as I stated last year, we would continue in office, and economically carry on until the war discontinued. Gentlemen, this time has arrived, and we have come to the point where organization in its most aggressive mode must be resorted to, so that we may place our Society in a position of authority for our craft in Ontario.

To do this requires capital, energy on the part of members as well as your officers, and confidence in the rights of our Society and its members in the mind of the public. Remember, cash co-operation and confidence.

Many Opportunities

Many, indeed, are the avenues open for improvement of the methods of operation carried out by the members of our craft in conducting their business, and no doubt some drastic change must take place before we shall ever secure ideal conditions of competition among our fraternity. But, I am prone to believe that whether we will or no, conditions will be changed for us in the near future.

The Labor Department of Canada have seen fit to inaugurate council, for conference between employer and employee, in numerous lines, and for one in which we are interested, there is the Building Trades Council, comprising representatives from the Toronto Builders' Exchange, the Master Painters, the Electrical Contractors and ourselves, together with those representing the labor organizations of the building trades.

Conference Board on Social Conditions

Another feature that is a step in advance of any past methods, is a plan called the Open Tender System, whereby all competing contractors submit copies of their tenders to their competitors. This will be fully explained to the members at our Convention by an authority on the method.

Our Workmen's Compensation is fortunately for all of us remaining at the 80 per cent. cut-rate for 1919, and several

KENNETH A. McINTYRE

of Beattie and McIntyre, Toronto. Mr. McIntyre delivered an address on the open price plan.

amendments, which allow a larger protection to the worker, will no doubt be added at the present sitting of the Legislature. Our Provincial Plumbing Regulations are in a state of status quo, and will most likely be ratified at any time now. Mr. John Wright, of Toronto, who has energetically taken this matter up, will no doubt have something of interest to us all to report at this meeting.

During the past year there has been formed a new Association covering the Dominion, in the interests of the Building Trades. This body styles itself The Canadian Association of Building and Construction Industries, and comprises everyone who is interested in the manufacture, distribution and installation of building and construction materials, being divided into three groups: the manufacturer, the general contractor and the trade contractor, like ourselves.

The first general conference was held in Ottawa on November 26, 27, 28, of 1918, and our Secretary attended as our representative, while Messrs. Blyth and McKinley, of Ottawa, also were present in the interests of our craft. Considerable progress was made at this conference, and to save going into same at length I will just note that anyone wishing to secure a copy of the proceedings of that meeting can do so by notifying the secretary of their desires. Again on March 3rd and 4th the National Council of this Board met in Toronto to appoint a Secretary and ratify other matters that came out of the general conference held in November last. Myself and Secretary Frankland attended these Council Meetings, as did also Messrs. Clapperton and Mansell, of Toronto, and Mr. James Ballantyne, of Montreal. I have been appointed a member of the National Council as representing our craft, and do believe that in the near future much good will result to us from the endeavors of this new body. Returning to our own organization I must make mention of the activities of the Canadian Society which this year will meet in Montreal on June 3rd and 4th. Headway has already been made in the West, the Province of Saskatchewan having held a very successful meeting last month in Regina, and signified their intentions of being present at the coming National Convention. We in Ontario must be up and doing, if we are to retain our premier position in the Canadian body, and every member should make it a point to be in Montreal on June 3rd and 4th of this coming summer.

In closing your directors can only once again mention the necessity of organization for our craft in Ontario, first of a local nature, and secondly provincial, so that the desired benefits that should be ours may be forthcoming through our combined efforts. It is for this meeting to decide on our future policy in this regard, and we say unhesitatingly, all hands be up and doing, or we as a body will have to stand back and see our rights encroached upon from all sides and by all other interests.

We thank the members for the honor placed on us for the past several years, and trust that our policy of retrenchment, which shows in the very handsome start made in purchasing a Victory Bond for five hundred dollars, will meet with your approval, and be the nucleus of a greatly increased invested capital in the interests of our society.

Thanking you again, we are

Yours respectfully,

The Directors.
J. R. Maxwell, pres.
Fred. H. Gentle, vice-pres.
Thomas M. Maxwell, treas.

Following is the report of Mr. John Wright, Toronto, on the Provincial Plumbing Regulations.

Mr. President and Gentlemen, — As Chairman of the Sanitary Legislation Committee of your Toronto Committee, and being in direct touch with the Provincial authorities, regarding the enactment of our proposed plumbing regulations for the province, in amendment of Schedule B of the Public Health Act, I beg to report the following progress in the matter to date.

For your information I include the following extract from the Report of the Provincial Sanitary Engineer, Mr. F. A. Dallyn, B.A.Sc., C.E. (Toronto), to the Chairman and members of the Provincial Board of Health, Ontario, under date of July 8th, 1918, and included in the Thirty-sixth Annual Report of that body.

Annual Report

Mr. Dallyn says in part: Gentlemen, I have the honor to transmit herewith my annual report for the year 1917.

The extension of water and sewerage works amounted to the sum of $2,880,534.72, including waterworks systems and extensions, as well as sewerage systems and extensions, as well as water purification and sewerage disposal.

The plumbing by-law has been further revised and brought to what appears to be a satisfactory conclusion. The subject is dealt with in some forty-five pages and the material sub-divided into 250 sections. It

deals with sanitation in rural sections without sewers, local organization in urban communities, plumbing inspection, details of and minimum requirements for the installation of plumbing, not only in urban centres, but in the province and rural communities generally, and with the standardization of the weight of fittings, drainage pipe, etc., required for and generally used in this class of work. The amount of labor involved in the regulations respecting sanitation (plumbing, etc.) has been considerable, but it is felt that the advantages will more than counterbalance our effort in the matter. The advantages to be derived from the regulations are that with the general improvement of property evidenced, not only in urban communities, but in rural communities as well, the work of installing sanitary conveniences, of the water carriage type, will be carried on in a sane and proper manner and that this expansion will not be subject to exploitation. Plumbers, after the passing of the regulations, will not be able to obtain business in competition through the use of inferior materials and inferior workmanship, either of which are exceedingly expensive in the end and subject the owners to considerable risk for nuisance.

Under Consideration

I also include the following insert, as taken from a letter I received from the Provincial Secretary. The question of the adoption of certain regulations in connection with the instalment of sanitary conveniences, plumbing, water service connections, house connections to sewers, etc., and gas fitting, is receiving careful consideration, and it is hoped it may be found possible to get these in a form satisfactory to all concerned.

The above will show you, gentlemen, the situation the regulations stand in at present, they having been passed by the Provincial Health Board, and the Cabinet, and now only await the signature of the Provincial Secretary to make them operative.

I strongly recommend that the members interview their local representatives in the Provincial House, and secure their assistance in bringing to the notice of the Government, the necessity of the early enactment of the Amendment of Schedule B of the Public Health Act. Also to refrain from having any local plumbing by-laws adopted, until the provincial regulations are enforced. Thanking you, I am, yours respectfully, John Wright.

THE REPORT OF THE EDUCATIONAL COMMITTEE FOLLOWS

Gentlemen.—During the period of the war your Educational Committee have been attempted or accomplished along the lines of eduction of the craft.

Now that a permanent peace is at least in sight, however, the writer feels that opportunities are presenting themselves, which will never be available in just the same way again, and urges the prosecution of a vigorous campaign along lines arranged by a program committee, a bare outline of which is hereby submitted.

Demand Attention

Some of the numbers affect the manufacturers, some the contractors, but all of them affect all of us and, hence, demand attention if we are to place the business on a more substantial footing. Here are a few suggestions:—

(1) A bumper convention.
(2) Re-arrangement of fees on a sliding scale; to include manufacturers, jobbers and contractors.
(3) The adoption of a standard set of books.
(4) Adopt better cash discounts.
(5) Standard apprentices' working rules.
(6) Standard specifications.
(7) Pipe manufacturers to adopt standard resale price for pipe.
(8) A central office.
(9) The restriction of the plumbing trade to its legitimate channels from manufacturer to jobber to consumer.
(10) A standard resale price list on all plumbing goods and a standard guarantee.
(11) A forceful advertising campaign.
(12) The open price system.

Just at this point may I offer a few suggestions taken from a letter of R. L. Tansel, sales manager for the Vaile-Kimes Co., Dayton, Ohio.

Should be Stopped

The practice of selling goods to a consumer is wrong and should be stopped. The public will have to learn sooner or later that the place to buy plumbing material is from a sanitary engineer; that a sanitary engineer's judgment is worth something; and that he cannot accept responsibility for goods that he does not sell himself. When people wake up to the fact and realize that a sanitary engineer's advice is just as important as a doctor's advice on medicine or a lawyer's advice on law, then, and not until then, will things be satisfactory.

A Common Practice

A common practice, which, no doubt, you are all familiar with, some fellow is out

JOHN F. IRVINE

President Detroit Association of Domestic Sanitary and Heating Engineers who addressed Ontario Society. His address is incorporated in accompanying report.

of a job, does not know anything at all about sanitary engineering—he may be a good blacksmith or salesman—the sanitary business looks like easy money to him and without much trouble he gets the agency for a line of goods you handle. Of course, if price is the only consideration, you cannot expect to compete with such competition as this. You lose the job. The Jack-of-all-trades installs it. This, of course, causes trouble and it is brought about by manufacturers who are willing to sell their products to any Tom, Dick or Harry who wants to buy them.

May Sell Direct

Then, again, suppose you have an agency for a certain line and have made a number of sales. Maybe they have given good satisfaction, due entirely to your skill in making the installation. You are making a reputation not only for yourself, but also for the manufacturer. A few months afterwards that manufacturer sends a salesman into your territory and sells direct or he sells to some blacksmith shop or junk-dealer up the alley. Again, you meet unfair competition. The other fellow gets the benefit of the advertising that is the result of your good workmanship on jobs that you have installed.

Should be Endorsed

The supply house who sells only to legitimate plumbers, leaving out entirely the Jack-of-all-trades, should be endorsed by this organization, and not in any small way either.

There is a solution as to how we can deal with the matter to prevent manufacturers selling direct to big mail order houses, if we can find it. Our friends across the border, who are wide awake to the facts that their interest must be looked after, are moving in the right direction and meetings have been held—educational campaigns have been decided upon—and they are asking that this be carried on vigorously and extended to other States. Such a campaign will make sanitary engineers better merchants, raise their prestige and increase their profits.

Urges Co-operation

The purpose of this program is to amicably discuss problems and evils confronting the sanitary engineers and to secure the co-operation of jobbers and principal manufacturers in solving them to the best advantage of the trade. These conferences are in reality the preliminary to a number of others of like character that are to follow, with the expectation of developing remedial and promotional measures in a definite concrete way. District meetings are being held in various sections in the States so that the many unable to leave their place of business to go to headquarters will be kept fully informed and their ideas secured. The dominant note of these meetings was "co-operation" between legitimate sanitary engineers, jobbers and manufacturers. It is told that there was case after case described in support of the contention that there was a lack of triple co-operation, this being harmful to the interest of all.

Must Use Discretion

Expression from the trade made it clear that the manufacturers and jobbers should exercise more discretion in placing goods and extending credit, as to the ability and responsibility of men, to be given recognition as dealers. Instances were cited where credit had been given too freely to inexperienced or irresponsible men breaking into the plumbing business and who ultimately failed. The extremely low bids they made on jobs not even covering cost or expectancy of paying for material they obtained on credit, it was suggested that steps be taken to eliminate these evils. This was agreed upon and plans are now under way to definitely pursue and work out. It was freely admitted that, generally speaking, the sanitary engineers have neglected to develop their merchandising possibilities with the result that outsiders are attracted by the prospect of sales profit.

Seek Information

Manufacturers who are "right" with the trade will be asked to give their co-operation to these meetings by sending representatives who are competent to give helpful information as to business-building methods, the result of sales campaigns of various kinds, the proper use of advertising space and material, etc. In fact, everything that has been advocated by our American friends could, with benefit, be followed by this Society.

In conclusion, let me say that while no hard and fast rule can be laid down for any course of action by the executive of a committee without a great deal of consideration, it is the earnest desire of the writer to see at least some of the points as outlined carried out, believing that in doing so we will not only profit individually, but will have rendered a distinct service to the trade in general that will leave the mark of "progress" stamped indelibly on the past performances of the Association of Domestic Sanitary Engineers.

(Continued on page 38)

Doubles Business in Five Years

Progress Made in the Retail Plumbing and Heating Department of the J. H. Ashdown Co., Winnipeg—Farmers Investing in Modern Equipment

Written for "Sanitary Engineer" by H. L. SOUTHALL

Editor's Note.—The accompanying article on the business of the retail plumbing department of the J. H. Ashdown Co., Winnipeg, throws some interesting sidelights on the possibilities which exist for the sale of modern equipment in both city and country. There are some members of the craft who are critical of firms doing a business in these lines without also making the installations. No attempt is made in this article, nor is it the intention in this article to condemn or justify the practice, but rather to place before our readers the facts as they exist, and the manner in which this company has within a few years practically doubled its business on the lines in which we are interested.

DURING the past seven years the business of the retail plumbing and heating department of the J. H. Ashdown Hardware Company, of Winnipeg, Man., has nearly doubled.

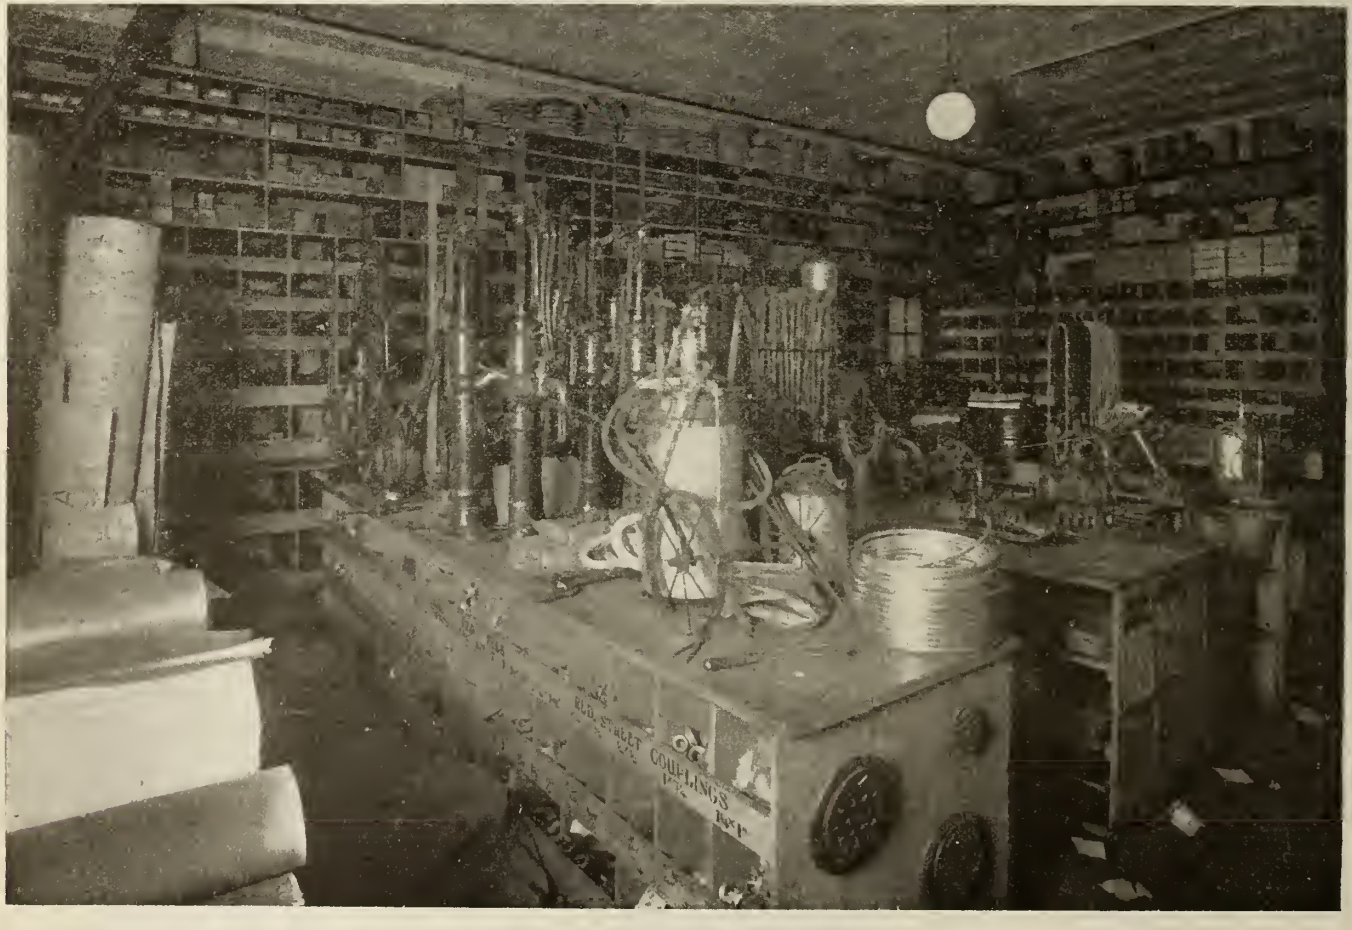
Originally the wholesale and retail business was conducted in the same section of the store, at which time, Sam Tait, well known in the trade of the West, was manager of the department. Seven years ago the two sections of the department were separated; and for the past five years the retail department has been under the management of Wm. Shannon.

The plumbing and heating department now occupies approximately 1,000 sq. ft. of floor space, with adequate cabinets and display cases, etc. This is in marked comparison with the situation when the wholesale and blacksmith departments sandwiched the retail department between them in the equivalent of the space now occupied by the retail business alone. Of course, considerable space on upper floors was devoted to the wholesale end of the business at that time in addition to the limited space on the ground floor.

The enlargement of the retail department has been very necessary to keep pace with the greater volume of business being done, which now averages in this department alone about $100,000 yearly turnover.

Three outstanding phases of the plumbing and heating business are emphasized by the retail department of the J. H. Ashdown store. These three include farm business, factory and mill supplies and plumbing repairs.

The average Western farmer has had larger monetary returns from his crops in recent years than formerly and has shown more enthusiasm in the modernizing of his home. The advent of the automobile, tractor and other up-to-date equipment on the farm has helped the farmer to a better understanding of the necessity for installing modern equipment throughout. Many of them indeed have been sufficiently sane to spend the equivalent of the price of a pleasure vehicle on home equipment and wait till



Section of the plumbing goods department of the J. H. Ashdown Co., Winnipeg, Man. The accompanying article gives details regarding business of the department.

next year to buy the automobile or tractor.

Farmers in the Market

For this reason a larger number of farmers are in the market for rural plumbing, heating plants, water systems, and electric light plants.

This business is sought by the J. H. Ashdown store by means of advertisements placed in the newspapers of rural districts within a radius of approximately one hundred miles of Winnipeg. Best results have been achieved by concentrating on a district of this extent rather than attempting to cover the whole prairie district.

Mention is made in the newspaper announcements of a catalogue giving full details of the water and electric light systems and pumps, and this plan has been largely relied upon for the development of business.

Prices are Quoted

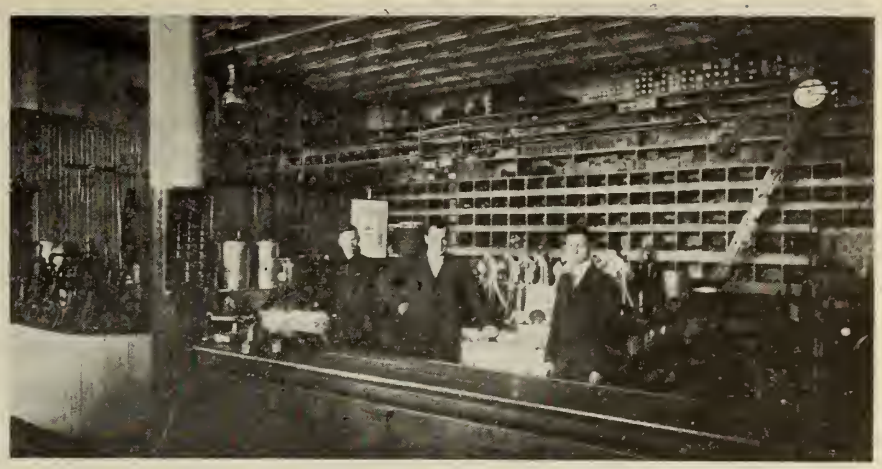
Figures have been compiled showing the cost of various complete household systems, so that the farmer can readily comprehend what he will have to pay for the equipment. The average cost of a plumbing and heating system is from $1,000 to $1,200. This figure does not include cost of an engine for pumping as it has generally been found that many farmers already have this equipment. This figure is cheaper than similar equipment would cost in a city home as the farmer is not called upon to comply with certain city by-laws in regard to plumbing which increase costs.

Furthermore, this cost does not include installation as the Ashdown Company does not employ plumbers and steamfitters for this purpose. It is stated in the company's literature that the systems are not complicated and that a man with average skill can instal them. Generally the farmer purchasing such a system hires a man from the city or nearby town for the purpose of installation.

A specialty is made of one type of gas engine ranging from 1½ h.p. to 9 h.p. It has been found by this company that an engine of this type and power is best suited to farm requirements for chopping, pumping, and electric light systems. Obviously the most popular engine with the farmer is the one which gives least mechanical trouble under the heavy strain of constant running.

Factory and mill supplies constitute another important phase of the Ashdown business in the retail plumbing and heating department. A specialty is made of such lines as valves, packing, piping, hose, and other fittings, etc., for this class of trade. To secure this business a man is engaged to constantly visit local factories, hospitals and other large institutions. For this trade the Ashdown store holds an exclusive agency for a line of valves, pumps, etc.

Plumbing repairs is another active department in this business, and Ashdown's have an extensive line of such repairs. A specialty has been made of repair parts, with the result that at the present time there are over two hundred different repairs catalogued and listed in cabinets. A special cabinet containing 32 drawers, each divided into numerous small sections is now being constructed in order to cope with the constantly-increasing number of repairs which it is necessary to have in stock for the many new lines of plumbing goods coming on the market from time to time. These repairs are for bibs, plush tanks, etc., and a very complete line is carried.



View in Ashdown Department in 1914.

WM. SHANNON
Manager Plumbing Department of J. H. Ashdown Co., Winnipeg, Man.

Some idea of how the plumbing and heating department of this store has grown in the past few years may be had in comparing the present extent of the department occupying 1,000 square feet of floor space with the department as shown in the illustrations accompanying this article.

FIRES ARE PREVENTABLE

The Ontario Fire Prevention League, in affiliation with the Ontario Fire Marshal's office, has issued an interesting bulletin entitled "Fire Prevention on the Farm and Elsewhere."

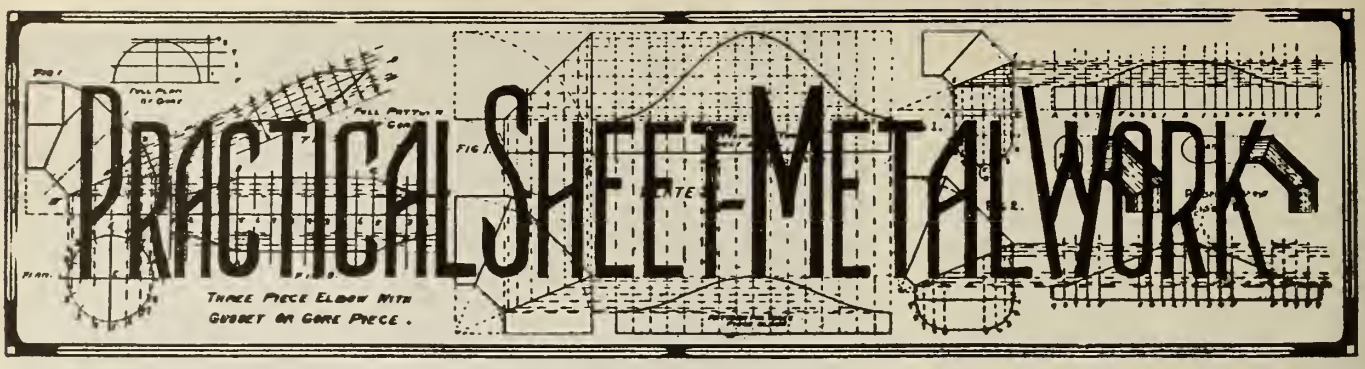
The bulletin deals in a concise way with common causes of fires on the farm and elsewhere, and points out that a tremendous proportion of the fires in Ontario are due to carelessness in taking proper precautions. The fire waste in Ontario, according to the bulletin, exceeds $40,000 per day, which means a tax of $6 per capita on the population of the province. The bulletin recommends a reversion to the Mosaic Law, which is still in force in many European countries, which says that to have a fire is a crime.

AT THE LYONS FAIR

Among the exhibitors with their representatives in the Canadian section at the Lyons Fair in France, are London Concrete Machinery Co., London, Ont., John C. Doidge; Pedlar People Limited, Oshawa, Ont., W. E. Clarke; Beatty Bros., Ltd., Fergus, Ont., M. J. Beatty and Flt.-Lt. R. B. Stewart; Pacific White Lead Co., Ltd.; Canada Foundry and Forgings, Ltd.; Standard Chemical Iron and Lumber Co., Ltd.; Pratt & Whitney Co., of Canada, Ltd., Asbestos Manufahturing Co., Ltd.; Welland Vale Manufacturing Co., Ltd.; Metallic Roofing Co., Ltd.; Bishopric Wall Board Co., Ltd.; David Maxwell & Sons, St. Marys; Richards-Wilcox Canadian Company; McClary Manufacturing Co.; A. N. Smith; Taylor Forbes Co., Ltd.; C. Martinier; T. S. Simms & Co., Ltd.; L. W. Simms; Brandram Henderson, Ltd.; Chas. H. Gratton.

COAL RESOURCES OF BRITISH COLUMBIA

The Crows Nest coal field is the most important body of coal that is being mined in British Columbia. It includes an area of 230 square miles. The coal is a high grade bituminous, occasionally running into anthracite, averaging about 64 per cent. fixed carbon. Much the greater portion of the coal is converted into coke, the remainder being sold as steam coal. There are 22 workable seams, with a total thickness of 216 feet, 100 feet of which is estimated as workable.



BY THOMAS STANSFIELD

ONE of the main features in the management of a tinshop is to be able to use the patterns for more than one article when there is a similarity. Take a 90-degree elbow pattern of, say, 6 inches diameter, or any diameter, for that matter. Suppose a pattern for a roof flange is required for a pipe 6 inches diameter or any diameter, and the slope of a roof is 90 degrees, all that is required would be to cut out a piece the shape of the pattern, make it up into a pipe, and stand the mitre end on the flat sheet of metal from which the flange is to be made. Mark round the pipe at the mitre, and the pattern for the hole in the flange is procured. The same with the flange piece to fit on the ridging. If the pitch of the roof is, say, 90 degrees, the same method can be followed, and by simply bending the flange at the middle, the piece is ready to fit to the roof.

This does not apply to 90-degree sloped roofs only, but to any slope. The various elbow patterns can be used in this same way, and much time can be saved. While it is not the technical method, "the kink will do the trick," and is a time-saver.

Fig. 1 shows the perspective view of a pipe extending through a roof with plan, elevation, and pattern. The proper way to develop the pattern is by first drawing the plan and elevation. The sloped line in elevation represents a 90-degree pitched roof. A B C D is the pipe extending through roof.

Divide the half plan into equal parts, with X5 as centre. Now draw a number of vertical lines from 1, 2, 3, 4, etc., to line E F, which represents not only the slant of the roof, but also one side of the pattern for flange. From the various points on line F E draw dotted lines parallel to lines F G and E H, and divide the flange by drawing line J K through the centre, and number this line with the corresponding figures on plan.

Next place the point of the compass on line drawn through the plan and open to 2, transferring this measurement to the line K J, cutting dotted line 2, and transfer all the measurements from plan in the same manner until all the dotted lines have been intersected.

By connecting these points as shown by solid line, the pattern of the hole for flange is procured.

The same method is adopted whatever the slope of the roof may be.

Fig. 2 shows the perspective view of

What About the Slow Pays

Persuasiveness and Punch in the Collection Methods Pulls in the Coin—Letters That Brought Results

THERE are few members of the trade who have not at some time or other been more or less worried over the way in which book debts have piled up, with consequent annoyance and embarrassment to the dealer, but not to the debtor.

Some merchants have lost faith in the efficacy of the collection letter. They question its ability to return with the goods, yet an Eastern Ontarid firm by putting a little different tone to the etters have found them the means of assuring a collection in a multitude of unexpected cases.

Debtors can be placed in several classes, but "slow and sure," "forgetful," "hard to part" and "don't want to pay" are the best known ones.

The old stickers with their cut and dried phrases and smart sayings have come to be looked upon as almost a friend by the class of debtor who gets them so regularly from different merchants. Were they to cease to put in an appearance they wuold be missed and leave an aching void in the regular round of expected events.

Then you come to the usual letters asking for payment. It will be noticed that the majority of these in cold, formal, matter-of-fact language pass without results.

A little human interest pushed into service would work wonders and draw the cash.

An Eastern Ontario firm had endeavored in every way to collect by ordinary letters, stickers, lawyers and also by special collectors.

The letters brought few returns, the stickers were useless, the lawyers were as hard to get the money from as the people from whom they had collected it, while the special collectors frequently brought home less than their day's wages amounted to.

Then came the letters with the human touch. There are five of these little fellows, each with a distinct work to do and they won out, making nearly 30 per cent. cash payments as well as a large number of settlements, either with notes or written promises to pay.

The best part of the success was the fact that a number of accounts that were five, six, eight or even ten years old and therefore outlawed, came in as a surprise packet to everybody.

These letters were printed in imitation type to match the machines used in the office. Names and addresses were added and each letter signed by the head of the firm. Including paper and printing, the letters cost a little over one cent apiece. Five hundred sent out brought in over $2,500 in hard cash within seventy days of posting the first letter, in addition to which many other settlements were arranged.

No ill feeling was caused and in several instances customers bought more goods immediately the old accounts had been adjusted.

Letter No. 1 was sent to people with recent accounts and was very successful in getting cash which would have laid out for some months. Letter No. 2 was sent to customers with older accounts and was followed by No. 3. No. 4 aroused those with a slumbering conscience. Letter No. 5 was rarely necessary but when sent gave good results. Cash was received in less than 48 hours in some cases.

Here are the letters. Nothing smart, nothing fancy, but they worked:

LETTER NO. 1

The statement of your account enclosed with this letter shows the same to be of recent date.

Present day conditions of business compel us to alter older methods, and we find it is impossible to give the extended credits which were possible in the past.

You will quite understand our position in this matter and we believe you will accept the letter in the spirit intended.

Your remittance will be sincerely appreciated and at the same time we solicit your continued patronage which we assure you will receive our best attention.

LETTER NO. 2

The enclosed statement of your account shows the same to be long-standing.

We feel sure you would be glad to have the matter settled and off your mind, but you cannot be more anxious than we are. Cash is badly needed. Will you help us by remitting at once.

Yours Respy.,

LETTER NO. 3

We wrote you a short time ago to draw your attention to our account long overdue.

Has the statement been laid aside and overlooked? In case this is so, we enclose another one which we very sincerely hope will be returned with your remittance by return mail.

Yours Respy.,

LETTER NO. 4

Your statement of account enclosed with this letter is much overdue. When the courtesy of credit was extended to you, it was because we believed in your willingness and ability to meet your obligations. We hope you will endeavor to prove our expectations were correct by remitting quickly, a favor we shall very much appreciate.

Yours Respy.,

LETTER NO. 5

We regret our previous letters in regard to the statement enclosed, have remained unattended to. Your failure to remit has placed us in an unpleasant position. Unless this account is paid it must be collected and cost of collection added to it which is unnecessary. Kindly attend to this matter within 10 days from this date so that we can keep the account in our hands instead of passing it over to our agency.

Yours Respectfully,

LETTER NO. 6

And in the event that all these letters failed of their purpose there is still this possible sixth letter. It does not appear in the series noted herewith. It is added by this paper out of pure good heartedness.

What does it say? Supply the words yourselves. You have all had experience with these customers who are deaf to the blandishments of the most persuasive letter: frame then the opinion of these folks and write it here.

EDITORIAL COMMENT

A SAFE MARGIN

EVERY business man to-day is paying a great deal of attention to his buying. But of almost equal importance is the matter of selling. The merchant who has not already done so, should immediately analyze his business affairs and ascertain whether or not he is securing a safe margin of profit.

HONESTY PAYS

BUSINESS reputation is built by years of patient endeavor. The corner-stone of all enduring business is honesty. It matters not whether the principle is applied to the sale of a five-cent article or to a million-dollar article. If the customer feels that he has obtained value for his money and has not been duped he will come back again. Retention of old customers and addition of new ones is the law of business growth.

OUST THE SALE KILLERS

AN authority who has had an opportunity of investigating many businesses in almost every line states that a great fault with many small dealers is, they have little back-bone. The first dull day puts them in a pessimistic mood. They lie down at the first crack of the whip and go so far as to tell a prospective customer about poor business and tight money. This pessimistic talk is not always confined to small dealers, for I can cite a good-sized furniture dealer who recently had a lesson which should last him a lifetime.

He, himself, waited upon a prosperous farmer and his wife desirous of refurnishing their home. After several hundred dollars' worth of furniture had been selected and the farmer was about ready to pull out his wallet to pay for his purchase, this furniture man said, "We are glad to make this sale, you know the war has affected business here in the city—money seems tight, and it's fortunate for us merchants that you farmers have the money to buy." Mr. Farmer turned to his wife and said, "Sarah, if money is getting tight, maybe we had better wait a little while before buying this furniture"—and they did.

Lack of confidence, lack of back-bone and lack of vision has lost many sales. Big business to-day is not being done on a price basis alone. There are exceptions of course, but in many cases the men who are making the most money are those who are out to sell a good product at a legitimate price. Lack of back-bone when it comes to asking a fair price for an article or installation has caused the business downfall of many men. Too many people in business take the view that the buying public is only interested in price. Such is not the case. If you quote a fair, legitimate price you should have no trouble in convincing the prospective customer that he is going to get good value for the money expended. The great trouble is that too many men quote a price and then fail to back it up with a good selling talk if the customer objects to the price quoted. When people have the money to spend they will pay the price for the good article if the merits of the article are played up in the proper light. What we need is more salesmanship and less haggling over mere prices. The subject of "Home Comforts" is a live one to-day, and if any class should, and can get a fair price for home comforts to-day, it is the members of the sanitary and heating trade. Not only do opportunities exist in the villages, towns and cities, but also in the rural communities. One close observer has truly said, as a reward for the arduous labors of the past half decade, thousands of farmers have replaced the old-time stoves with modern heating plants. In like measure there has been adoption of modern plants for supplying water under pressure, which has opened a market for hot water heaters and all manner of plumbing specialties. The installation of home-lighting outfits has followed as a logical sequel in localities where connection could not be made with transmission lines that open to the rural household all the resources of modern electrical appliances.

Canada is aglow with opportunities at the present time, and a close analysis will prove that in many cases the opportunities exist at our very door, and are so obvious that to us they have become common-place and we have been passing them up.

A COSTLY WASTE

PROPERTY valued at more than $40,000 was destroyed in Ontario every day last year. The unfortunate thing in connection with this, aside from the tremendous loss involved, is that the great

percentage of this damage was due to extreme carelessness and might easily have been prevented. Rubbish and fire are twin brothers. One of the most prolific causes of fires was matches, cigar stubs or cigarettes dropped carelessly into rubbish. You can help prevent fire by not allowing rubbish to accumulate. You can help stop Canada's enormous fire loss by using reasonable caution in the storing and handling of oils, gasoline, paints and other volatile liquids. Oily waste thrown anywhere makes a dangerous fire hazard. The high cost of fires has a whole lot to do with the high cost of living in Canada.

KEEP BUSINESS MOVING

TO-MORROW'S dullness may be prevented by to-day's activity. This is especially true in the business world. Business prosperity ultimately depends upon the consumer. A great many people all over the Dominion of Canada have been deprived of a great many things they would normally have purchased, by reason of the restricted production brought about by war conditions. At that time they were told, and it was quite true, that the patriotic thing to do was not to buy, not to consume materials that were urgently needed for winning the great struggle. Now, however, it is patriotic for people to start buying again just as rapidly as they can. Perhaps the very quickest and surest way to get people buying again is to put on a strong advertising campaign. Both manufacturers and retailers are interested in keeping business moving steadily. Intelligent advertising has time after time proved its value in creating a demand for products. It will, if given a chance, do the same thing now.

VALUE OF ASSOCIATION

MANY men, especially younger men, do not always realize the important bearing that choosing their associates has upon their future. Mingling with men who are successful, and who are accomplishing things, is a wonderful stimulus. Association with men who are always bright and optimistic will give one an entirely different outlook on things. The reverse is also true. If men spend their time with those who are not ambitious, they generally turn out the same way. It will make all the difference in any man's career if he keeps close to those whose actions will inspire him, and avoid those whose course in life tends to discourage him.

THE HOUSING SCHEME

REQUEST after request for Government funds to help in relieving the shortage of dwellings is being received by J. A. Ellis, who is directing the work in Ontario. Nearly $5,000,000 has already been asked for by twelve of the smaller cities and towns and requests are now being prepared and will be presented within the next thirty days by fifteen others. Mr. Ellis expects that by June there will be at least fifty or sixty municipalities who will have their housing propositions well under way. General reports that come in from all parts of the country, indicate that a large amount of construction work is under way and that more is constantly developing in spite of the high prices of materials. In some sections a scarcity of brick and lumber has developed, which is retarding construction that would have gone forward. Dealers in builders' supplies report that business has only been fair in comparison with normal conditions, but that it shows, as far as the building situation is concerned, a decided increase over similar periods in the past three years. Details of the provisions of the Ontario Housing Act appeared in the previous issue of SANITARY ENGINEER.

TACT IS NEEDED

WHILE the primary function of the collector is to get the money, the ways and means of doing it must be carefully considered in order that the tree may not be damaged in gathering the crop. There exists between the debtor and creditor a bond of mutual interest and obligation which works to the advantage of both, if faithfully observed and respected. We should insist courteously, kindly, but none the less firmly, not only upon payment of accounts but upon payment when due.

SHORTENING CREDIT TERMS

MANUFACTURERS and wholesalers have found it necessary to shorten credit terms and it seems an assured fact that the future, instead of witnessing a return to previous conditions, will see the tendency to stricter terms more and more accentuated. It has become a positive necessity. The more or less free and easy finance of the days of hectic prosperity will never again be possible.

To the merchant this means only one thing. He must in turn shorten the terms of credit that he allows his customers. It is quite safe to assert that the average merchant is altogether too lenient or too negligent in the matter of collections. He is inclined to let things slide, probably because he is afraid of offending his customers. In every locality there are well-to-do farmers, for instance, with comfortable bank balances who let their bills run on until they seem like the brook which "runs on forever." A few customers like this and the merchant, in order to keep things going, has perhaps to go to the bank for funds. Courteous firmness in the matter of collections is an admirable and necessary quality these days.

YOUR attendance at the convention will prove pleasant and profitable to you and will help to bring about better conditions in the trade. Don't forget, Montreal, June 3-4.

Heating and Ventilating

COMPARATIVE STANDARDS

Second Article of Series Prepared For Readers of the "Sanitary Engineer" by N. A. Kearns

Editor's Note.—This article is the second of a series prepared especially for the readers of SANITARY ENGINEER, covering heating and engineering practice reduced to its simplest terms. The first article of the series appeared in the April 1 issue. Descriptions of installations made in different classes of buildings will be given, together with the method used in making the designs for these installations. It is not our purpose to give complicated formulas, but rather to present the simple rules that have been based on these formulas, in such a way that the reader will be enabled to design a heating and ventilating system without having to refer to the data given in engineer's hand books. The author of these articles, Mr. N. A. Kearns, has designed heating and ventilating equipment for all classes of buildings in practically every province of the Dominion. Some of the buildings were such that the heating and ventilating equipment had to be installed under the most adverse conditions, whereas in other buildings the design for the heating and ventilating equipment was incorporated in the constructional drawings. The third article of the series will appear in the next issue.

If you have ever watched the expert figuring radiation, you have noticed how quickly and accurately he did his work. The secret of his quick, accurate method was a sense of proportion.

That sense of proportion is the natural heritage of some men, with others it comes from experience. And this experience is the result of their own adventures or the result of taking advantage of the knowledge of other men. There is no source from whence the knowledge of other men's methods may be so easily gleaned as the trade paper. Professional men have their journals and they generally spend more time in reading those journals than they do with any other class of literature. When we read a book on heating we are reading a work that in so far as we are concerned is finished, but when we read an article in a trade paper we know that if there is something in that article that is not clear to us, or that appears to be reasoned from wrong premises, we are at liberty to write and find out what the author of the article meant by certain statements, or to set him right if we feel that he may be wrong somewhere.

With the data that we have gathered from the trade journals and other sources of information we are in a position to make our own comparative standards so that we can estimate our work with rapidity and exactness without having recourse to a great many figures. The principle on which comparative standards are set is the same as that principle where you judge the height of a room by comparing the known height of a door with the height of that room. For instance, if you know that a door is seven feet high, and the wall appears to be about three times as high as the door you estimate the wall at 21 feet in height.

In using comparative standards, the faculty of common sense must be exercised. As an example we might say that a room 12 feet square would require just half the amount of radiation of the room 24 feet square, that is, if both rooms had a like proportion of wall and glass surface exposure, but we know from experience that the larger the room the less radiation it takes in proportion to its size.

Again, we might use the comparative standard where we had two buildings of the same class, and we know that one of these buildings required in hot water radiation an area just equal to one twenty-seventh of the heated cube, our standard would then be one twenty-seventh of the cube in figuring for the other building.

If we take one of the smaller modern brick factories with window surface proportioned to the floor area we may find that one of these buildings with 16,000 feet of glass surface requires just 16,000 feet of steam radiation, so that in a building of like character we could make a snap estimate by using the glass area alone as a basis of comparison.

When we once grasp the idea underlying the system of standards of proportion we will not waste much time in going over the same ground twice, and after figuring a certain type of building we should be in possession of enough data to set a standard for other buildings of like type.

Now we are not arguing in favor of the so-called rules of thumb or that the heating engineer can afford to ignore any information that comes to him by way of class-room experiments. Our contention is that he should not be a slave to set rules and that with a grasp of the first principles of the science of heating he should be able to formulate simple standards of proportion that will afford him the necessary information when required.

The man with a clear understanding of mathematics uses fewer figures in his calculations than the man whose education has not gone past the "rule of three."

The intelligent heating engineer does not despise the so-called rules of thumb when he knows that many of these rules are based on sound scientific principles and that they have stood the test of time.

Just what does this rule of thumb mean? I believe that in its original sense it meant a natural measurement, just as a "span" or "hand" meant a fixed proportion, but that in time the term rule of thumb came to signify the rule for guesswork.

Now we will take one of the very accurate rules that is well known to the trade and reduce this to a simple standard of proportion. This is done in the way of suggestion and it is hoped that the reader will try out a similar system in shortening the processes of other formulae as he comes across them in his reading and then using his own figures instead of relying wholly or in part on the set rules of others.

The formula that we are referring to is that where every element is reduced to equivalent glass surface. The heat loss is figured from this equivalent glass surface and the total heat loss divided by the efficiency of the radiating surfaces. Thus, a room twelve feet square with a nine foot ceiling, two exposed walls, and

a window three feet wide by six feet high,

1. We find the cube of this room is 1,296 feet.

2. The exposed wall is 216 square feet.

3. The glass surface is 18 square feet.

4. The efficiency of hot water radiation is 155 B.t.u. per hour.

1a. We divide our cube of 1,296 feet by 55 (this being the factor for proportioning air to glass surface, as discussed in the first article of this series) and find that this gives us a little more than 23 square feet of equivalent glass surface (E.G.S.). We intend to ventilate our room by changing the air twice in one hour, so we wil consider this 23 square feet of E.G.S. in the wall surface.

3a. We add our actual glass surface to the E.G.S. of the cube and of the wall and find that we have a total of E.G.S. made up as follows:

Cubic content	46 feet
Wall	50 sq. ft.
Window	18 sq. ft.
Total	114 sq. ft.

We will assume that we wish to heat the room to 70 degrees above zero when it is ten below outside. This gives us a temperature range of 80 degrees, and as we found from our experiment that the heat loss through one square foot of glass was one B.t.u. per hour per degree difference in the temperatures on the two sides of the glass we will assume that the loss through 114 square feet of glass would be 114 times 80 degrees, which equals 9,120 B.t.u. (You will notice that the 80 degrees in the glass calculation has been changed over to B.t.u. in figuring the heat loss.)

4a. The efficiency of the hot water radiator being set at 155 B.t.u. per hour, we divide the 9,120 B.t.u. loss per hour by 155 and find that there is nearly 59 square feet of hot water radiation required.

The above example illustrates the method of figuring radiation on the basis of heat loss and the efficiency of the radiator. We could take that rule and use it in such a way as to provide for any set of conditions. For instance, if we were figuring against a temperature of 40 degrees below zero outside, we would consider our temperature range as being 110 instead of the 80 as in this example, and if we were figuring for a low pressure steam heating system the efficiency of 255 B.t.u. would be used as a divisor of the total B.t.u. loss instead of the 155. Or again, if the radiating surface was such that it was more or less efficient than these factors of 155 or 255 B.t.u. we could, if we were in possession of the necessary data regarding the efficiency of these radiators use this same rule with the exception of the dividing factor. The conditions might be such that the window surface would be in the form of a double window which would take just above 40 per cent. less radiation than the single window, or it might be in the form of a skylight which takes more. The wall surface might be such that a dividing factor of four used in reducing this wall surface to glass might be too much or too little, and in a later article we will give constants for heat transmission through the various types of construction.

A first reading of the rule just given might lead one to believe that the rule was excessively long and cumbersome, but it has been given in the above form to show just how a rule that apparently calls for a great deal of figuring can be simplified, and to do this we will take the same rule and work out factors that can be used to give the same results as a longer system of calculation.

1b. The room contains 1,296 cubic feet and estimating on two changes of air per hour the cubic space was equivalent to 46 square feet of glass surface. Multiplying this 46 square feet by the temperature range of 80 and dividing by the efficiency of the radiators, viz.:

1b. 155 we found that we require 23.7 square feet to heat 2,592 cubic feet of air 80 degrees in one hour, so we divide that 2,592 by 23.7 and find that every 109 cub. ft. of air under this condition requires one square foot of radiation.

2b. We take our wall surface of 198 square feet and using the same system of figuring as given in our first example we find that the 198 square feet of wall surface requires nearly 26 square feet of heating surface, or that there is one square foot of radiator surface required for every 7.6 square feet of wall surface.

3b. In the same way we find that our 18 square feet of glass requires about 9 square feet of radiator surface or one square foot to every 2 feet of glass.

Now we have the simple standard of proportion, for a condition as follows:

Hot water heating at 70 degrees inside temperature against 10 degrees below outside and the efficiency of the radiator at 155 B.t.u. per hour.

First, divide cubic contents by 109, multiplying our answer by as many times as we wish to change the air.

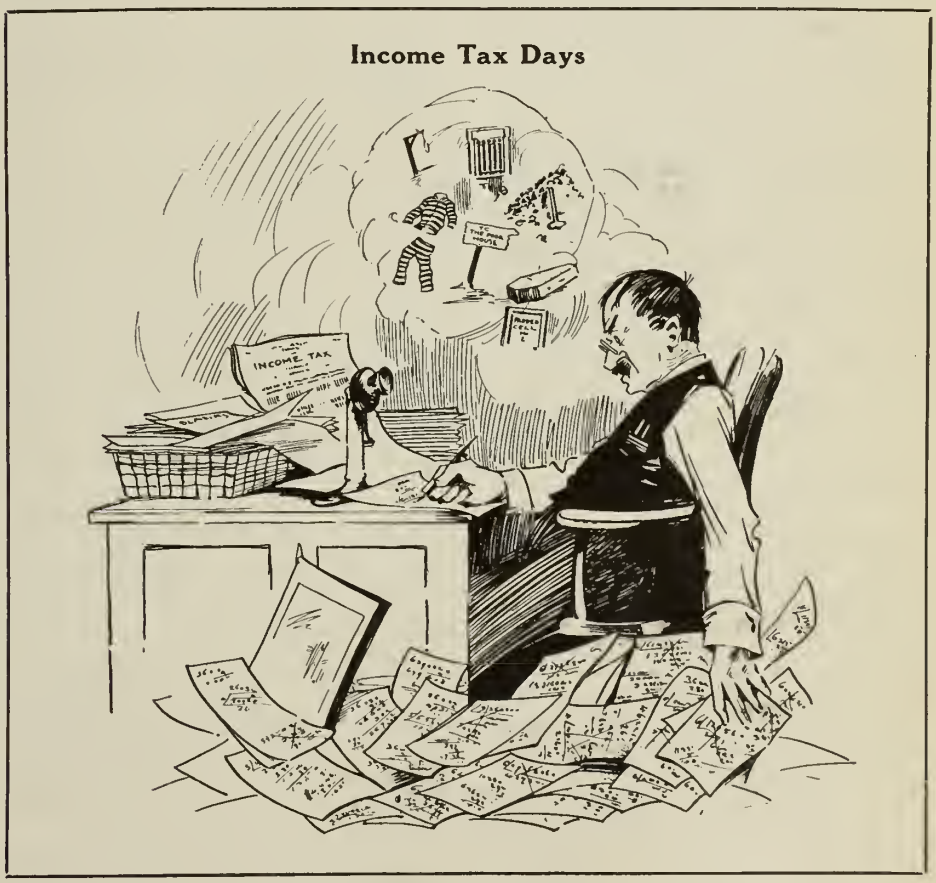
Second, divide wall surface by 7.6.

Third, divide glass surface by 2.

Fourth, add the answers that you have obtained from operation Nos. 1, 2 and 3 and you have the amount of radiating surface required.

Now if the owner of the building decided to use steam instead of hot water it would not be necessary to go over all of the figures of glass surface, cubic contents, etc. All that would be necessary would be to use the comparative standard of the efficiency of a hot water radiator to steam, and reduce the hot water radiation in proportion.

Now it is the usual practice to consider a cast iron steam radiator as having an efficiency of 255 B.t.u. per hour (the American Society of Mechanical Engineers rate them at 244 B.t.u., but for our examples we will consider the efficiency as 255. If we divide 9,120 by 255 we find that our answer is 35.8 square feet, or just about 60 per cent. of the 59 feet we figured for the hot water radiator. So you will see from the above it will be a very easy matter for us to figure our radiation by the rule for hot water and then take 60 per cent. of this for steam, but perhaps we would prefer to figure directly for steam, so



The Head of the Firm "Hell—p"

we make our standards for steam in this way:

It takes 40 per cent. less radiation for steam than for hot water, therefore our dividing factors for the cubic contents, the wall surface and the glass should be such that we will get 40 per cent. less radiation than with the hot water system. In taking our cubic contents first we found that, when we divided 2,592 by 109, 23.7 was the amount of radiation required. Now for steam we want just about 60 per cent. of that 23.7, or in other words a little more than 14 square feet, and 14 square feet is the answer we get when dividing 2,592 by 185, or 70 per cent. more than our divisor for water, so we add 70 per cent. additional to all our factors used in water heating and have a comparative standard for steam as these two tables show:

	Hot Water	Steam
Cubic content	109	185
Wall	7.6	13
Glass	2	3

Now the two rules here given, one for hot water and one for steam, may not be as easily remembered as the rule where we divide the cubic contents by 200, the wall surface by 20 and the glass surface by 2 in figuring for steam radiation. In many cases you would find that the rule of 200, 20 and 2 would give you exactly the same answer as the rule herein given although for a room of the size and proportions used in our example the 200, 20 and 2 rule would call for more radiation than this rule that we have formulated from the heat loss. You will note that a greater divisor is used for the cubic contents in the 200 rule than in the heat loss rule, but that the divisor for the glass surface is considerably less, so that in a room with a great deal of glass area you would find by using the 200, 20 and 2 rule, a larger proportion of radiating surface to glass area than you would have found by using the heat loss method.

It was the intention to describe in this article some types of heating apparatus, but we have already taken up more than our allotted space in this issue and must leave those descriptions for a later number.

(To be continued)

VENTILATING THE MODERN SCHOOL

Second Article of Series Written Especially For "Sanitary Engineer" by N. A. Kearns—First Article of Series Appeared in April 1 Issue

BEFORE we take up the matter of apparatus used in the ventilation of school buildings, it might be well for us to have a little discussion on why we should provide any means at all for ventilating a school building.

It is not so very many years ago that ventilating systems had almost to be forced on many school boards. I can well remember the chairman of the building committee on a certain school board in Western Canada stating that he was against having money spent on a ventilating system. He remarked that he had got on very well without it and that he stood ready to "lick his weight in wild cats" and was sixty years of age. He went on to tell us how as a boy he had walked several miles to and from school each day, and how during the winter he had cut wood between school and bed time. It developed that the proportion of time he had spent in the school room was very low when compared with the time he had spent in vigorous outdoor exercise. He argued against installing a ventilating system in the school, but when he quoted his own personal experience, he, without intending to do so, gave a strong argument in favor of providing some means of providing an adequate supply of fresh air to the children that spent so many hours confined to a school room. When this was pointed out to him he saw the strength of the argument for the ventilating system and gave his support to the men who were advocating the installation.

Ventilating systems have two functions; one of these is to aerate the blood of the occupant of the room and the other to absorb the excess animal heat.

As a rule ventilating systems are installed as a separate unit of the heating systems; but in some cases they are arranged as a part of the heating system.

Examples of both systems will be given in articles following this.

In proportioning the amount of fresh air to a class room it is the general custom to use the amount of carbon dioxide in the air as standard. Carbon dioxide is indicated by the sign CO_2 and as outside air contains 3 to 5 parts of CO_2 in 10,000 parts of air we assume that in our ventilating systems we should not allow the proportion of CO_2 to rise above ten parts in 10,000 and for the best results 6 to 7 parts in 10,000 should be the limit.

If we take the outside air in from an unpolluted source and deliver it in the proportions of 30 cubic feet of air per pupil it is not likely that the proportion of carbon dioxide will rise before the proportions given.

Some of the systems we intend to describe are so installed that, when working properly, a direct displacement of the foul air takes place. Most ventilating systems are so installed that the principle worked on is that of the dilution of the air to the point of relative purity.

In a "direct displacement" system more heat is lost from the building in the operation of the ventilating system than is the case with the "dilution" system. But with the "dilution" system more air must be supplied than with the "direct displacement."

We will first take up "gravity" systems of ventilation when used in combination with steam or water systems.

The first system that we will mention is that known as the "cloth window." In this there are no fresh air flues supplied. Foul air extraction flues are provided and set on the inside walls opposite to the window. The vent faces are set in these flues 3 feet from the floor line and these vent faces have a free area of about 5 feet square for a class room containing 40 pupils. The foul air flues are fitted with "back draft" dampers so that a "blow down" in these flues cannot occur. The flues also have dampers that may be closed when classes are not in session.

The radiators are placed under the windows.

The lower sash is pushed up and its place taken by a sash covered with factory cotton, in the proportion of one square foot per pupil. This system has been used in a number of schools in the United States and the report is that it gives general satisfaction. The writer has had no personal experience with it and is therefore not in a position to make any recommendation.

The second system that we will refer to is that of the "direct-indirect." In this system of ventilation the foul air extraction flues are arranged in a similar manner to those in the "cloth window" system.

A few of the radiators in the room are of the direct-indirect type. Direct-indirect radiators do not differ from the ordinary type, but are placed on special bases that are provided with an opening in their side or at the bottom for the admission of fresh air from the outside. The cold air coming from the outside is heated in passing over these radiators and passes into the room.

With the direct-indirect system a practical displacement of foul air takes place.

The third system to which we will refer is the "indirect." In this system there is a fresh air flue leading to the room as well as the foul air flue leading therefrom.

Each fresh air flue leads from an air tempering chamber at its base. There are set up in that chamber certain cast iron radiators or tempering coils that heat the cold fresh air coming from outside. Each fresh air flue is fitted with a "mixing" damper so that if the air becomes too warm the damper may be set to allow a certain amount of cold air to enter the stack and cool it.

The fresh air escapes into the class room through a fresh face set at about 8 feet from the floor line.

The foul air escapes to the vent flue through an opening or openings at the floor line.

The next system that we will refer to is the so-called "plenum" or pressure system. In this system the air for ventilation is heated in a central chamber and is driven through channels of brick

or galvanized iron to the upright flues leading to the different class rooms. The fresh air enters these class rooms and is extracted from them in the same manner.

Any of the above mentioned installations may also have in addition to the equipment described exhaust fans for removing the foul air. In the absence of a pressure fan and with the use of the exhaust fan the systems are then known as vacuum ventilating systems.

The next system of ventilation described is one where the ventilation system is also used for heating. This is known as the "hot blast system."

First the cold outside air is drawn into a primary heating chamber where it is heated to a temperature of 50 to 60 degrees Fah. It is then driven by a fan through a system of ducts to the radiator enclosures under the windows and in passing around these radiators it becomes heated before it is driven up in front of the windows.

There is also an arrangement of damper with this system so that the temperature of the incoming fresh air can be controlled by the adjustment of the mixing dampers at the base of the radiators.

The foul air may be exhausted from the room through flues situated in the wall opposite to these radiators; but in so far as the heating effect may be concerned it is much better to exhaust it through openings in the floor line or the same side of the rooms as the radiators may be placed.

The following are a few recommendations:

1. Fans should be large enough to run at a low speed, so that the noise of the fan will be reduced to a minimum. The fan should be placed on a well insulated base and its outlet connected to the galvanized iron trunks, if any are used, by means of a flexible canvas connection.

2. The fresh air ducts should be such that they can be easily inspected and kept clean. The cold air should be taken at a point above the dust line.

3. Indirect heater stacks should be set high enough above the water level of the boiler so that there will be no danger of their filling with water. Every return from these radiators should be so valved that they may be valve. The greatest care must be exercised to see that every section is properly vented.

If the sections are placed in series, the first stack exposed to the cold incoming air should not have a valve on the feed. Provision should be made for draining these radiators and returns when they are not in use, and they should be so valved that they mey be used either in conjunction with the heating system or as a separate unit.

REMODEL LONDON SCHOOL

In order to enlarge the lavatories and heating plant and to provide larger playroom space, the London City Council is going to remodel the basement of Central School.

SEES BUSY SEASON AHEAD

Montreal Manager Gives Views Regarding the Future Outlook —Labor a Big Question

Based on an interview by "Sanitary Engineer" representative with C. F. Smallpiece, Montreal manager Taylor-Forbes Company

C. F. SMALLPIECE, Montreal manager of the Taylor-Forbes Company, believes that the present year will witness a great deal of building. To a representative of SANITARY ENGINEER, Mr. Smallpiece stated his reasons for holding this view.

In the first place prices have declined considerably on radiators, valves, pipe and fittings. True, these have not declined to the extent that some would like, but it is very obvious, Mr. Smallpiece said, that they will not reach anything like the levels prevailing before the war. In fact it would be safe to say, "never again," he believed, in the matter of material costs.

Labor a Big Question

Labor has been one of the big questions and is even more so to-day. Men who have been receiving moderate wages in previous times are getting much more to-day, and they will continue to get a high return for their services. Food prices demand that they be well paid. The social status has been raised, and Mr. Smallpiece pointed out that this change for the better was going to be permanent, in his opinion. "Just as the man who received $5,000 for his year's work before the war, and who is now receiving $7,000 will expect this salary to be paid him on the higher basis still, just in the same manner will the man in the shop who has had a proportionate advance expect to still receive the higher wage. He must get more money than he did, as a matter of fact, for his living, and food in particular, is costing him more, and will cost him more."

Continuing, Mr. Smallpiece stated that, while material in the mine would cost no more than it did before, it would cost just so much more as the higher range of wages added to it. Certain he was that the masses must change their viewpoint regarding the cost of a given article.

Peace and Prices

"People must remember that we are living under different conditions and in a different age," was Mr. Smallpiece's way of justifying his idea that a new plane had been reached. It is not fair for one to assume that the world will return to the place it occupied in 1913. It cannot be. Therefore, and the sooner the better, the new order which has been evolved and which must be established calls for a sane, definite, and progressive policy. That this will develop rapidly and that conditions from a building standpoint will be vastly better, Mr. Smallpiece has no doubt.

One of the important bearings at this time is that of the peace settlement which the world nations will be able to make. It may be that a return of building will not come until terms are actually signed, but the change is due, and once a settlement is arrived at, Mr. Smallpiece thinks a large amount of actual work will be laid down.

In the first place, people need, and must have housing. They will, he thinks, come to realize how far away low prices are. This view of the new order of things will come to them gradually and in addition to the need for suitable apartments and houses, there is a great deal of capital which will seek investment. The housing scheme will appeal favorably to those who have piled up profits from war work, and this investment will be a good one.

Then again, money rates are high. In this part of the country where term loans could be had before the war at from 4½ to 5½ per cent., the charge now is nearer 7 to 7½ per cent, and this is likely to remain, thinks Mr. Smallpiece. If it does, there is reason to expect an opening up by those having funds for investment. Altogether, it ought to be a good season, and the start ought soon to be made.

STRIKE INSURANCE NOW BEING ISSUED

A form of insurance designed to protect employers from losses occasioned by labor troubles is to be dealth with by a newly organized company chartered in the State of Maryland, says the Insurance Press, which will provide indemnity covering monetary loss sustained by reason of strikes, computed on the amount of the annual fixed charges during the period of complete or partial idleness.

The company will provide a service for the benefit of both employers and employees and will take a neutral position on the question at issue. It will aim to keep the scales balanced as evenly as possible between the two parties. Many manufacturers have now more to fear from strike losses than from conflagration, it is stated.

MAYOR STATES TORONTO SEWERS INADEQUATE

Mayor T. L. Church of Toronto, speaking of the Bill now before the Ontario Legislature to incorporate the Township of York and to provide sewage disposal of the new municipality through the sewers of the city of Toronto, stated that Toronto's sewage disposal system is not adequate or satisfactory, and that the addition of the sewage from the county would do anything but make matters better, and already Toronto's sewage disposal system is before the courts.

Mayor Church takes the view that the taxpayers of Toronto have enough problems of their own without paying to solve York County's. He doubts the Act's legality.

Labor Cost Plumber's Present Problem

Montreal Plumber Thinks This One of Biggest Questions To-day—Plenty of Men, But Wages High—Workmen More Efficient and Can Earn More—Social Reform Should Have National Attention

Based on an interview by "Sanitary Engineer" representative with J. P. Linton, assistant manager of the Garth Company, Montreal

"ONE of the biggest problems which the plumber has to face to-day, is that of labor, with its demand for higher wages." This is the feeling of J. P. Linton, assistant manager of the Garth Company, Montreal, steamfitters and plumbers.

Mr. Linton pointed out that there was less difficulty in securing good men than there was, but there was no relief in the matter of the wages demanded, and this was partly due to the fact that a great many of the larger railway and other companies were still offering tempting rates to the better men. "One large company is paying some of their men 68c per hour right now," said Mr. Linton. "This makes it necessary for us to pay as much or nearly so."

But the great impediment encountered is that of more or less dissatisfaction, even when the higher wages are paid. Mr. Linton said that, no matter what wages a man was getting—even when they were twice as high as before the war, there was a certain discontent that bordered on unreasonableness. Thus many assumed that, because the manager of a business or someone higher up than they received a larger salary, they also ought to get still more. They never made allowances for the fact that the management had to direct the business and that he had many problems to solve of which they knew nothing. An unfortunate spirit of discontent seemed to linger with a large number of men.

Conditions are Good

Asked as to the condition of business and for his views regarding the outlook in general, Mr. Linton expressed himself as well satisfied. "We have had our men busy right along and have not discharged any," he said. "In addition to this our mechanical department is very busy and we have been figuring on a great deal of proposed work, and this is one of the best indications, for if plans are being submitted for the trade to figure on, it means that they are seriously considering actual building." The omen is a good one.

It was pointed out that a great deal of work was developing from outside, even to a greater extent than within the city. Some large buildings are about to be erected in different parts of the country, and these will, in many instances, call for a superior line of plumbing, heating, vacuum systems, and sprinkler protection against fire. It was evident, Mr. Linton thought, that there would be a great deal of activity this year.

A National Problem

It is significant that Mr. Linton touched upon a point which was also emphasized in another quarter on the same day, and which indicates that employers have a new vision. This was concerning the change in social status which has come about or which is fast developing. Briefly, it consists in the fact that many workers are now living better than they were, not only from the standpoint of better food, but also that of better housing. There was a well-defined desire, Mr. Linton thought, on the part of the average workman to live in a better house and to enjoy in this way many comforts that were not his before. This was as it should be. Better to have a contented class of citizens who were living in real houses than to have unrest perpetuated by continuing the old order, under which many lived in hovels, or little better than hovels.

This matter ought to have the atten-

THE WATCH ON THE RHINE

The photo shows the famous Hohenzollern Bridge, over which the Canadians, with other Allied troops, crossed the Rhine and took up positions on German territory. One of the Rhine motor launch patrols is also shown. Both the bridge and the river are closely watched and guarded by the Allies.

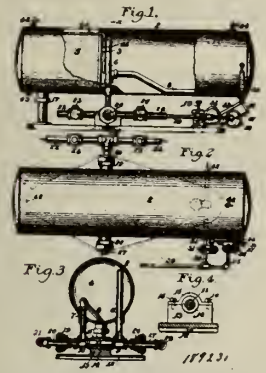
New Canadian Patents

NO. 189,231. STEAM TRAP

Frederick C. Farnsworth, assignee of John F. Nelson, both of Conshohocken, Pennsylvania, U.S.A., 25th March, 1919; 6 years. Filed 30th September, 1918. Receipt No. 299,887.

Claim—1. In a trap of the character stated the combination of a base having a bearing formed thereon, a tilting trap body having downwardly extending pipes opening from interior thereof, said pipes at their lower ends having oppositely directed branching portions in the same transverse alignment and unobstructed at all times, and a journal portion secured between the lower

No. 189,231. Steam Trap.



ends of the two pipes and their branching portions and in alignment with said branching portions and providing a seal between them, said journal portion seated in and adapted to oscillate upon the bearing of the bed plate, said journal portion forming a permanently sealed union between the two pipes and their branching portions, and in which further the pipes and their branching portions provide hubs at ends of the journal portion to position it upon the bearing.

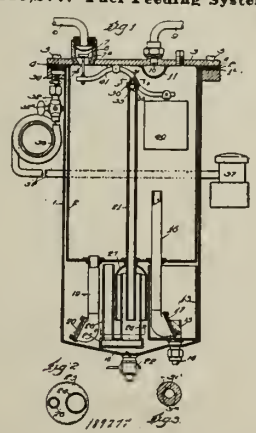
Claims allowed, 8.

NO. 189,235. HEATING MECHANISM

David Wiley Anderson, Scottsville, and Archibald Douglas Dabney, Charlottesville, co-inventors, both in Virginia, U.S.A., 25th March, 1916; 6 years. Filed 2nd December, 1918. Receipt No. 302,130.

Claim—1. An automatic heat regulating and fuel saving attachment for heaters of various kinds, comprising a main air draft chamber, a regulating air draft chamber, a partition positioned between said chambers provided with an opening therethrough, an automatically operated damper loosely suspended within said regulating chamber adapted to control the passage of air through said opening, means for controlling the

No. 189,277. Fuel Feeding System



admission of air to the main air draft chamber, a removable cap secured to the outer end of the regulating chamber, means secured to said cap for regulating the admission of air into the last-named chamber, and a flanged portion adapted to be secured to a heater formed with an opening therethrough for the discharge of air from the main air draft chamber to the fire portion.

Claims allowed, 17.

NO. 189,277. FUEL FEEDING DEVICE

William H. Muzzy, Chicago, Illinois, U.S.A., 25th March, 1919; 6 years. Filed 18th November, 1918. Receipt No. 301,639.

Claim.—1. In a device in which liquid is alternately lifted from a lower source into a higher chamber by suction, and discharged therefrom upon relief of the suction, the method of timing the alteration of suction and relief therefrom which consists in producing a circulation of liquid in a path which returns upon itself, in which path is located an air intake through which the suction in said chamber is relieved, and which is sealed by the liquid returning in said path to the location therein of said intake.

2. In a liquid feeding system in which the liquid is lifted by suction from a lower source to a higher vacuum chamber and delivered from the vacuum chamber upon relief of the suction therein, the combination with the vacuum chamber, of devices for governing the suction and relief thereof to cause the suction and relief to recur in definite cycles independently of the quantity of liquor lifted or the quantity delivered.

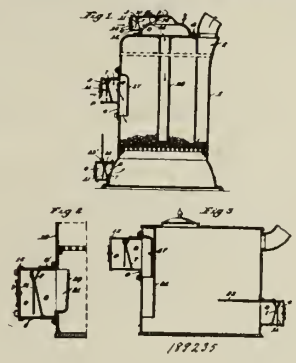
Claims allowed, 21.

NO. 189,279. VALVE FOR FLUSHING TANKS.

Thomas J. McCaffrey, Seattle, Washington, U.S.A., 25th March, 1916; 6 years. Filed 24th December, 1918. Receipt No. 303,080.

Claim.—1. A flushing siphon having an inlet leg and a chamber operatively connected to the inlet leg of the siphon, the inner wall of the inlet leg extending below the top of the chamber and the

No. 189,235. Heating Mechanism.



outer wall of the inlet leg terminating at the top of the chamber, a stem movable vertically through said chamber and extending straight upward for its entire extent, and a lifter plate loosely mounted on the stem for vertical movement upward independent of the stem for the entire length of said chamber, to thereoy pass the lower end of the inner wall of the inlet leg, the stem having independent movement downward relative to the lifter plate and having a stop on its lower end upon which the lifter plate normally rests.

Claims allowed, 2.

NO. 189,302. HEAT DISTRIBUTING DEVICE.

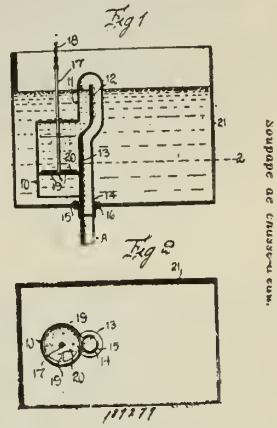
Frank W. Stevens, Albion, Iowa, U.S.A., 25th March, 1919; 6 years. Filed 13th November, 1918. Receipt No. 301,408.

Claim. 1. A heat distributing device comprising a floor formed with a hole, a furnace casing communicating with said hole, a partition formed with a hole above and communicating with the hole in the floor, a templet of triangular shape mounted in the upper portion of the latter hole and having deflecting walls overhanging the hole in the floor, a register overlying the hole in the floor, said templet being formed with a longitudinally extending slot over the hole in the floor, and a damper extending through the slot in the templet and adapted to be moved across said register.

2. A heat distributing device comprising a floor formed with a hole, a furnace casing communicating with said hole, a partition formed with a hole above and communicating with the hole in the floor, the sides of the hole in the partition being lined with brick and formed with facings of mantel and plinth on either side of the partition, a templet of triangular shape mounted in the upper portion of the latter hole, and a damper projecting within and extending downwardly from said templet and adapted to be moved across the register.

Claims allowed, 2.

No. 189,279. Valve for Flushing Tanks.



NO. 189,303. DOMESTIC HEATING SYSTEM.

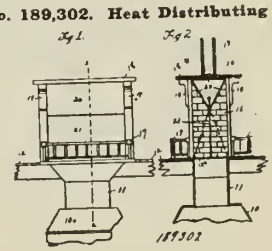
Alfred H. Thompson, Venice, California, U.S.A., 25th March, 1919; 6 years. Filed 10th September, 1918. Receipt No. 299,198.

Claim.—1. In a domestic heating system, the combination of a hot water circuit including a distributor, a domestic tank, and a heater, the distributor, a domestic tank, and a heater, the distributor being situated substantially above the level of the domestic tank, and the domestic tank being situated substantially above the heater, a radiator, a pipe communicating with the hot water circuit near the upper part of the domestic tank, said pipe leading to said radiator, a pipe leading from said radiator and communicating with the lower portion of said water circuit.

3. In a domestic heating system, the combination of a water circuit including a distributor, a domestic tank, and a heater, the distributor being situated substantially above the level of the domestic tank, and the domestic tank being situated suostant.al.y above the level of the heater, a radiator, a pipe communicating with the water circuit above the tank and leading to said radiator, a pipe communicating with the lower portion of said water circuit and also leading to said radiator, a valve in one of said pipes leading to said radiator, a valve in the water circuit, service cocks, a pipe communicating with the upper portion of said water circuit and leading to said service cocks, and a supply pipe for the system.

Claims allowed, 6.

No. 189,302. Heat Distributing Device.



NO. 189,304. HEATING SYSTEM.

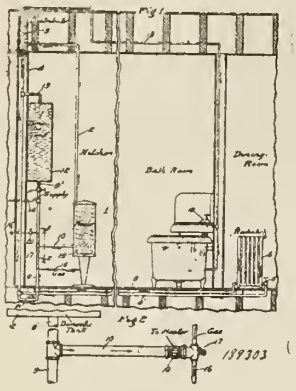
Alfred H. Thompson, Venice, California, U.S.A., 25th March, 1919; 6 years. Filed 13th November, 1918. Receipt No. 301,443.

Claim.—1. In a combined hot water domestic and heating system the combination of a hot water circuit including a closed distributor of substantial capacity, a heater and a radiator, the distributor being situated above the level of the heater, a service cock, a pipe leading from the top of said distributor to said service cock, and a supply pipe for the system, said supply pipe being adapted to produce pressure in the distributor and said distributor forming an enlarged chamber of substantial capacity capable of accommodating any accumulation of air or steam likely to occur in the system under the pressure of the water supply, and to prevent such accumulation of air

or steam from reaching the circuit and thus stopping the circulation of water through the heating system, the pressure in said distributor operating to force the water through said service cock.

Claims allowed, 5.

No. 189,303. Heating System.



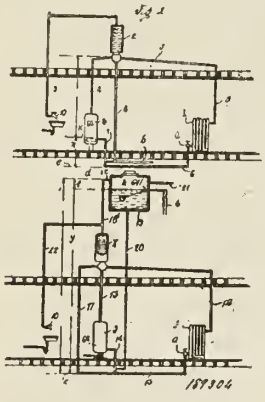
NO. 186,306. STOVE SPARK ARRESTER. Emil Zimmerman, Butternut, Wisconsin, U.S.A.. 25th March, 1919; 6 years. Filed 4th November, 1918. Receipt No. 301,094.

Claim.—1. A spark arrester comprising a rotatable rod, and a plurality of arcuate rods carried by the said rotatable rod and arranged to comprise two series of rods, one disposed above the other.

3. A spark arrester comprising a rotatable rod, a circular ring carried by the rod and adapted to be rotated therewith, two series of arcuate rods having their terminals fastened to the ring, and a supporting rod for each series of rods.

5. A spark arrester comprising a rotatable rod having a handle formed at one end thereof, a ring supported by the rod and adapted to be rotated thereby, a series of rods of arcuate formation having their terminals fixed to the said ring, and a second series of rods of arcuate formation having their terminals fixed to the said ring, the arc of the second series of rods being greater than the arc of the said first series, the rods of each series extending across the ring in equally spaced relation to each other, the rods in the said second

No. 189,304. Heating System.



series being disposed above the centre of the space between the rods in the lower series, and a supporting rod for each series of rods.

Claims allowed, 5.

KINGSTON LOSES SANITARY INSPECTOR

Nicholas Timmerman, for the past three years garbage and sanitary inspector of Kingston, Ontario, has handed in his resignation to the City Council. Mr. Timmerman, who is resigning on account of ill health, is a native of Holland. He came to America in 1873, and after a few years in Buffalo moved to Kingston, where he served the city continuously for thirty-three years, thirty years on the police force and latterly the sanitary inspector service.

CONVENTION REPORT

Continued from page 25

Letter from C. Clapperton

Mr. G. E. Frankland, Secretary,
Ontario Society of Domestic and Sanitary Heating Engineers, College St., City.

Dear Sir:—Replying to yours of March 29th, and as directed by our President, Mr. F. R. Maxwell, the writer hoped that he would have the opportunity of addressing the meeting on Friday in regard to the apprenticeship problem, but owing to other arrangements may not be able to do so, and begs to submit the following suggestions to our president which he can bring before the meeting if he so desires.

Mr. Maxwell in commenting on the apprenticeship question thought it would be well if five members were appointed throughout the province, these to meet at stated times. The writer thinks this would be a good idea, but feels that probably better results might be obtained if we could get from the different towns and cities suggestions on the said question, so that when the Toronto Committee present their findings to the Toronto Society they will be able to present something that might be not only of interest to Ontario at large, but a system that might be suitable for all.

Your Toronto Committee are giving the question a good deal of thought, and hope to present to the Association at their May meeting a system that would be workable, and in any case food for discussion. We are strongly of the opinion that every member of our Association should do his part in trying to teach boys not only to be mechanics, but to be of good moral standing, and to have a technical knowledge of the business when they strike out for themselves.

Our country is of large area, and sparsely inhabited at the present time, but we are confident that the future holds great possibilities for the population to increase rapidly, and the rapidly growing towns and villages will have to depend on the mechanics from the city. We feel that in the City of Toronto we require from 15 to 20 full-fledged mechanics each year to take care of the wastage.

Our recommendation will further recommend a course of technical training. We are taking this question up with the principal of the Technical School as to the best course of procedure along this line. We also intend taking the question up with the Jonrneymen's Association, so that we will have their co-operation and assistance in our endeavors to give the boys every opportunity to know our business thoroughly.

We would like very much to interest all the Ontario members and have written suggestions from each centre if this could be arranged.

You have further asked for any suggestions as to the further operations of the Society in regard to organizing of the craft. We believe there are only two ways this can be done, that is by propaganda, or by sending an organizer through the district. The writer believes the propaganda should be tried before we go to the expense of sending an organizer out.

Wishing you every success in your deliberations on Friday, I remain,

Yours truly,
G. CLAPPERTON.

The Sanitary Engineer His Wants and How They Are Supplied

Report by Henry E. White, Brantford, Ont., chairman of Apprenticeship Committee, before meeting of Ontario Society of Domestic, Sanitary and Heating Engineers.

WHAT are the wants of the sanitary engineer? What conditions does he need to have fulfilled so that he can conduct his business in a proper manner, and thereby make a living for himself and family, and incidentally help the community in which he lives?

These wants may be roughly divided under three headings:—

First.—Opportunity to work, sell material and labor.

Second.—Opportunity to buy the goods he needs.

Thirdly.—Opportunity to obtain the labor necessary to install the goods when sold.

Let us now take these under separate headlines and see what is to be done in reference to them.

Opportunity to Work

Opportunity to work, for a profit, for bare wages or a loss. That is largely determined by the methods of the man himself, if he is one of those who thinks chiefly of getting the job he will have lots of the latter. All the work in this old world is not yet done, neither are all the deadbeats extinct, in any event if he is any good at all as a workman he will have lots of opportunities figuring on work which if he is lucky will only get a small percentage of.

Goods or Merchandise

If he is fortunate enough to be possessed of a little ready cash the road to buying is easy enough, and the ever ready supply man soon has him loaded up to the limit, he may even get some credit if he looks good enough. As to his disposal of the goods at a profit that largely depends upon whether he uses judgment in buying them, or whether he lets the salesman wish them on to him.

Whether he recognizes it or not right here is the point where he has got to round out his business policy or go broke. Every dollar's worth of goods he buys carries its corresponding amount of labor for the ultimate delivery of the goods before he can even look to see whether he has got a strangle hold on that very elusive thing called **profit**, so that it can be fairly assumed as a maxim of the trade that a merchant in the sanitary engineering business must employ help in a proportionate number to the quantity of goods he buys.

Now the average merchant prides himself not a little on his buying ability, he follows the market reports, he balances up his stock, he endeavors to shift the shop-worn goods off the shelves. To keep things moving he will plan ahead and generally handle his material in a business-like way by turning the dollar just as often as possible.

Now if the employer would give the same attention to his labor problem as he does his merchandise, handle them ahead of time, provide for the future as he should, we would not hear so much about the shortage of skilled help. The fact that he has not been doing this seems to imply that there must be reasons for this omission, and to remedy this trouble we must first find the cause.

Some of the causes for lack of apprentices to the trade are suggested as follows:

A natural dislike of the present-day youth to be bound to any employer.

The opportunity in the last few years to make abnormal wages at other employment.

A want of concerted action on the part of employers in handling the question.

The opposition of the general public to the apprentice being used on their particular job.

The present high standard of efficiency which all good merchants aim at, and which is absolutely necessary for the success of the business, which works automatically against the inclusion of any person who is unable to carry on alone.

The high cost of materials, which entail more losses when handled by other than efficient workmen.

LACK OF AIR

Question—I have a hot water furnace in my house and have had it for about four years. Last winter I began to have trouble with it from the first of the season. Every winter before that it gave excellent service. My house was always warm and I have recommended the boiler to a number of my friends. They now have the laugh on me. Any time any of my friends come in I am sitting in front of the kitchen stove trying to keep warm. It is most exasperating. I have had a couple of men in here from the people that installed it and they said it was my chimney. I cannot see how that could be the cause as the chimney was allright from the first. I have had the chimney cleaned and a new smoke-pipe put on the furnace. There is nothing wrong with the chimney. The damper is not stuck in the smoke-pipe and the smoke-pipe fits tight into the thimble in the chimney and on to the furnace. If I leave the feed door open on the furnace the fire burns better than when the feed door is closed, sometimes the fire goes right out with all the drafts open. The fuel will not even smoke but just goes out. I know it is not the coal, as a neighbor of mine is using the same coal in his boiler and getting good results.

Answer—From the description of your trouble it would appear that the fire does not burn in your boiler because of the lack of air necessary for proper combustion. It is likely that last spring some ashes were left on the grates, these ashes became damp and hardened between the teeth of the grates, so that no matter how much shaking you gave the grates the hard ash would not dislodge. You should have a man clean out the hard ash from between the grates with a file, and if you have any trouble in getting the fire to burn properly after this let us know.—Ed.

THROWS OFF 966 B. T. U.

Question—I have read that it takes one heat unit to raise one pound of water one degree and a pound of water condensed from steam evaporated at a temperature of 212 degrees gives off 966 heat units. I cannot see how this can be right, for if the temperature of the steam is only 212 degrees and there is a pound of water in that steam there cannot be more than 180 B. T. U.

Answer—When one pound of water in an open vessel over an open fire reaches the boiling temperature it does not increase any more in temperature, but begins to change to steam. It takes just 966 heat units to change that pound of water to steam and the steam in changing back to water throws off that 966 B. T. U. before it starts to cool.—Ed.

THE SANITARY ENGINEER

(Continued from page 38)

The strictly business proposition of whether the work is done in less time when there is an apprentice on the job or not?

We have been used in the past days, that is, in pre-war times, to having our workmen come along without much effort, selling his labor as best he might, like the salesman from the supply house sold his goods and we got good and bad articles from them both: that time seems to be past. It is not in the interests of the journeyman to perpetuate his race, at least he does not think so, he imagines he has more to gain by keeping out the apprentice. Is it good business on our part to go on building up the one part of our business and giving no attention to the other? Personally I would think not. Let us get together on this work and if we decide apprentices are needed let us get after them the same as we would any other part of the business, with a regular, well-defined plan of action common to us all.

In conclusion I would ask you to consider closely the bulletin issued by the Industrial Commission of Wisconsin on the apprenticeship System and reprinted in THE SANITARY ENGINEER of March 15th, which contains many valuable suggestions, including the following:—

The Apprenticeship Plan

A solution to apprenticeship cannot come where either one or the other side of the trade assumes exclusive control. Apprenticeship controlled entirely by the employees, or the union, is bound to meet with dissatisfaction on the part of the employers, if not of the boys. On the other hand, apprenticeship controlled entirely by the employers without regard to the rights of journeymen in the trade is likewise sure to bring unsatisfactory experience. This has been borne out in the past, and the twenty years of discussion in trade associations in the plumbing business have revealed the decline of proper apprenticeship in the trade, and have also brought to light the troubles which arose when either the union or the employers attempt alone to govern apprenticeship. Effective administration of apprenticeship must come through joint control and is best assured when the state takes a hand and administers the regulations with the interest of the public at heart. This interest is chiefly in the welfare of the apprentice who is to be the future tradesman.

FINANCIAL STATEMENT OF THE ONTARIO SOCIETY OF DOMESTIC SANITARY AND HEATING ENGINEERS FOR 1918.

Year ending January 31st, 1919

1918	Receipts		
Feb. 1	By Bank Balance..	$695.08	
	By Dues Rec. from secretary	605.00	
			$1,300.08
1918	Disbursements.		
Feb. 1	To Annual Government Fee	$ 1.00	
April 5	To G. F. Frankland, expenses	25.50	
June 29	To E. H. Russell, Endowment Fund Loan	125.00	
June 29	T. G. F. Frankland, in trust, special loan	160.00	
July 11	to G. F. Frankland, expenses	25.00	
Nov. 16	To Can. Society, per Capita, 1918.....	100.00	
Nov. 16	To Finance Minister of Canada, bond...	500.00	
1919			
Jan. 31	To G. F. Frankland, expenses	10.00	
	Total disbursements.....		$ 946.50
1919			
Jan. 31	Balance in Bank.....		$ 353.58
			$1,300 08

ASSETS ON HAND
January 31st, 1919.

Office Furniture, Charts, Records, Stationery and books.....	$	100.00
One Five Hundred Dollar Dominion of Canada Victory Loan, 1918 bond		500.00
Bank balance		353.58
Total amount	$	953.58

The firm of Duhamel&Fils, plumbers, has been registered in Montreal by Jos. Duhamel.

News from Here and There

CONTRIBUTIONS OF NEWS GLADLY ACCEPTED

QUEBEC PROVINCE GOSSIP

E. G. Brousseau and Frere, St. Joseph Street, Quebec, are engaged in installing the heating, plumbing, and vacuum work in the new St. Patrick's School. This is an extensive piece of work and will take months to complete, the contract, it is understood, running to nearly $35,000.

John R. Meadowcroft, manager of the Garth Company, Montreal, will have the sympathy of his many friends in the loss of his mother, widow of the late Thomas Meadowcroft, and who died in Montreal on March 24.

E. C. Townsend, manager of Crane, Limited, Montreal, has returned from England, where he spent several weeks on special business.

John R. Meadowcroft, manager of the Garth Co., Montreal, has been convalescing from his recent sickness at Atlantic City.

John Watson and Co., 4145 St. Catherine St. West, Montreal, have been adding electric lamps to their lines. These are being freely displayed in the store window and Mr. Watson expects that a trade can be developed for this line.

The firm, J. W. Hughes & Son, plumbers, of Montreal, was registered recently. The head of the firm, one of Montreal's leading master plumbers, W. R. T. Hughes, died very suddenly on February 15th last. The new members of the firm will be Mr. A. W. Hughes and Mr. U. W. Hughes, sons of Mr. W. R. T. Hughes, and grandsons of the founder of the firm.

RECENT REGISTRATION

The firm of J. Duhamel & Fils, plumbers, was recently registered in Montreal.

NEW FIRMS

The firm of Peterson & Pyke has recently commenced a plumbing, heating, and power work business at 38 Arthur Street, Winnipeg. Messrs. Peterson and Pyke were formerly employed by Cotter Bros., Ltd., of Winnipeg, the former as a plumber and the other as a steamfitter.

NEPTUNE COMPANY TO LOCATE IN TORONTO

The Neptune Meter Co. of New York, claiming to be the largest manufacturers of water meters in the world, have acquired the munition factory of the Russell Motor Car Co. at Dufferin and King Streets, Toronto, as a branch factory. The company has been in the Canadian field for some time, having a factory at Hamilton.

To operate the Toronto factory a new company is being formed to be known as the Neptune Meter Co., Ltd. J. Herbert Ballantine is to be president of the new company, J. B. Kirkpatrick secretary, Benjamin B. Vanderveer vice-president, and W. H. Randall general manager.

TRADE NOTES

The Owl Metal Co., Limited, Winnipeg, have started the manufacture of soldering salts, liquid and paste. They are also preparing to put out, when their new plant is completed, copper, red brass, yellow brass and bronzes in ingots.

N. B. ROONTREE

Of Swift Current, Sask., who as announced in the April 1 issue of Sanitary Engineer was elected President of the Provincial Association of Saskatchewan Sanitary and Heating Engineers.

Frederic Sara, manufacturers' agent, Calgary, Alta., has added to his other lines the agency for Cannon Iron Foundries, Ltd., Deepfields, near Billston. Staffs, England, for their lines of hollowware, castings, enamelled bath supplies, fittings, etc.

MAY SPEND $6,000,000

At least $6,000,000 will be expended, it is stated, by the General Motors Corporation in construction work already commenced, on their 38 acre site at Walkerville, Ont., purchased some months ago.

This announcement follows that made by W. C. Durant, of Detroit, president of the G. M. C., of an extension program involving a total expenditure approximating $37,398,000.

For several weeks men have been engaged in tearing down the old buildings on the site located on the Walker Road, preparatory to the commencement of building operations on the new factory.

APPOINTED ASSISTANT GENERAL MANAGER

John M. Gunn, foundry manager of the McClary Manufacturing Co., London, Ont., was recently elected a director of the company, and promoted to the position of assistant general manager. H. V. Kenerson, who has been head of the cost accounting department takes the position of foundry manager. Mr. Kenerson was released by the company to join the American army but has received his discharge.

SANITARY INSPECTOR HAS SPECIAL COP

Captain Alan Curry was duly appointed sanitary inspector of Sydney, Nova Scotia, at a salary of $80 per month, at a meeting of the Civic Board of Health on April 1st.

Mr. Curry will be backed up during the month of May and June when most of the work of inspection will likely be done by a special policeman, the idea being that a man in brass buttons following Mr. Curry would make backward householders more amenable to discipline.

The city charter of Sydney is being amended to permit the punishment of persons selling adulterated milk. A special war will be made on houses unfit for human habitation.

COMBINATION STORE

Sergt. T. Britton of Clifton, Ontario, has a novel combination for a small general store. He deals in electrical and plumbers' supplies, fruit, vegetables and flowers. Tommy, as Sergt. Britton is locally known, opened his store on March 29th.

PRESTON MAY APPLY FOR $150,000

The Board of Trade of the town of Preston, Ontario, is recommending the Town Council to apply for $150,000 under the provisions of the Ontario Housing Act, which was cited in the last issue of SANITARY ENGINEER, to relieve the housing problem.

Mr. George Mather, of the Board of Trade, who had been commissioned to draw up a tentative plan and to obtain a price on it presented his report.

He had plans for two sizes for houses. The smaller of these was brick veneer one and a half stories in height. The ground plan was 20 x 24 feet. It would contain living and dining rooms, kitchen, bath, bedrooms, and back porch, cemented cellar, rainstorm cistern, spruce floors, pine finish, pipeless furnace, and the necessary plumbing and electric wiring. The plumbing is connected up to the sewer. The electric fixtures and cement walks are not figured in. This house would cost $2,100 exclusive of land, while the larger house, which is a full two stories in height, and has a ground plan 24 x 26 would be about $300 extra.

PUDDLERS' WAGES DECREASE

Wage rates of puddlers of the Bethlehem Steel Co., at its Lebanon plant, have been readjusted on the basis of the new bar iron price of $2.35 per hundred pounds. No change was made in the wage schedule when the bar iron price was cut from $3.40 to $2.90. The last reduction in the price of iron, however, made an aggregate so large that a scaling down of wage rates, based on sale prices, was necessary, says a representative of the company. Several hundred puddlers and helpers are affected.

WILL TAKE ADVANTAGE OF ONTARIO HOUSING ACT.

Hamilton, Ontario, has nominated a committee composed of City Clerk Kent, Industrial Commissioner C. W. Kirkpatrick, City Treasurer W. R. Leckie and Building Inspector W. J. Whitlock, to prepare a report on advisability of adopting the Ontario Government's Housing Scheme and ways and means of working under it.

TO COMBINE SYSTEMS

An effort is being made to combine the waterworks of the four border cities on the Detroit River into one. The Essex Border Utility Commission authorized its solicitor to prepare a by-law to that effect for submission to the ratepayers of Windsor, Walkerville, Ojibway and Ford City.

James Sanderson and Company have purchased the plumbing and heating located at 1736 St. James Street. This business will be continued at the old stand at the address above given.

JOHN WATSON

Secretary-Treasurer the Canadian Society of Domestic Sanitary and Heating Engineers, who is working hard in an endeavor to make the convention in Montreal on June 3-4, the best on record. Mr. Watson states that encouraging reports are coming in, especially from Ontario, Quebec, Saskatchewan, Manitoba and Alberta. Mr. Watson would like to hear from British Columbia, New Brunswick, Nova Scotia and Prince Edward Island. How about you, boys?

SETS UP IN SARNIA

Clark Turner, of Sarnia, Ontario, returned from the East last week, where he has been purchasing machinery and stock for his new plumbing business. Mr. Turner's address will be Victoria Street North, and he will handle plumbing, sheet metal and heating work. Mr. Turner is well-known to the plumbing trade in Sarnia, having spent twenty years in the employ of W. J. Barrie, of that city.

A Peculiar Case.—Ex-Ald. Thomas Roden and a deputation of the Canadian Manufacturers' Association waited on the Toronto Board of Control to record their objection against the city's interference in the trouble between the Gutta Percha Rubber Company and the residents of West Lodge avenue, who complain of the incessant vibration of machinery on the plant. Mr. Roden, who was the spokesman of the deputation, stated that all the manufacturers of the city were concerned over the action of the Health Department in summoning the offending company to the police court for maintaining a nuisance. Industries, he said, should be encouraged to come here. "The street railway runs 24 hours a day," he claimed further. Mayor Church reminded the deputation that the people in that district were unable to sleep at nights. To Controller Maguire Mr. Roden admitted that no members of the association had been to visit the plant, but the stoppage of the machinery that caused the noise would throw 1,500 men out of work.

On the Side

HELPFUL CORPORATION

Pat: "This is the foist time inny of these Montreal corporations hev done innything to binnefit the workingman."

Mike: "How is that, Pat?"

Pat: "It is this six-cint fare. I hev bin walkin' to and from me work and savin' tin cints, and now I kin save twelve."

SELF PRESERVATION

Pat Flinn was sent to fix a radiator at the residence of a Toronto millionaire, and as he entered the front hall the butler, in a subdued voice, said:

"You are requested to be careful of the inlaid floors as you go through the halls. They have just been waxed."

"Oh, sure there's no danger of me slippin' on thim," replied Flinn. "I've spikes in me shoes."

SOME RAM

Recently there arrived at the United States Department of Commerce a letter from a foreigner asking that the writer be given the names and addresses of manufacturers of male water sheep. Maybe that wasn't a poser! For a week no one in the department, rack his brains as he might, could imagine what this man wanted. Many employees were called in and it remained for a woman to shed light on the situation. The woman read the letter and then said:

"Why, I think he means hydraulic rams."

And that was what the foreigner was inquiring about.

BAD FOR HIS CLIENT

Lawyers frequently make ludicrous mistakes. One lawyer not as discreet as he might have been in the expression of his ideas was engaged on a case concerning some pigs.

"Gentlemen of the jury," he began, "there were twenty-four pigs in the drove, just twenty-four; exactly twice as many as there are in that jury box."

LABOR COST PLUMBER'S PRESENT PROBLEM

Continued from page 36

tion of the state and not of the individual. It was a big problem, to be undertaken in a national sense. If the proper attention were given the matter the results would justify the attention given.

Efficiency is Greater

Whilst the average good plumber or steamfitter could and did produce well before the war, he is now a better workman. It is one of the points justifying the higher wages which he is now receiving. This, Mr. Linton thinks, was made possible through the use of machinery and because of the war requirements. A man had been given a certain work to perform. He had, under the temptation of higher pay, developed himself in efficiency along that particular line. The result had made of him a better workman and a much speedier one. In this way he had been able to deliver a greater amount of real work in a given period, and was therefore entitled to the larger wage scale. Were he able to temper his ideas regarding remuneration with reason there would be little complaint to make.

Larger Loans Made For Better Houses

Government Anxious to Encourage the Use of Better Building Materials

One result of the co-operation of the Commission of Conservation with the Housing Committee is that there has been introduced into the recommendations to be made by the Federal Government something that will help to avert a certain amount of fire waste which goes on in connection with houses. The Government of Ontario limits the amount which may be spent on a house to $3,000. The result will inevitably be that cheaper material will be used, and in the Commission's recommendation to the Dominion Government it was suggested that for a frame house with brick veneer, or frame house with stucco and shingle roof, the loan be for $3,000 if the house contain four or five rooms, and for $3,500 if there be six or seven rooms; and that if the house be built of brick, stone or concrete, with fireproofing material, the loan be $4,000 for three or four rooms, and $4,500 for six or seven rooms, the period of payment being 30 years instead of 20, at five per cent. The result will be that every man who wants to build a properly constructed house not only can get a larger sum, but can get it on the same monthly repayment plan as that of which the man who builds the cheaper house has the benefit. In other words, a man can get $4,000 for thirty years on the same monthly repayment plan as the man who builds the cheaper house can get $3,000 for twenty years. Of course, the payments in the case of the larger loan extend over a longer period, but the owner has a house of more durable construction. That principle has now been adopted and will be a direct recommendation by the Dominion Government. In adopting these recommendations the Government is taking a step forward in recommending the adoption of town planning principles in connection with housing schemes and in furthering these measures to secure the best methods of construction.

MONTREAL SHARE IS $5,000,000

Montreal's share of the Federal grant to erect homes for the working man is five million dollars. This amount is to be handed over to the civic administration by the Quebec Government, and it is therefore necessary to appoint a special committee that the work may be directed in an efficient and acceptable manner. The need of housing being pressing, and the building season approaching rapidly the thinking men of Montreal are already interesting themselves in the new proposal.

Still Kicking

—Sykes in "Philadelphia Public Ledger"

Business Men to Act

Chairman Decary had invited a representative committee to confer with him on this matter. This was done that the ideas of others might be secured and that the plans tentatively held by the Civic Commission might be placed before these citizens from various business interests within the city. Members of the Board of Trade were present from the Chambre de Commerce, Builders' Association, City Improvement League, Fabian Society, and the Trades and Labor Council. Some fifty or more attended.

BRITISH SCHEME FOR INDUSTRIAL RESEARCH

Great Britain is making vigorous efforts to hold her own in commerce. No stone is being left unturned to assure her a leading place in trade and industry. The British Advisory Council for Scientific and Industrial Research has established a fund of £1,000,000 to encourage industries to carry on scientific research. Naturally "much will depend on how this money is spent." It has been recognized that the war has made it essential that assistance should be given manufacturers in this important work. The Council points out that it is desirable to "avoid chaining the manufacturer to the routine of Government administration, however efficient." After much consultation and deliberation, the Research Department has recommended that the new fund should be expended on a co-operative basis in the form of liberal contributions towards the income raised by voluntary associations of manufacturers established for the purpose of research.

THE WASH ROOM TRAGEDY

They found him in the wash room of
the Pullman sleeping car.
Some thought that he had fallen and
been staggered by the jar;
Some fancied he had fainted, and some
guessed he'd had a stroke.
But the wise ones only chuckled, when
at last the victim spoke:
"I was shaving! I was shaving! Oh,
I can't remember more.
I was shaving, busy shaving, when I
seemed to hit the floor!"

It was early in the morning and the
train was pulling in
When the gentleman decided that he'd
scrape his cheeks and chin;
So, regardless of his neighbor, who
might want to wash his face,
He proceeded very calmly to make use
of all the space.
I can't tell just what happened, for
the room was very small,
And a lot of us were waiting, when
we heard the stranger fall.

On the leather cushions near him stood
his open traveling case
And his personal possessions occupied
each bit of space.
From the hooks his clothing dangled—
he'd monopolized them all;
There were shaving soap and powder
and some stuff we couldn't call—
Quite enough to stock a drug store, on
the wash stand strewn about,
Which is why the wise ones chuckled
when they found him flattened out.

No one seems to know the story, no
one seems to care to tell,
We found him cold and silent in the
wash room where he fell.
There are some who think he fainted,
some who think he had a stroke,
But the wise ones sit and chuckle, and
they treat it as a joke.
For they know that someone landed,
with a wallop swift and straight,
On the hog within the wash room, who
too oft had tempted fate.

—By Edgar A. Guest.

We have all met this chap.

COPPER IN MANITOBA

The copper discoveries of Manitoba are rapidly assuming considerable magnitude. Professor Wallace, Commissioner for Northern Manitoba, states that in one copper mine, as yet undeveloped, 20,000,000 tons of ore, averaging $8,75 a ton in value, have been blocked out. He estimates that, when railway facilities are available, this area will provide employment for 1,100 men for about fifteen years.

The nickel market may come largely under German control. An advertisement in the German papers inserted by an important Stockholm company offers to sell or to co-operate in working, the most extensive and at present best-known deposits of nickel ore in Scandinavia. Large users of nickel are informed that they may not only secure an abundant supply for their own requirements, but in large measure obtain control of the nickel market in the future.

Why My Men Are Loyal

Based on an interview with

FRANK WATERHOUSE

President Frank Waterhouse and Company

Reprinted by courtesy of "System," the Magazine of Business

A list of the businesses which Mr. Waterhouse has organized and controls would be a list of many of the most important undertakings in Seattle and the Northwest. He has had unusual success in creating loyal, profit-making organizations. And in this article are described his methods of handling one problem that he finds common and supremely important in all these organizations — men — the element that can most quickly make or break a business.

SHIPS and men are alike in many ways. I know something about both. Our business is shipping; and one of my principal business tasks is to make sure of the loyalty and ability of our men. Here is an instance of this similarity that exists between ships and men:

Occasionally, a fleet of merchant ships is offered to us for purchase or charter. Invariably we ask:

"What is the average age?"

We are not interested in knowing that two or three of them may be only two years old, if several have seen service of 18 or 20 years, and the average age, say, is 15 years, it is not worth while to investigate such a fleet further. The normal opportunities for profit making with vessels of that age are very poor. But when the average age of the vessels is only 5 years, we might be very much interested, as the cost of operating modern vessels is a great deal less than the cost of operating old vessels. Furthermore, vessels 5 years old have a reasonable expectancy of 15 years of useful service, while vessels 15 years old might have very few years left.

In the same manner we believe in a youthful organization of employees, made up of men in their prime. Youth, as a general thing, is aggressive, ambitious, and physically and mentally able to absorb constantly increasing tasks. Age is usually more ready to shift responsibilities than to assume them. Of course there are many exceptions to this rule, but as between a young man and an old man of equal ability we prefer the younger, because his expectancy of life is greater, his period of probable future usefulness is longer, and the expectancy of life of our business therefore—if made up of young fellows like him—is greater.

Don't mistake me. We do not let men out at the top in order to keep a young organization. When a man comes with us and makes good, he is here for life. We have a number of men and women who have been with us since our business was established in 1898. We do take men in at the bottom. The average age of our executive officers, department managers, and office employees is about 36 years. The fact that many of the men have been with us for a long time is the more noteworthy because we are in a new country. An ideal organization, as I see it, is old in service but young in years.

We have a valued competitor, in whose organization the average age is nearer 56 than 36. Which business, his or mine, do you think has the better chance of survival?

How We Branched Into Various Lines

Age, of course, is but one element in building an organization. Nearly any concern will succeed if the men are right. I say this out of an experience with many apparently diverse lines of business. For as the opportunities of a rapidly growing country presented themselves, we advantaged ourselves of them in various ways. Our ships plying the coast and Alaskan trade made us familiar with the possibilities of bringing Vancouver coal to Seattle. Out of this trade grew the idea of becoming sales agents and producers, and consequently our coal company.

Delivery problems in the coal company suggested the need for motor trucks; and the economies of purchasing from ourselves gave us the idea of becoming sales agents for one or two truck manufacturers. This agency has become one of the largest in the Northwest, handling now both trucks and pleasure cars. In connection with the pleasure cars, we again saw a need this time in local motor transportation, and we capitalized it by establishing a taxicab company, and later, a baggage service.

Our shipping needs suggested opportunities also, and we organized companies to handle the stevedore business, to build and operate docks, to operate tugs, and to underwrite marine insurance. Recently we undertook to build up an iron works, and have started to publish a magazine.

All of these organizations, with the single exception of the iron works, have grown either directly or indirectly out of our shipping activities. And always, as each new unit has been added, the principal problem has been to make sure the men were right.

We have no faith in patented plans for picking loyalty and skill. We have tremendous faith in the ability of management, by right methods, to bring out surprising skill, plus loyalty, even in men and women of only moderate ability.

It is a human problem, which no mere set of rules can cover. But perhaps we can describe our methods best by summing them up briefly and then explaining our thought in detail. Not as hard-and-fast rules, therefore, but merely as a way of phrasing certain principles that are fundamental in building an organization, I believe that a high average of loyalty and skill can be attained only if you:

1. Understand your employees—know them at first hand;

2. Let them as well as the management share fairly in what the business earns;

3. Keep the organization young—the average age low—fill gaps in the ranks at the bottom instead of at the top;

4. Give every man a job, and let him run it—judge him by results, not by his personal methods of working.

Misunderstanding, to start with the first of these principles, is the original basis of enmity, and the cause, I venture to say, of 99 per cent. of all the troubles that arise between employers and employees. It is easy to avoid—but few of us avoid it. The remedy is simple: meet the man with whom you disagree and talk out your apparent differences of opinion in common terms and on a common basis. Often the differences, defined in that way, vanish completely.

I am frank to say that five years ago it never occurred to us that it might be wise to go down to our docks in Seattle and talk with the laborers. We took little or no interest if they and their families were sick, or went without proper food and clothes, or were suffering in their homes from lack of coal, or could not meet the rent, or were just barely able to get along on wages they earned working for us. Since we have learned to take a human interest in these problems we have had more happiness, and greater prosperity.

Nothing gives me greater satisfaction and happiness than the kind of harmonious relations that exist between our employees and myself. We are one big family working together for the mutual benefit.

The other day I was talking with a labor leader who anticipated a strike vote in his union. Some of the men of the union were employed in our iron works.

"How about this, Frank?" he asked.

"Of course, we can't afford to injure you."

"No, you can't hurt your friends," I said.

That puts it in a nutshell. And the proposition works both ways. If the men and the management are friends, the men cannot injure the management—and the management cannot injure the men.

How Shall Labor and Employers Come to a Mutual Understanding?

Business is rapidly changing. Traditions vanish overnight. Old ideas about the relations between employers and employees are being examined and revised in the light of new conditions. We work on the basis that snobbishness, class consciousness, the whole chain of evils and artificial barriers to business success, must be swept away.

Every business man, of course, works out the problem in his own way. Our way is to know the men first hand. I am willing to let bank presidents cool their heels in my anteroom occasionally if necessary. But my door is always open to labor leaders We had a striking demonstration recently of the tremendous progress that can be made when men of divergent opinions sit down together and thresh out their differences.

Our immediate cause of trouble was the decision of the federal board charged with regulating the wages of workers on Government war contracts. The men had been led to suppose that the board would adjust wages to correspond virtually with the increase in the cost of living. The actual award—when it was announced—fell considerably short of their expectations.

The men immediately began to agitate a strike. And to cap the difficulty, word came from Washington that if the business men permitted the strike to take place, contracts aggregating hundreds of millions of dollars would be canceled instantly without further notice.

We laid these facts before the men. For our mutual interests we urged the formation of an informal arbitration board to discuss our common problems. We invited the men to submit the names of seven of their leaders for the approval of the business men. And we in turn proposed seven business men who were to be approved by the unions. These fourteen when chosen were to confer on the selection of a chairman.

I was chosen one of the members. When this committee first met, we were two antagonistic classes—capital sitting gloomily on one side of the table, labor on the other. Then we began to talk—to understand one another's problems—to see that we were considering not merely class benefits, but the welfare and interest of the entire community of which we are integral parts.

After but a few meetings there was no more ranging of sides. Men sat beside one another, regardless of whether they represented capital or labor. Dozens of delicate problems virtually solved themselves. All our cards were laid face up on the table. The original cause of class hatred—misunderstanding on both sides—was banished.

Although it has had a most beneficial effect in bringing employers and employees together, it is too soon to predict how successful its work will be. I believe, however, it is a move in the right direction, and that the best way to overcome labor difficulties is to become better acquainted with laboring men and to give them practical help with the many serious problems they have to face.

It is not always easy to take the point of view necessary for complete understanding. Often in the past we have been, perhaps unwittingly, unfair to employees by trying to grind the last cent. of profit out of their labor. Unfairness has undoubtedly been directly to blame for the forming of unions, which we sometimes denounce. This or that important business man has said to me in effect: "I would rather pay my general manager $50,000 a year than $10,000—$250,000 than $50,000—if I could find the man who was actually worth it."

Why?

Because the $250,000 man would grind out more profit for the company, perhaps from the men. This, I believe, is an unfair division; too much thought given to the managers, too little to the men. And it is my experience that there are tremendous possibilities in loyal, skilled men.

So I have felt in my business that we owe it to them to change our attitude. They, through their unions, and business through the changes that are rapidly taking place, will force us to change our attitude in any case. But if that were not true, we owe it to ourselves, as a matter of discarding a wasteful business practice, to substitute for our old troubles a good sound basis of mutual understanding.

Just now our labor situation is much disturbed. In the past, with one or two exceptions, we have gotten along well with the labor unions. I number among my best friends some of the principal labor leaders in the North-west, and it is difficult to quarrel with your friends. We of course believe in the right of both the employers and the employees to organize for protective purposes, and to bargain collectively. We believe it is our duty to uphold, in every way we can, the hands of conservative labor leaders.

I have found that the path of the conscientious labor leader, contrary to general opinion, is anything but an easy one. He should be helped in the fair performance of his duties by the employer. It seems sure that the working classes of all nations will organize for protective purposes under some banner or other. It surely is in the interest of all concerned that this organization shall be effected by membership in such bodies as the American Federation of Labor and their affiliated unions.

Directly out of this thought arises the second general consideration which I have already mentioned: namely, to let the employees, as well as the management, share fairly in what the business earns.

One Way to Lessen Labor Turnover

I am not by nature a philanthropist given to impractical schemes. The purpose of my organizations is to earn profits. And they have nearly all been at least moderately successful. My point is that the best way to increase profits, so far as the employees can help, is not to buy their financial worries as well as their services, through paying insufficient wages. There are tremendous possibilities for greatly increased profits through increased loyalty and skill alone.

Money alone will not buy loyalty. But you are not likely to have it in full measure without money.

We pay the highest wages or a little better, as a fixed policy. And we do more. We divide our profits in a fair manner with our employees. Every employee who has been with us over twelve months is entitled to participate in the profits. We distribute our profit payments to our employees twice yearly. While we have paid larger sums in the last few years than many concerns might find it possible to do, owing to unusual business conditions, yet we feel that if the employee, even one in a minor position, returns to us complete loyalty

ONE WAY TO WORK WITH MEN

A CAPTAIN who takes out a ship cannot wait on instructions from the owner if anything goes wrong at sea. He is the sole authority, charged with but one task—bringing his ship safely to port. So in business after a task has been assigned, there is but one thing in which we are interested—results. You can never tell what a man is capable of doing, what initiative or executive ability he will develop, until you give him the opportunity, and until you place the entire responsibility for the result of the work on him. It is a fact that if you share responsibility, the other man holds you partly to blame if there should happen to be any failure to come up to expectations.

and full service, he is worth above the market rate of wages, in our opinion, and we are glad to pay it as a matter of good business, and to make sure that the men are right.

Why, you may ask, do we pay a bonus that amounts to a great increase in the salary? I figured, simply, that it is just. Our employees are in the main responsible for large profits. They should share in what they help to create.

I have proved to my satisfaction that the bonus pays us well, mainly through the increased loyalty and pleasure our employees take in doing their work in the best way. At certain periods, for instance, we require hard and long-continued work. We scarcely know what it means to ask any one to work overtime. Every man and woman knows what his or her job is and stays until it is done. If needs be, the lights will commonly burn in our offices till midnight.

Besides, there is practically no labor turnover. People insist on staying with the company. Our experienced men seldom quit us. One of our girls was not as competent as we required. It was a question of reducing her salary or letting her go. We did the former, hoping she would quit.

"I think I'll stay," was her rejoinder "I can learn to do my work better."

Contented, loyal employees, without financial worries, naturally work a lot better than those in the background of whose minds are recurring thoughts of unpaid bills. Thoughts in business hours should be devoted to the job in hand.

When the war broke out we decided to encourage our boys to enlist in the service of this country or any of our allies. We agreed, during the period of their service, to pay them the wages they were receiving from us less the pay they received for their military or naval service, and to give them back their positions when they returned. The agreement has been carried out. Many of the boys enlisted. Several distinguished themselves and are now returning home with the happy assurance that a hearty welcome and the positions they left await them.

I insist on the point that if any man is in trouble of any kind, financial or otherwise, and goes to anybody except the boss for help, he is severely reprimanded. I consider it good business, not a waste of time, to attend to affairs outside the range of business that affect the interests of employees, when I can be of service.

Recently one of my executives was away on business. His draft questionnaire came to the house, and his wife, considering it of immediate importance, telephoned me to know what she should do. The questionnaire was not due to be returned for several days, but I had our company attorney go to the draft board and explain the circumstances. And I called the wife later to assure her that she need not worry.

It was a trifling service. But many misunderstandings arise from overlooking trifling affairs.

In addition to the salaries and bonus, my department heads all own stock and have a direct interest in profits. Every employee can hope to become a department head and stock owner, for, as I have explained, it is our fixed policy to fill the gaps in our organization from the bottom.

Some Rules We Follow With Our Executives

The considerations that prompt these financial arrangements with employees are primarily the considerations of good business and better profits. And there is a deeper consideration, not inconsistent with these. I put it last because it is perhaps a social thought even more than a business thought. But in my opinion no business man should fail to consider his social responsibilities.

The consideration is this:

I do not have to carry the burden of feeling that members of my family dress in furs, travel at will, take advantage of the best schools, or ride in luxurious limousines on profits earned from the labor of underpaid men and women. I feel that any man placed in charge of large affairs owes a duty, in return for the superior advantages accorded him, to the workers with whom he is associated.

The third general principle—keep the organization young, and fill gaps in the ranks at the bottom—I have already discussed. I feel that the importance of this policy should not be overlooked.

Rarely, and only for special purposes, do we take ready-made executives from the outside. We start our people at the bottom, and they learn our business thoroughly before they have the direction of affairs in their own hands.

Finally we let them run their own jobs. A captain who takes out a ship cannot wait on instructions from the owner if anything goes wrong at sea. He is the sole authority, charged with but one task—bringing his ship safely to port. So in business after a task has been assigned, there is but one thing in which we are interested—results. You can never tell what a man is capable of doing, what initiative or executive ability he will develop until you give him the opportunity, and until you place the entire responsibility for the result of the work on him. It is a fact that if you share responsibility the other man holds you partly to blame if there should happen to be any failure to come up to expectations.

"The balance sheet and the income statement are my tests of an executive's ability. We set a task—what we think can and should be accomplished. The man in charge handles the job in his own way, as long as the result is attained. He need not come to me at all unless he wants my advice. If the results are right, my hands are off. A serious and continued failure to attain the desired results of course calls for a reckoning, in which case there can be no clouds on the record.

"This is the easiest way I know of for me to handle my work, in the course of which I have many things to do besides attend to the details of operations. And the results are most satisfactory.

What are the Tests of Executive Ability?

"I cannot conceive of greater harmony prevailing in any business organization than in ours: where all our interests are mutual and the relations between employer and employee are based on sincere friendship and regard. Our business has principally succeeded through the loyalty and friendship which exists and has existed between our company and its employees; because of the low average age of our staff; because they started in with us when they commenced business life and for the most part have remained with us to the present time; because they are happy and contented and would not change their positions if an opportunity to do so presented itself; because we leave the working out of their jobs to them, judging the work solely by the result."

England Will Favor Colonies in Buying

May Be Revision of Tariff Upward, But Preference Likely For Colonies—Changes Will Be Made in Former Methods—Overseas Trade May Be Gone After Vigorously —Will Intensify Effort at Home

Interview by "Sanitary Engineer" representative with E. C. Townsend, 2nd vice-president and manager Crane, Limited

THAT there may be a revision of the tariff upward in England is thought possible by E. C. Townsend, 2nd vice-president and manager for Crane Limited, Montreal, Quebec. Mr. Townsend returned recently from a trip of several weeks to that country, and his observations lead him to feel that, when the tariff is changed, due and real consideration of a favorable nature will be given the Colonies, and that such preferential consideration will be afforded as the situation demands. He thinks that there will be no doubt of the wish to buy, in Canada, as well as in the other colonies, such goods as may have to be purchased abroad.

Will Seek Trade Too

Asked as to whether there was a likelihood of the British manufacturer seeking business abroad in various lines of manufacture such as porcelain ware, enamel ware, etc., Mr. Townsend believed that there would be a bid for this business. In many ways the British manufacturer had a good line of goods, and these would be pushed abroad. Just whether the conditions at this time will permit of foreign markets being greatly

(Continued on page 47)

Many New Bills Affect Retailers

Legislation Now Under Consideration at Ottawa Will Have Important Bearing on Merchandising in All Its Branches—Aim is to Make For Better Conditions in Business Generally

By T. M. FRASER, Ottawa Representative of the MacLean Publications.

EVERY year a large amount of legislation, or proposed legislation, comes before Parliament or its committee, of more or less importance to the retail trade, and this year is no exception to the rule. E. M. Trowern, the Dominion Secretary of the Retail Merchants' Association, always keeps a watchful eye upon the bills going through Parliament, and usually has a number to steer through himself; and whether he is promoting legislation or preventing it, it is all with the idea of forwarding the interests of the retailers.

SANITARY ENGINEER in a recent issue gave an account of the meeting of the Dominion Executive of the retailers, and referred to several matters which it was proposed that the Government should deal with in one way or another. In the issue of March 29, a full account was given of the proposed Bankruptcy Act, now before a committee of the House.

Legislation Needed

The following is the full agenda prepared to lay before the members of the Commons and Senate, as subjects requiring legislation: Bankruptcy Act; Requiring Merchants to Keep Books; Sale of Articles Left for Repair; Amendments to the False Advertising Act; Carrying of Parcels and Catalogs by Mail; Fire Insurance Act; Weights and Measures; Price Maintenance Legislation; Fixing of weight of contents of Cereal Packages; Adulteration Act; Inland Trade Commission; Government Employees to Come under Garnishee Act; War Stamps on Patent Medicines; War Profit Tax on Luxuries; Purchasing of Goods on Sabbath; Daylight Saving; Customs Confiscating Automobiles; Co-operative Societies.

Now Being Considered

A number of other items enumerated have been dealt with in one form or another. The requiring of merchants to keep books, amendments to the False Advertising Act, and Price Maintenance are now all before the Department of Justice for consideration. The sale of articles left for repairs has been dropped for the present. The carrying of parcels and catalogs by mail is being dealt with by a special committee. The Adulteration Act is before the Cabinet. Nothing will be done on the Inland Trade Commission this year. A bill will be introduced to deal with the matter of the weight of contents of cereal packages; and it may be noted that the weight of contents of salmon and lobsters and other canned goods has been discussed before the House at some length and legislation regarding it will likely be introduced.

Matters of Policy

There are several matters, such as co-operative societies and the confiscation of automobiles carrying liquor, which are a matter of policy and cannot be dealt with by legislation, but strong representation regarding them has been made to the Government and some action will likely be taken.

The Senate has now before it a bill entitled an Act to Amend the Criminal Code, respecting prevention of fire. This provides that everyone is guilty of an indictable offence who negligently causes fire resulting in the loss of life or property, or who refuses to make alterations, remove materials or supply apparatus when ordered to do so by the proper authorities.

A bill now before the House deals with the weight of contents of canned goods, referred to above. It provides that there shall be four sizes of cans for lobsters, containing not less than three, six, nine or twelve ounces avoirdupois respectively of dry lobster meat. No other size of can shall be used for lobsters without permission of the Minister. Such permission shall state the minimum amount of dry lobster meat packed in each size of can so authorized.

The Minister of Trade and Commerce has a resolution before the Committee of the House to amend the Fertilizers Act in several respects. The phosphoric acid contents in the guaranteed analysis of a fertilizer must be plainly stated in connection with each package sold. The vendor must affix stamps to the value of one cent for the value of each one hundred pounds sold, with other provisions regarding analysis.

A very lengthy bill regarding Canadian copyright is also before the Senate, and is being both urged and opposed by rival interests.

Dr. Sheard M P., has introduced a bill to incorporate the Wholesale Grocers' Association, which is now before the Committee.

One of the most important matters of legislation to the retailer is that dealing with the war tax stamp duty on patent medicines and articles in bottles and packages, on which an article by Mr. E. M. Trowern will be found on page 46.

Pressing Problems

The Government has got some other problems on its hands that are pressing for settlement, and on which action is being taken. There is the demand of the postal employees for more wages, and various threats as to what is going to happen if this is not attended to immediately. This is a problem that involves the whole commercial world, and those who had a taste of the delays that followed the trouble in Toronto last year when the men went out learned just how much inconvenience and loss it meant. In Montreal 1,200 employees of the Montreal Light, Heat and Power Co., Ltd., are on strike. It is understood that the main points at issue are the refusal of the company to recognize the union and wage differences. The settlement of this trouble is perhaps more important than appears on the surface owing to the number of firms dependent upon the power company for power.

Express Men, Too

In addition to these troubles the Canadian Express Employees have refused the award of the Labor Board and are expected to walk out. Some twelve hundred men are affected, and this may prove a more or less serious handicap at a season when business is increasing and express shipments growing larger from day to day, just before the Easter season. The recommendations of the Labor Board, although granting some concessions and increasing pay schedules, were not acceptable to the men.

PRACTICAL SHEET METAL WORK

(Continued from page 28)

a roof flange for pipe that is projecting through roof at the ridge. It will be noted that the patterns are identical. The same course is followed in spite of the fact that the elevation is somewhat different. The plan is the same, but the elevation differs, in that the centre of the flange at A B is turned down 90 degrees instead of being extended upward in the same direction.

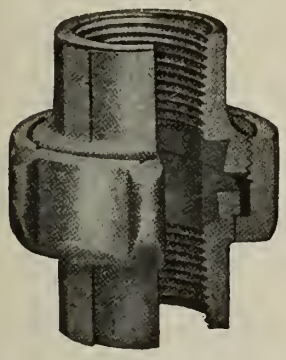
If the dotted lines are noted, it will be seen that an outline can be observed. If the reader will look over the various plates already published and carefully note how similar some of the patterns appear, he will be able to adapt many of them for purposes other than what the patterns were originally made for.

(Continued in next issue.)

New Goods Department

ROCKWOOD UNION

The R. Bigley Co., of Toronto, Ontario, has secured an agency to handle the new Rockwood pressed steel union, which is manufactured by the Rockwood Sprinkler Co., of Worcester, Mass. The new union, it is claimed, is tested to a



pressure exceeding 1,000 pounds and is fully guaranteed as suitable for use on lines containing super-heated steam at high pressure, ammonia, or hot gases. It is manufactured of the best quality pressed steel and is cold drawn. It is guaranteed free of sand or blow holes and to be stronger than a cast union. It is seamless and is protected from rust by a special coating. The union has two bronze seats, both ground to a ball joint, and is claimed to expand and contract equally with the pipe on which it is used, so eliminating leaks at the threads.

FUEL SAVER AND HEAT INTENSIFIER

The Thermos fuel saver and heat intensifier, now offered to the trade by the Heating Specialty Co., 505 Queen St. W., Toronto, will, it is claimed, save from 25 per cent. to 75 per cent. of the fuel bills.

It is manufactured of heavy galvanized iron, and, it is claimed, can be installed on any stove, range, furnace or boiler.

The saving is accomplished, it is said, by the retention of the combustible gases in the fire chamber, thus confining the heat in the furnace or boiler, thereby creating a hotter circulation of air or water.

It is further claimed that the smoke pipe remains comparatively cold, while an intense heat circulates through the register pipes or radiators.

NEW LIGHTING PLANT

The Matthews Engineering Co., of Sandusky, Ohio, have added to their line of Full Automatic Lighting Plants, which heretofore has consisted of 1, 2, 5 and 15 kilowatt plants, a new size known as their "Little Husky." It carries a 300 watt continuous rating on the generator. The makers state that this plant is made in the 32 volt type, same as their 1 K. W. plant, their argument being that even for so small a plant as this the limitations of a lower voltage make it most undesirable for the practical applications that a 15 light will obtain, This plant is the simplest possible kind of a direct connection of a generator to an engine. The plant is full automatic like all Matthews plants—starts itself when the battery needs charging and stops automatically when battery is charged.

The generator frame and engine crank case are integral. The engine is a 4 cycle, water cooled type, 2 in. bore, 3 in. stroks. The plant is guaranteed to have 35 per cent. overload capacity. A 60 ampere hour Willard glass cell storage battery is used with the plant.

ENGLAND WILL FAVOR COLONIES IN HER BUYING

Continued from page 45

England will favor Colonies in her Buying,....2 Col. Head.

developed is not altogether clear just now, but the difficulties have been and will be overcome. The British manufacturer is a different man, since the war started, and is unquestionably going to be a factor in world trade.

"It is very likely that the Consular agents of Great Britain in various parts of the world will be very much better informed than they were before the war," said Mr. Townsend. "The German agent was able to steal a march on him because he had a world of information at his command when an enquiry came in. "Now, I think, the British Consul abroad will be a different class of man. He will very likely be well informed as relating to the many products that are made at home. He will have a lot of tabulated information which will interest the prospective buyer. This he did not possess before, and very often he could not do more than give out the names of manufacturers of a given line, I would not be surprised if he will now be given a regular course of training to qualify him for this work."

Changes in England

While Mr. Townsend's visit was necessarily brief, he had opportunity to sense some of the conditions there. Manufacturers appear to be optimistic. They are maturing various plans that should enable them to carry out more speedy work than ever before. Generally, in a great many cases, the Englishman has not been as aggressive as he might,—not nearly as aggressive as many of his competitors. Always a gentleman, he has not realized the stern necessity of meeting competition, but he has changed his mind and his policy from this time forward, Mr. Townsend thinks, is to be one of sound, sane aggression.

There has always been a quiet and ready acquiescence to the foreign manufacturer in many ways, and in the steel industry manufacturers in Germany and other countries have been fast digging into the world trade for these lines at the expense of the English producer. This, Mr. Townsend feels, will now be more vigorously combated, and the production of many lines, will, in time, be much greater than it is now, and greater than it was before the war.

In the matter of intensifying business at home, the manufacturer will be more modern. He will realize that the home consumption is a thing possible of cultivation. Already, Mr. Townsend pointed out, there is a well-defined desire for better fixtures and more of them. "There are many places in which fixtures have been lacking almost altogether," said Mr. Townsend, "and it is likely that much new work will be installed in these places. This will probably be in homes as well as in factories and industrial plants."

Business to Improve

Regarding conditions in Canada, and the general tendencies for a renewed business activity, Mr. Townsend is confident. "Already contracts are being figured on, and these are for real work that is seriously planned. I think that there will still be care in buying, such as there has been in the past. Prices have been reduced from 12½ per cent. to 20 per cent. on some lines of valves and fittings and there will be a fair amount of work undertaken, I believe," concluded Mr. Townsend.

GENERAL MARKET REPORT

Continued from page 50

Lead Weak; Tin, Copper Are Firm

INGOT METALS.—Lead is down ¼c per pound, but other metals show little change during the week. Copper is holding steadily and the tin market has a fairly firm undertone. Antimony is without particular feature.

COPPER.—A very fair amount of business is being handled and position of the metal generally is much better. Prices are unchanged, but firmly held at 18c to 20c per pound.

TIN.—The market is steady and prices well maintained. Some business is coming to hand and stocks are reported pretty small. Locally the price ranges around 60c per pound.

ALUMINUM. — Interest is lacking, commercial factors still holding out of the market for any large quantities. A nominal figure of 50c per pound prevails, but this would probably be shaded very substantially for any actual business.

ANTIMONY.—Dullness marks the attitude of this metal. Price holds without change at around 8c per pound.

TO BUILD $1,000,000 PLANT

Erection of machine and assembling plants, at a cost approximating one million dollars, will take place at Walkerville, Ont., within the next few months, according to an official of the Maxwell Motor Co. The Walkerville subsidiary will be used as the distributing centre for the British Empire and for a large part of other export trade also.

Market Conditions and Tendencies

STATEMENTS REGARDING SUPPLIES AND TREND OF PRICES

THE MARKETS AT A GLANCE

LOWER prices have again been reached in many lines related to the steel and iron industries. One of the most important changes recorded is that on wrought pipe. The actual decline in this instance is not great, three to four per cent., but it is traceable to change in basic materials.

Another kindred product which has been revised downward this week is boiler tubes, the present scale of quotations being about 10 per cent. below figures formerly in effect. The belief is expressed that the bottom has been reached on these and that present basis may be expected to rule for some months. Figures today are appreciably below war levels, but still substantially above the pre-war basis.

Jobbers in many instances express and are showing a desire to get prices down to rock-bottom in line with changes in mill costs. This is further revealed in another decline this week in black steel sheets. It is felt buyers can safely come into the market for their requirements now and present scale of quotations should create a better feeling among probable purchasers.

Wrought nipples and couplings, along with malleable and cast iron pipe fittings, have undergone a slight revision downward. A change in brass goods has also been effected, compression lines along with valves and kindred lines registering declines of around 5 per cent.

The situation in enamelware is unchanged, though some interests feel that lower levels may develop as a result of drops in basic materials. Manufacturers point out that they did not follow the rapid advances of the markets on the other side of the line and that lower prices named there are just now getting in line with what market has been here. Closets have declined $1.50 each, both enamel and vitro lines being affected.

Lead pipe and lead waste pape are easier, the decline amounting to ½c per pound. Lead traps and bends have also come down, the decline amounting to 15 per cent. The present discount from list is more in line with the substantial declines made in the metal during the last three months.

The metal markets are fairly well maintained, copper and tin showing a firm undertone

TORONTO, April 12. — Markets show many revisions this week and the tendency all along the line is towards lower levels. Wrought pipe, wrought nipples, malleable and cast fittings are affected, and a general change in brass goods, including compression bibbs, valves, etc., has taken place. Boiler tubes are down about 10 per cent. and black steel sheets are also lower. Lead pipe and lead waste pipe along with lead traps and bends have declined.

Range Boilers Show No Change

RANGE BOILERS. — New developments are lacking in these. Prices remain at figures recently named, but there is only a fair amount of strength to the tone of the market. Business is still within rather a narrow compass.

Range Boilers	Standard	Extra Heavy
30-gallon	$12 25	$14 50
35-gallon	15 00	17 00
40-gallon	18 00	20 00
52-gallon	24 00	28 00
66-gallon	33 00	38 00
82-gallon	40 00	47 00
100-gallon	50 00	58 00

Closet Tanks and Seats Down $1.50

ENAMELWARE.—Prices on closet tanks and seats are down $1.50 each in new prices just issued to the trade. With oak tank and peat present quotation is $25.50 and enamel iron or white vitro tank is quoted at $27.50. Other lines show no revision, but some in the trade look for prices to recede somewhat following the declines made in many basic materials.

Bath-tubs, roll rim, 4, 4½, 5 feet, 24 to 30 in. wide	$32 10
Bath-tubs, 5½ ft.	35 70
Basins, flat back, 14 x 15 in.	6 00

Do., 16 x 24	4 92 4 80
Do., 14 x 20	4 25 ....
Closets, oak tank and seat	25 50
Do., enamel iron or white vitro tank	27 50

Pipe Fittings Revised Downward

SOIL PIPE FITTINGS.—Pipe fittings are again under revision downward this week, as will be noted in discounts named below. Wrought nipples and couplings, after remaining steady for some months, are on the downward move.

Soil pipe and soil pipe fittings hold at changes recorded in last issue. There is some business offerings, but this is not a heavy volume as yet. Discounts now in effect are shown herewith:

SOIL PIPE AND FITTINGS

Medium and extra heavy soil pipe, 2 in. to 6 in.	20%
Medium and extra heavy soil pipe, 8 in.	25%
Medium and extra heavy fittings, 2 in. to 6 in.	35%
8 in. soil pipe and fittings	15%

C. I. PIPE FITTINGS

Cast iron fittings	20%
Plugs	35%
Bushings	35%
Unions, standard	50%
Dart unions, ¼-inch to 2-inch	25%
Do., 2½-inch and larger	15%
Nipples, up to 4-inch	60%
Do., 4½-inch and larger	50%
Do., running thread 4-in. and under	30%
Couplings, 4-in. and under	40%
Do., 4½-in. and larger	20%

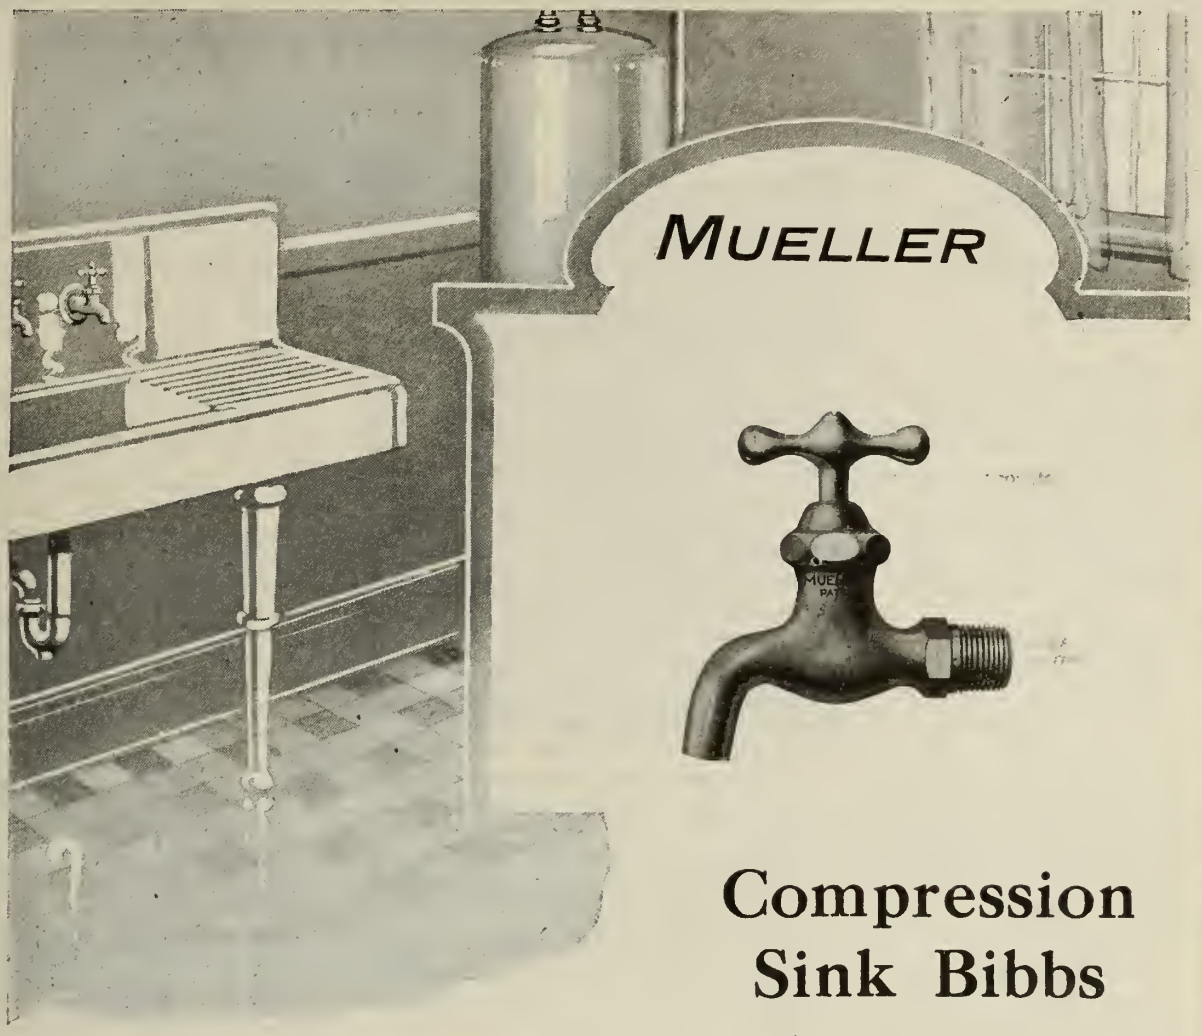
MALLEABLE FITTINGS

	Black	Galv'd
Malleable Fittings, Class A, lb.	$0 50	$0 60
Do., Class B, lb. net	0 21	0 30
Do., Class C, lb. net	0 14	0 21

Brass Goods Register Declines

VALVES.—Brass goods have undergone a general revision downward amounting to about 5 per cent., and in some instances slightly more. Practically the entire list is affected, the new discounts now ruling being shown below. Some very good business is being handled and a better feeling in respect to trade is expressed.

	Discount off list
Compression work, standard	50
High grade	49



MUELLER

Compression Sink Bibbs

SIMPLE elegance, combined with superior strength and wearing quality, is what you give your customer when you install **MUELLER** goods.

The many advantageous features of **MUELLER** compression bibbs give maximum service from the bibb as a whole. The anti-spreading device that breaks up the whirling motion of the water and the corrugated stem and handle, allowing the handle to be set at any angle without becoming loose or wobbly, are only two of these features.

MUELLER Bibbs are the best the market affords. Write for prices.

Wrought Pipe Prices Announced

WROUGHT PIPE.—In line with information supplied in SANITARY ENGINEER last issue, a decline is noted in new list of prices just issued on wrought pipe. This recession, while only amounting to about 3 per cent., is a natural reflection of the lower basis established on basic materials. The new list of quotations, effective from April 3, is as follows:

WROUGHT PIPE
Price List No. 39, April 3, 1919

Cotton Waste Holds; Oakum Unchanged

WASTE, OAKUM. — Cotton waste prices show no revision and the stronger feeling in the cotton markets has served to provide a better undertone to waste figures. Business is still rather limited, but outlook is considered very fair.

Oakum is without any particular feature of interest. There is some business being done and prices remain steady.

	Per 100 lbs.
Best American	$21 00-$22 00
Clipper, spun	21 00
Do., unspun	10 50
Plumbers', spun	10 00- 10 50

10 *Per Cent. Decline in Boiler Tubes*

BOILER TUBES.—Further reductions have been made in boiler tubes this week. The decline averages around 10 per cent. Jobbers report business very good and look for present prices to hold for some months to come. There is no difficulty experienced in getting supplies through as needed.

BOILER TUBES—	Per 100 feet Seamless	Lapweld
1 inch	$25 00	$.....
1¼ inch	29 00	.....
1½ inch	32 00	25 00
1¾ inch	32 00	25 00
2 inch	36 00	26 00
2¼ inch	40 00	27 00
2½ inch	41 00	30 00
3 inch	47 00	35 00
3¼ inch	.....	42 00
3½ inch	57 00	43 00
4 inch	65 00	56 00

Black Sheets Down; Galvanized Stiffen

SHEETS, PLATES. — Further revisions downwards have occurred in black steel sheets this week, jobbers expressing a desire to keep basis right down to rock bottom and in this way lend every encouragement to buyers to keep goods moving. Galvanized sheets show a slightly firmer tendency in change made during the week. Quotations now being made to the trade follow:

BLACK SHEETS—	Per 100 lbs.	
10 gauge	$5 00	$5 50
12 gauge	5 05	5 55
14 gauge	5 10	5 40
16 gauge	5 20	5 45
18-20 gauge	5 80	5 60
22-24 gauge	5 85	5 65
26 gauge	5 90	5 70
28 gauge	6 00	5 80
3-16 inch plate	4 90	6 25
¼-inch boiler plate	4 50	5 80

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

GALVANIZED SHEETS—		
10¾ oz.	$8 25	$8 50
U.S. 28	7 95	8 20
U.S. 26	7 65	7 90
22 and 24	7 50	7 75
18 and 20	7 35	7 60
16	7 20	7 45
12 and 14	7 10	....

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

Lead Pipe and Waste Down; Traps, Bends, Too

LEAD AND ZINC PRODUCTS.—Lead pipe at 11½c and lead waste pipe at 12½c per pound both show a decline for the week of ½c per pound. Downward prices on lead traps and bends are also provided for through the change from net list to 15 per cent. discount from list. Solder prices are unchanged. Business is reported both quiet and active with activity generally expected to be the ruling trend in a very short time. Prices prevailing to-day are:

Lead pipe, lb.		$0 11½
Lead waste pipe, lb.		0 12½
Lead traps and bends		10 to 15%
Lead wool, lb.		0 14
Lead sheets, 4 to 6 lbs., sq. ft., in rolls, lb.	0 10¼	0 10½
Cut sheets ½ to ¾c lb. extra and cut sheets to size, 1c lb. extra.		
Solder, guaranteed, lb.	$0 35	0 37
Solder, strictly, lb.	0 33	0 37
Solder, commercial, lb.	0 30	0 36
Solder, wiping, lb.	0 29½	0 32½
Solder, wire, lb.	0 40	0 45½
Zinc sheets, per lb.		0 17

Copper Reveals Signs of Strength

OLD MATERIALS.—There is no evidence that scrap metal prices have started to climb yet, but it is easy to notice that there is a great deal more strength in the market than for some time past. There is a chance that fourth quarter copper may be hard to get. Just now dealers are not quoting or selling on that delivery, and if this should keep up for any length of time it would be certain to drive up the price in the local scrap markets. As it is those who have red brass now are asking more money for it.

In the other classes of metals much the same feeling is apparent. There have been no price changes on at the lists published. But there is a growing and a well defined tendency on the part of the trade to hold material instead of making sales under present circumstances. Although dealers do not care to come out and say so it is one of those situations where it is felt that a great many things may happen on very short notice and one of the happenings is likely to be a strengthening of prices which dealers will have to pay in order to induce holders to part with their material.

Dealers' Buying Prices—	
Tea lead	0 03
Heavy lead pipe	0 04
Pipe scrap	8 00
Stove plate, per ton	10 00
No. 2 busheling	8 00
Yellow brass	0 06
Red brass	0 08½
Light brass	0 05
Scrap zinc	0 05
Heavy copper	0 15
Wrought iron, No. 1, per gr. ton	15 00
No. 1 machinery cast	14 00
Heavy melting steel	9 00

SPELTER—Buyers are showing more interest with a consequent improvement in standing of spelter. This has not resulted in any price change, but sales are better. Quotations are being made at 8¼c to 8½c per pound.

LEAD.—The price has sagged ¼c and is quoted from 7c to 7¼c per pound this week. Business is not very brisk, but there is a reasonable amount of activity noticeable.

BOILERS AND RADIATORS DROP

Another decline has been recorded in boilers and radiators this week. Steam boilers are down 3 points, while the round hot water boilers show no revision. Standard radiation has declined 6 points and wall radiation 8 points. These price changes, it is indicated, are not a result of market conditions, but have been brought about largely through competition. Manufacturers in the States are responsible for starting the price cutting, it is said, and the declines they have instituted are responsible for the steps taken by the Canadian manufacturers to take care of the trade here.

FOR SALE

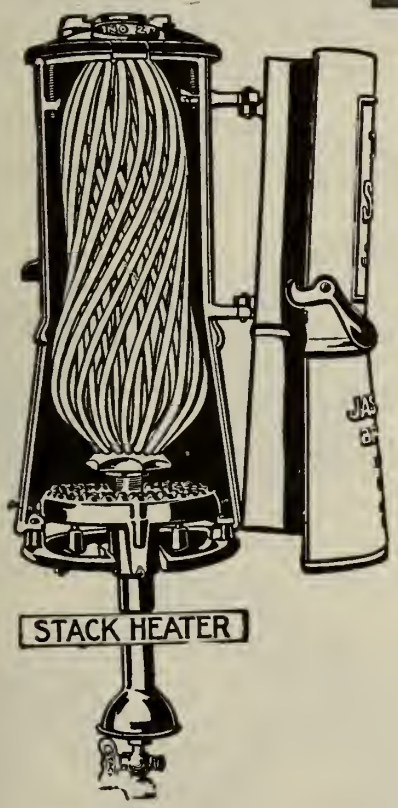
FOR SALE — PLUMBING, HEATING AND electrical business in city of sixteen thousand, established for 15 years. First-class stand. Not a large amount of capital required if security is given. Box 242, Sanitary Engineer.

The "*Morrison*" Cellar Drainer means a Dry Cellar

It works at pressures as low as ten pounds and has all its working parts above water.

The mechanism is simple, which means few repair bills.

It takes up very little room and is easily installed.



Whether for your own use or to sell to your customers it will pay you to investigate the satisfactory, sure and perfect working qualities of the **Morrison Cellar Drainer.**

Dealers are making splendid profits selling them. May we send you complete information?

This is the STACK gas water heater. You will notice at once the small size and large number of the coils which mean quick heat. The sturdy lines on which this heater is built should also appeal to you. For the sake of your reputation you must satisfy your customer. You will be sure of doing so if you sell him the STACK.

The Value of the Business Press to Business Men

"Business men do not realize the value which trade journals and technical magazines may have for them in increasing the efficiency of their factories and in giving them a broad and comprehensive view of their business.

"Our foreign competitors read almost every article published upon their business with great care and thoroughness. Many of them have duplicate copies of their favorite trade paper sent to their homes so that they may read them away from the business without being disturbed. Many foreign manufacturers contribute articles to these journals on phases of the business with which they are most familiar. Such articles are bound to be helpful and have a constructive effect.

"Our trade journals and technical papers are the best in the world, and they should be supported and encouraged by our business men.

"Copies should be placed where employees can see them and they should be urged to read and study them.

"These papers are preaching the gospel of sound business on practical lines and are helpful not only to business but to the country as a whole.

"If the suggestions made by them in the past had been followed by our business men it would not be necessary at this time to point out some of the fundamental weaknesses in American business."

—Edward N. Hurley, formerly Chairman of the Federal Trade Commission, in "The Awakening of Business."

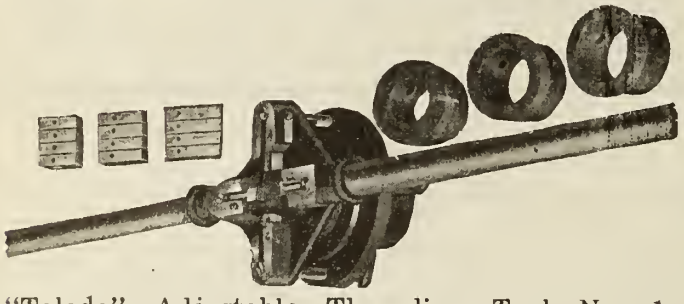
"Jardine" and "Toledo" Pipe-Threading Tools

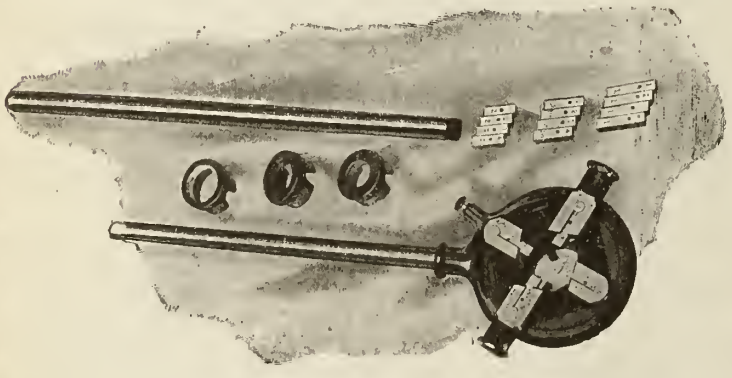
REGISTERED J TRADE MARK

Perfect Threads at One Cut

"JARDINE" or "TOLEDO" Dies cut only with the mouth of the cutter. As the tool advances on the pipe the cutters open out so as to make a proper taper on the thread, the back of the cutters following in thread, do no cutting, they merely steady the tool. The result is perfect threads at one cut.

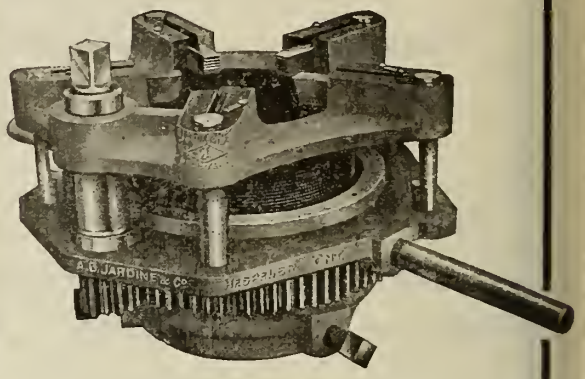


"Toledo" Adjustable Threading Tool No. 1, Capacity 1 to 2 in., inclusive.



"Toledo" Adjustable Ratchet Threading Tool No. 1A, Capacity 1 to 2 in., inclusive.

"Toledo" Geared Adjustable Threading Tool No. 2½. Capacity 2½ to 6 in. inclusive. Weight, 120 lbs.



One Man Does the Work of Two

With the mouth of the cutter doing all the cutting, friction of cutter on pipe is reduced to a minimum. Every ounce of strength exerted is utilized in actually making the thread, which means that the cut is made quicker with much less labor.

No Cams or Jimcracks to Wear and Get Out of Order.

"JARDINE" and "TOLEDO" Tools are built solidly for service. There are no unnecessary gears, nuts, bolts or movable parts to wear, break or be mislaid. There is nothing intricate about their mechanism, nothing but what is readily understandable and easily looked after. Long life and low maintenance cost are outstanding "JARDINE" and "TOLEDO" features.

With a Ratchet They Work in Any Corner

The Ratchet feature of "JARDINE" and "TOLEDO" tools permits of threading being done on pipe actually in place, no matter in how awkward a position. The resultant saving on one or two such jobs often equals the price of the tool.

Order "JARDINE" and "TOLEDO" Tools from your jobber.

A. B. JARDINE & CO., LIMITED, HESPELER, ONT.

Sole makers of "Jardine" Pipe-Threading Tools. Sole licensees to manufacture and sell Toledo Pipe-Threading Tools of Canada.

CAUTION !

This is a personal message to you. Kindly read every word—you owe it to yourself to do so.

THE thing every steamfitter prizes most highly is his reputation. Without it his standing with his customers—his business—everything is *valueless.*

When a customer calls you in to repair a leaky or cracked boiler you feel it your duty to give him a good job. That's the *only* way to make money. If your judgment tells you it's the kind of job on which to use "X" Liquid—your reputation is at stake if "X" doesn't make good. That is why we take so much care in making "X"—and seeing that it gets to you sealed—branded—and in good condition.

Now, if you should use an imitation of the genuine "X" Liquid, you are not going to get "X" results. Patents on "X" Liquid are allowed—and others are pending. The quality of "X" *can't* be imitated. When this inferior imitation fails to do the work properly, who gets the blame? Who stands the comebacks? Who loses time and money? YOU—*of course.*

So we owe it to our friends to warn them that there is no other product on the market that can do what "X" does. "X" is the ONLY *Scientific* Process of repairing leaky and cracked boilers—and for making them LEAK-PROOF — RUST-PROOF — and SCALE-PROOF.

"X" Liquid is making money for over 24,000 steamfitters. These men will hardly risk their reputations on any unknown, untested product. They'll stick to the genuine "X"—*every time.*

Ninety-nine out of every hundred manufacturers of boilers and radiators use, sell and recommend "X" Liquid. Every good jobber sells it. And the Government uses "X" regularly.

Every can of "X" Liquid carries a guarantee to make 100% good—*or your money back.*

Deliveries are very bad this winter—due to freight conditions. *Keep plenty of "X" on hand for emergencies.*

PIPE AND THE PUBLIC WELFARE

By R. C. McWANE

A Book Just Off the Press

Every sanitary engineer should be the possessor of this book. It deals with pipe-making of all kinds, cast iron, wrought iron, steel, wood and tile pipe. It is valuable because it gives the users of pipe a true idea of how pipe lasts under various conditions when in service.

Price $1.00 Postpaid

Men Worth Reaching

THE SANITARY ENGINEER, Plumber and Steamfitter of Canada, was established in 1907. The subscribers represent the most progressive members of the sanitary plumbing and heating trade in Canada. The paper is issued twice monthly, on the first and fifteenth of the month. Circulates in all provinces of Canada and also in Newfoundland. There is no waste circulation on SANITARY ENGINEER, because subscribers buy the paper for business. The advertising pages are read closely by the largest buyers of sanitary and heating goods in Canada. These men buy for business as well as for private consumption and therefore represent the best class of readers. When you advertise in the SANITARY ENGINEER you are assured of an attentive audience, who are looking for information about your goods and your method of doing business. Cost of advertising is very moderate indeed. We will gladly supply detailed information regarding rates, circulation, etc.

If interested tear out this page and place with letters to be the SANITARY ENGINEER.

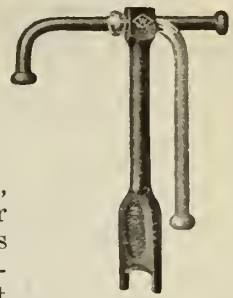
Williams' Falcon Drop-Forged Waste Plug Spanner



THE old adage tells us, "Necessity is the mother of Invention," but makes no mention of the father; presumably he is "mere man." At any rate, we are rather proud to have "fathered" the invention of the useful and badly needed tool here illustrated.

It is far more efficient than any possible makeshift, and its folding handle allows it to be readily carried in the pocket. The dimensions of the "finger ends" make it universally adaptable to all sizes and forms of basin and sink plugs and grates. The tool is hardened for severe service. Descriptive Booklet on request.

J. H. Williams & Co.

Agents for Alberta, Saskatchewan, British Columbia and Manitoba

First Cost *versus* Upkeep Cost!

The purchase price means nothing if the upkeep cost is not low.

The purchase price of King Boilers is no more than the average boiler and yet—

The consumption of fuel—*the upkeep cost* is lower—considerably lower.

The thin, peculiarly shaped waterways in the "King" mean quickly heated water and perfect circulation, which causes a saving in fuel because it obviates the necessity of "extra firing" to move cold water from the radiators.

The Trade should use this quick-heating, fuel-saving argument now while fuel is scarce and high in price.

This is a "Q" Foot Valve

And it Just *CAN'T* Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

"HAUSE" PIPE JOINT CEMENT

For steam, water, air, oil, gas, gaskets, etc. The cement that cements. Sets like gum. Allows no leaks.

The Great Value of "HAUSE PIPE JOINT CEMENT" lies in its peculiar chemical properties which permits of its hardening and expanding after the joints are made up. In making up joints it has the same effect as a lubricant on the best graphite, and while the joints may be made and broken readily, a perfectly tight joint is maintained at all times. Comes in 1-lb., 5-lb., 15-lb., 25-lb., 50-lb. cans, 100-lb. barrels. Manufactured in ready mixed and powder form. Ask your jobber for prices, or write us direct.

Becoming a Bigger Man

WHAT is the difference between some men you know and others known to you? Why are some men earning $3,000 a year and some $30,000? You can't put it down to heredity or better early opportunities, or even better education. What, then, is the explanation of the stagnation of some men and the elevation and progress of others?

We are reminded of a story. A railroad man, born in Canada, was revisiting his home town on the St. Lawrence River. He wandered up to a group of old-timers who sat in the sun basking in blissful idleness. "Charlie," said one of the old men, "they tell me you are getting $20,000 a year," "Something like that," said Charlie. "Well, all I've got to say, Charlie, is that you're not worth it."

A salary of $20,000 a year to these do-nothing men was incredible. Not one of the group had ever made as much as $2,000 a year, and each man in the company felt that he was a mighty good man.

Charlie had left the old home town when he was a lad. He had got into the mill of bigger things. He developed to be a good man, a better man, the best man for certain work. His specialized education, joined to his own energy and labor sent him up, up, up. To put it in another way: Charlie had always more to sell, and the world wanted his merchandise—brain, skill and ability. Having more to sell all the time, he got more pay all the time.

Charlie could have stayed in the old home town; could have stagnated like others; could have been content with common wages. In short, Charlie could have stayed with the common crowd at the foot of the ladder. But Charlie improved himself and pushed himself, and this type of man the Goddess of Fortune likes to take by the hand and lead onward and upward. Almost any man can climb higher if he really wants to try. None but himself will hold him back. As a matter of fact, the world applauds and helps those who try to climb the ladder that reaches towards the stars.

The bank manager in an obscure branch in a village can get out of that bank surely and swiftly, if he makes it clear to his superiors that he is ready for larger service and a larger sphere. The humble retailer can burst the walls of his small store, just as Timothy Eaton did, if he gets the right idea and follows it. It is not a matter of brain or education so much as of purpose joined to energy and labor. The salesman or manager or bookkeeper or secretary can lift himself to a higher plane of service and rewards if he prepares himself diligently for larger work and pay. The small manufacturer, the company director, the broker—all can become enlarged in the nature of their enterprise and in the amount of their income—by resolutely setting themselves about the task of growing to be bigger-minded men.

Specialized information is the great idea. This is what the world pays handsomely for. And to acquire specialized information is really a simple matter, calling for the purposeful and faithful use of time. This chiefly.

One does not have to stop his ordinary work, or go to a university, or to any school. One can acquire the specialized information in the margin of time which is his own—in the after-hours of business. Which means: If a man will read the right kind of books or publications, and make himself a serious student at home, in his hours—the evening hours or the early morning hours—he can climb to heights of position and pay that will dazzle the inert comrades of his youth or day's work.

IF business—BUSINESS—is your chosen field of work, we counsel you to read each week THE FINANCIAL POST. It will stimulate you mentally. It will challenge you to further studious effort. It will give you glimpses into the world of endeavor occupied by the captains of industry and finance. With the guidance of the POST, and with its wealth of specialized information, you, a purposeful man, aiming to go higher in life and pay, will find yourself becoming enlarged in knowledge and ambition, and will be acquiring the bases and facts of knowledge which become the rungs of the ladder you climb by.

It is the first step which costs. But this cost is trivial—a single dollar. We offer you the POST for four months for a dollar. Surely it is worth a dollar to discover how right we are in our argument. If you have the will to go higher in position and pay, sign the coupon below.

THE MACLEAN PUBLISHING COMPANY, LIMITED,
.—143-153 University Avenue, Toronto.

Send me / us THE FINANCIAL POST for four months for one dollar.

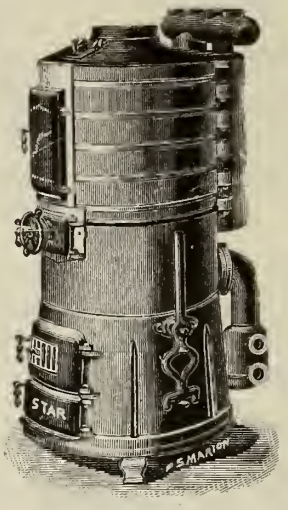
Thousands of Star Boilers in Use requiring repair Parts



It will be a long time before folks forget the coal troubles of the last few seasons.

The principal feature of the Star Boiler is that no other round hot water boiler has any coal-saving improvement not embodied in the "Star."

Then, too, while boiler installation and repair time is here, why not stock up with Star parts, for which O. Belanger has taken over the rights and is now making?

Many thousands of Star Boilers are in use requiring these repair parts hitherto unobtainable.

Write to us at once in time to catch the season's business.

We guarantee prompt deliveries.

O. BELANGER, REG'D.
Amherst Street
MONTREAL

The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH

Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with wood handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

Nut with Nut-Guards

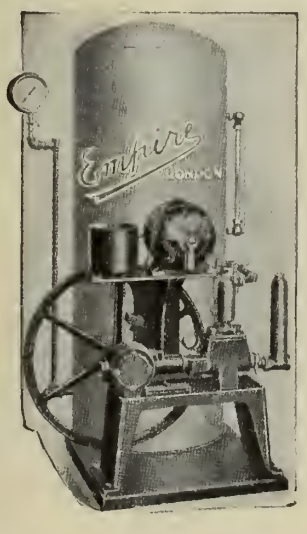
Sanitary Engineer

Plumber and Steamfitter of Canada

VOL. XIII. PUBLICATION OFFICE, TORONTO, MAY 1, 1919 No. 9.

The Sanitary Engineer And The Farmer

FARMING communities are no longer content with the old, antiquated sanitary and water systems. Why should they be? Why should they not enjoy the pleasures and comforts that heretofore have been restricted to city life?



The farmers' wives want running water in their homes. They want it hot and cold for bathing and all other purposes—they want indoor lavatories, indeed everything. And, what is more, they can pay for it. Money was never so free in the rural community.

Here, then, is where the sanitary engineer and the farmer can get together. Hundreds of farmers all over the Country are looking for improvements. Many of them contemplate building new homes, having water and electric lighting systems installed, but the sanitary engineer must make the first move.

We help you by placing absolutely complete lines of all these requirements at your disposal. There is nothing in this line we cannot supply. Write us for our illustrated Catalogue. Our facilities are at your service.

Why Jenkins Bros'. Valves Are Superior

Fig. 106

They are the original renewable Disc Valves. They have more imitators than all other makes of valves combined. They have kept pace with increasing steam pressures and severe working conditions. They are of the simplest design, and can be easily repaired by any man of ordinary intelligence. They are made interchangeable in every part, and any part can be duplicated promptly and inexpensively by the dealer. In the majority of cases they can be repaired by merely changing the disc without the laborious task of regrinding.

Fig. 108

Fig. 114

They are recognized as the Standard Steam Valves in all parts of the World, and wherever there are supply houses—Jenkins Bros'. Valves will be found. The Standard of quality never changes except to improve, and while to-day there are hundreds of imitators, the sales of genuine Jenkins Bros'. Valves are constantly increasing.

PIPE THREADING TOOLS

Take Another Look At This Job

ESTABLISH PEACE

If you desire to establish lasting peace in your shop, you will have to furnish your men with good tools. Men will not do the same amount of work if that work is hard. The more you *INVEST* in tools if they're good tools, the less you will SPEND in labor. To invest is to establish an asset, to spend is to create a liability. Our tools will save you money and make peace in your shop.

ESTABLISH PROFIT

Work made easy becomes a pleasure. Jardine and Toledo Pipe Threading Tools make threading pipe so easy that a boy can thread a 4-inch pipe as easily as he can thread a ½-inch pipe.

Not only so but when a thread is made with one of our tools it's a good thread. No cutting off pieces of pipe. No lost time and no leaks. That's the way to establish a profit on every job.

A. B. JARDINE & COMPANY, LIMITED, HESPELER, ONT.

Quaturn Ball Cocks

Did you ever sell a **whistling, noisy Ball Cock?** It didn't advertise you very well, did it? And very likely your customer was not much pleased either.

Next time use Quaturn.

Because, under moderate pressure they operate quickly, positively and noiselessly.

Because the working parts may be renewed when worn, without taking off the body and they are interchangeable with all other Quaturn fixtures.

Because they close with the pressure and therefore tend always to close tighter, eliminating leaks.

Because a satisfied customer means more business for you.

BULLETIN No. 1.

Earn the good-will of clients by advising them to include gas piping in the Plumbing Contract.

Every building needs Gas for one purpose or another—No building is complete unless adequately piped for Gas.

Gas is acknowledged to be the cleanest — most economical and most dependable fuel.

Phone Adel. 2180, "Builders' Service Bureau," and our representatives' experience is at your service—free.

The Consumers' Gas Co.

19 Toronto St. - - *Adel. 2180*

"Daddy, did you get that heating Contract?" "I Sure Did!"

"SAY, Daddy, me and mother *knew* you would get it, all the time!"

"Yes, you funny little fortune-teller, *I* was sure of it, too!"

"Why, father?"

"Because Dad always bids on MOLINE HEAT installations! If a schoolhouse is to be built so little girls like you can be warm and comfortable in it, I tell the building committee how Moline Heat has heated other school buildings, all over the United States. If a man is going to build a home in which he and his family are to be always warm and comfortable, I tell him how Moline Heat has heated other homes, all over the United States. Moline Heat, you see, always heats *any* sort of building the way a building *ought* to be heated. The installation always gives *permanent* satisfaction. That's why one customer is always glad to tell other people about Moline Heat. And that's why your Dad gets so many contracts from people who want only *the best.*"

Moline Anti-Syphon Seal takes the place of automatic traps.

"Gee, I'm *glad* you handle Moline Heat, Dad!"

"I guess your mother is, too—it's made our bank balance grow so big!"

If you want to know how "Dad" gets all of these contracts write today for the Moline Heat catalog.

Some good territory still open for special sales representatives. *Address Dept. G.*

GALT -:- ONTARIO

FOR MORE PLUMBING WORK

In looking over our correspondence, I find an enquiry asking why our Company does not conduct an advertising campaign such as we have suggested for the trade as a whole. It can't be done.

At least it can't be done and maintain the policy of the Company in distributing its products through the jobber, and recognizing the plumber as the last channel through which all plumbing material should go before it reaches the ultimate consumer. Direct advertising for the purpose of creating a demand for our goods means direct enquiries, and rather tends to destroy a system which is at once logical and economical.

Still we want more business and in this period of re-adjustment and reconstruction much work must be done, and a great deal of money spent to educate the public and create a better demand for plumbing work. This work is necessary; it has been neglected in the past four years and the only question now is how this fact can be best brought to the attention of the public.

Our opinion is that it should be done by and through the plumber with the assistance of the interested manufacturer, but how is the question? All these semi-monthly talks to plumbers are for the purpose of getting an expression of opinion. Will you consider it? It means selling two bath-rooms where one was sold before.

"Service" Success Secret of Galt Firm

Scott and Bennett Stock Quality Goods and Then Let the People Know They Have Them—Progressive Methods in All Departments Have Resulted in Steadily Expanding Business—Electrical Fixtures Big Line

Neat, attractive window displays add prestige to any store. This illustrates a display recently arranged by Scott & Bennett, Galt, Ont.

SELECTING a stock of quality goods and then displaying it attractively has been the cornerstone upon which Scott & Bennett, plumbing and electrical workers, Galt, Ont., have built up a steadily improving business. The prospective buyer no sooner enters the main door of the premises than he finds himself facing a display of electrical fixtures that is most artistic. Especial care has been given by the firm in arranging the fixtures so that buyers can gain a fairly accurate idea of just how they will look when installed in the home. The whole general effect is most pleasing and while a number of different designs and styles are shown the arrangement is such that buyers are not bewildered. On the contrary they can decide quickly and accurately whether such and such a design would harmonize with the general plan of the room for which they require it or whether another design could be used with better effect.

Not Easy to Do

It is not an easy thing to take a lot of fixtures and arrange them so that all will show to their best advantage. It is an important matter though, from the point of salesmanship, to be able to do this and still more important to be able to do it and do it artistically in a limited space.

Besides the electrical fixtures this showroom also contains a plumbing display among which are featured a couple of pedestal lavatories separated from the other lines, shown so as to suggest their best selling points to the casual purchaser.

The rear portion of the show room is used for office purposes and is separated from the display area by a neat counter railing and well-designed pillars.

Plumbing Display

A room beyond is used exclusively for displaying plumbing goods and all the latest designs and up-to-date installations are shown. In arranging the displays care has been taken to leave plenty of space so that prospective purchasers can examine the various lines and see how they work. The same general effect is carried out here as in the

electrical display that buyers can see just about how the goods will look when installed in their own homes.

Throughout the plumbing and electrical displays the suggestion is unconsciously gained by the arrangement and variety of the goods that Scott & Bennett not only have a large and complete stock but that they have goods of high quality and that the firm is prepared to render service.

Big Help in Selling

An impression of this kind working unconsciously in the mind of the buyer is a big help to the dealer in helping him close sales. It is often stated by some of the biggest firms in the country that goods well displayed are half sold, and while this may be a trifle exaggerated good display is undoubtedly a tremendously important factor in selling. The firm that not only displays its goods well but shows a stock that says plainly: "We carry only the best class of merchandist," has gained another big step in closing the sale.

This is the impression a visitor to the display rooms of Scott & Bennett obtains whether it is in the electrical section, the plumbing goods or the section where bathroom fittings are shown.

Business Has Grown

James Scott stated to SANITARY ENGINEER that the business has grown steadily. Mr. Scott is modest about the matter but the whole secret of this growth from the small beginning to a leading place in the business life of Galt, has resulted from the practice of good methods, two of the most important being careful selection of stock and then proper display. The firm has kept pace with modern developments that make for service. A motor truck delivery has displaced the old time horse and wagon, and in the shop time-saving devices have been installed to enable the twenty employees to produce maximum results.

Taken to the Job

The workshops are not extensive but Mr. Scott explained the plans which have been adopted to practically transport the workroom to the job, This not only makes for service where the customer is concerned but saves space for the firm.

The heating department occupies a large place in the activities of Scott & Bennett, and a stock of reserve radiation is carried as well as all lines required for quick action in case hurried changes are necessary or repairs required. A large warehouse at the rear of the building is stocked both upstairs and down with plumbing and heating materials. This is invaluable from a service standpoint as it means that no matter how quickly a client may call for material or repairs the firm is in a position to handle the order promptly. It is this sort of service that means repeat business and that causes one satisfied customer to tell about the good service he secured and bring others.

Get Other Trade Too

The firm has a large yard and in this is kept a stock of vitrified tile, fire brick and similar materials. These are not usually included in the regular stock of sanitary and heating firms and bring in a lot of good business that carries a good profit. This stock is arranged carefully and neatly so that whatever is required can be found quickly. Attention is also given to providing facilities by which the heaver materials can be handled easily and quickly, thus saving time, trouble and expense.

Added to their idea of service to their customers, Scott & Bennett have enthusiasm. They are enthusiastic about their profession, about their stock and about their service. They have been careful to get goods that their experience has taught them will give results and that they can stand behind. To this they bring the technical knowledge requisite to making a satisfactory job and they take the pride in doing this that good workmen always feel in work well done.

Business Detail

This same spirit of progressiveness and aggressiveness is apparent in all departments and is a combination that makes success. The same care is given to cost-finding, to accounting, to collecting and the other details of business that are applied in getting and filling orders and the result has been a steadily expanding trade.

Outlook Generally Shows Improvement

Representative Manufacturers Speak of Conditions To-Day—Feeling Optimistic—Trade Better—Prices Seem Settled Getting a Fair Return For Work—Aggressive Tactics Needed

"BUSINESS has been steadily improving and is a lot better now than it was last year this time," said O. L. Robb, manager of the Toronto branch of the Empire Manufacturing Co., of London, Ont., in discussing business conditions and the general outlook with SANITARY ENGINEER. "There has been a lot of building started recently and indications are that there will be a lot more. As far as Ontario is concerned the situation is good and I am told that Western business has been very good.

One of the things which has tended to make conditions unsettled somewhat in Ontario has been the uncertainty existing over what the Ontario Housing Commission is going to do. It is time the Commission either did something itself or let somebody else do it. Men who have proceeded with the erection of dwellings were deterred from starting because they did not know whether if they started a row of cheaper houses built by Government funds would be erected alongside of theirs. The Commission has been busy for six months or more and there is nothing to show in the way of results. There is no question about houses being needed, and if it had not been for the uncertainty caused by the prospect of the Commission going ahead with something, others would have been busy long before now."

Prices Have Settled Fairly Well

Mr. Robb stated that with the possible exception of enamel goods he does not look for any reductions in prices for many months. It was not certain that enamel goods would be lower, but from reports he had had from the United States, some readjustment in prices might be made in from three to six months.

"There have been a good many readjustments in prices of plumbing goods recently," said Mr. Robb, "and I do not look for any further changes for some time."

Mr. Robb stated that he rather favors the "open price" system, which was outlined in the last issue of SANITARY ENGINEER, as a means of getting away from price cutting.

Getting a Fair Return

"There is no question that price cutting is one of the greatest evils in the trade to-day," he said. "Many a plumber has cut and slashed because he thought some other chap was figuring on the work in hand, only to find out that he had been cutting under himself. What the trade needs is to get away from this sort of thing. There is no need for it and the Ontario Association can do a good work in taking steps to eliminate it. One of the reasons for it is perhaps the lack of business training. There have been too many men start in with a kit of tools and a few supplies and no knowledge whatever of the principles of business. They go after contracts and cut prices to try and land the job, and then when they get it, and it is finished up, and things paid for, they discover they have been working for nothing. There is another factor in the situation also. The man who takes a job too low is going to try by every means he can not to lose on it, and that does not make for good workmanship or materials or for a satisfactory job. The plumbers are willing, if paid reasonably, to do good work, and they are entitled to a fair profit for their work. John W. Irvine, of Detroit, whose address was reported in last issue of SANITARY ENGINEER, is working along the right lines. The plumbers should put their business on a business basis and not work for nothing."

Maintaining Quality Proves a Winner

London, Ont., Firm Have Built Up Reputation With People of City and Surrounding Country—Pleasing Their Fellow-Workers—Good Materials and Good Workmanship Are What Count, They Say

This shows the bright attractive showroom used by Noble & Rich, London, Ont.

DOES it pay to move from a location on the main street to a residential street adjacent to the business section and within easy reach of all the main car lines? The experience of Noble & Rich, of London, Ont., indicates that quality in stock and workmanship, backed by aggressive business methods, will bring trade regardless of location. The firm moved from their premises on Dundas St., the main thoroughfare of London, to a residence on Queen's Ave., a block away, and have built up a big business. They converted the residence into a splendidly equipped show room and workshop. They still have a splendidly central location, which, for all practical purposes, is as good as the one they formerly had, and have greatly reduced their overhead expenses.

Quality the Standard

"Quality" in supplies and workmanship has been the standard of the firm. They aimed for the whole city and the people in the surrounding country to know that any goods purchased from Noble and Rich, or any work turned out by them, was first class. Probably no one appreciates this phase of the business as thoroughly as the plumber or steamfitter himself and it is a notable fact that Noble and Rich have built up a reputation for these qualities, not only with their customers, but with their fellow workers. Their stock is known as one of the best; their shop is splendidly equipped, not only with materials, but with capable workmen, to take care of the emergency job or the regular work. A status of this kind usually takes time to acquire, but once it is acquired, it is invaluable to the firm.

Applies Equally

In an interview with SANITARY ENGINEER it was made clear that this standard of quality was rigidly adhered to by the firm. It applies just as definitely to a small job as to the largest and most intricate installation. The job has got to be right and the customer satisfied. Price-cutting on contracts, so often attended by the most serious results, both to the firm doing the work and the customer, is one of the worst evils with which the trade has had to contend. Noble and Rich have had to meet it, not once, but many times, but by remaining true to their "quality" slogan they have won out. Not only won out, but gained a reputation that is standing them in good stead.

An instance of this price-cutting occurred while SANITARY ENGINEER was in the office. A householder had asked for a figure on a small installation and an opposition firm had given him a quotation fully $40 lower than the actual cost of the materials and the workmen's time. It was obvious that either the firm doing the work was going to stand a serious loss, or the job would be done with inferior materials and the proper workmanship skimped. Another bad feature of the case was that from the standpoint of the man wanting the work done, for a time at least it appeared that the "quality" firm was out to rob him. In cases of this kind, Noble and Rich have invariably found that it pays every time to figure

Keeping the Shop Men Busy Ten Hours a Day

Brosseau and Frere, of Quebec, Have No Idleness — Nineteen Years in Business Sees Big Growth—Proprietor Should Aspire to More Special Work —Why Not the Plumber for Electric Installation, Too?

FOR nineteen years Brousseau and Frere, sanitary plumbers and heating engineers, have been following their chosen line of work on St. Joseph Street, Quebec City. The story of this enterprise is one of progress, and the experience of Mr. E. G. Brosseau, under whose direction the plumbing and heating and the electric wiring and vacuum departments are placed, covers nineteen years of constant change. In the evolution of the venture from a very small beginning, in which $200 cash was invested, the firm has much satisfaction in the fact that it can now handle any type of contract, no matter what its nature and regardless of its extent. In support of this it is interesting to relate that the firm is now engaged on a $35,000 job in the city of Quebec. This work is in a large boys' school, and it will take several months to complete the heating, ventilating, electric wiring, vacuum system, etc. By being qualified to undertake the whole work, Brousseau and Frere were here able to tender for and to secure one of those contracts which, very frequently, are only sought by the very large contracting firms. And entailing a real risk, as such work does from the standpoint of being within one's proper estimates when the work is completed, Mr. Brousseau is satisfied that his contract will yield him a good profit.

Always a Student

To the representative of SANITARY ENGINEER who recently called on this firm, Mr. Brousseau said: "I have always studied and am going ahead with my studies still. Much of this study was secured in night school, and one can always keep busy learning something new."

Therein is surely one of the secrets of Brousseau and Frere's success. So many of us are content to take things as they are and to give way willingly to the temptation to stay in a rut, that it is refreshing when some have grasped the important idea that there is no standing still, that one must progress or retrogress. It takes time to give heed to new methods, to really evolve new ways of working out shop methods and so on, but here, as elsewhere the time and care taken in these respects pays well. In days of keen and still keener competition it is pretty sound advice to the plumber when a brother plumber attributes his own success to these principles as Mr. Brousseau does.

In following his studies, Mr. Brousseau has not confined himself to the one subject but to several. Thus he has kept well posted on such new innovations as vacuum heating and vacuum cleaning developments, as well as on electric wiring in its many branches. A big argument this when one considers to what extent methods have changed within the past ten years. It pays to be posted.

Time Sheets—Shop Orders

Time sheets are given each man. Mr. Brousseau says that this has been a good plan. It places every workman on his own responsibility and is thus a factor in developing greater self-reliance. It also distributes the responsibility, for if one man had to look after the correct time of several it would be a considerable task in itself.

In addition to this all material is charged as it goes out of the shop. For instance, if the fitter wants some fittings and valves, pipe or galvanized iron he is required to order it. This is considered an excellent plan. Among the advantages is the important one of getting no more material on the job than is wanted. A man is more likely to get on the job just what he wants and to thus prevent accumulations that would tie capital up and also make a big excess of material on the job With the order from each man filed away, a careful checking is also made possible—a most essential and necessary element in making accounting accurate, for careful checking alone will go far toward making a job pay.

Statements

It is important that accounts should not be permitted to accumulate. The plumber and steamfitter generally conducts a credit business, for, with work uncompleted, he has no claim upon a spot cash plan such as many other merchants have where actual delivery of goods is effected the day the order is received It therefore is essential that the closest possible attention and care be given to accounts, and herein again have Brousseau and Frere scored an important plan.

"We send out statements every day," said Mr. Brousseau. "This is, on contract work. It has the advantage of enabling the customer to check up on the material and work he is having done. It saves disputes arising, for when a man is kept closely in touch with the progress of a contract that he has given he is the more likely to make less dispute when the work is completed. It is highly important that these disputes should be reduced to the minimum."

Checking Plans—Working Hours

Among other things, Mr. Brousseau carefully checks over the plans that he has been given to figure on. He entrusts this work to none but himself. If an architect has submitted a plan that has flaws in it, in so far as the heating and sanitary arrangements are concerned, Mr. Brousseau calls his attention to them. Thus, frequently, it is possible to suggest changes that will make for the better working of a heating system or a battery of urinals or closets. It is well, this firm believes, to work in harmony with the architect, but at the same time not to hesitate to point out flaws or inconsistencies where these exist.

"We are keeping our men employed ten hours a day," said Mr. Brousseau. "This is agreeable to them, for they are paid accordingly, and as we have the work for them to do we are glad to have them put in the full day. They have been busy like this all winter."

Progress Coming

While the Brousseau business has had fair scope for its work, the firm recently decided to make changes that will enable them to handle work to better advantage. In doing this an additional space was secured facing on St. Joseph Street, and alterations are now being made. When completed the change will enable all classes of work to be handled in an efficient manner, and particular attention will be given the display of the fixtures and electrical goods which are carried. Private offices and display space are two of the points being given particular attention.

Mr. Brousseau indicated very clearly to the writer that he believed in going ahead and in keeping one's staff busy at all times. It was better, even, to keep men busy by paying the present high prices for material than to await lower markets. In this connection the company had recently bought a quantity of pipe and the market afterwards declined several points. Mr. Brousseau said that he would like to have had the lower price, but that he was quite satisfied as he had the material on hand to keep his shop active. It was the best policy, he thought, to keep the men going the full length of the day.

A considerable volume of business is done right along in the matter of electrical wiring. Contracts are taken for any or all of the work required in this connection, and a nice line of fixtures is sold. The same are considered one of the profit bringers of this business.

C. A. DUNHAM COMPANY, LTD.

The following bulletins are being distributed by C. A. Dunham Company, Ltd., Toronto: Dunham Radiator Trap, Dunham Home Heating System, Dunham Return Systems, Dunham Vacuum Systems, Dunham Heating Data, Dunham Blast Traps, Dunham Radiator Valves, Dunham Oil Separators, Dunham Air Line Systems, How to Instal the Dunham Home Heating Systems, Dunham Heating Story, and Dunham Medium Pressure Traps. Copies of these may be obtained upon request by readers of SANITARY ENGINEER.

Description of the Hot Water Heating Plant and The Low Pressure Steam Ventilating System in the New Technical School, Wentworth Street, Hamilton, Ont.

Written especially for SANITARY ENGINEER.

THE heating and ventilating plant as here described is now being installed by Adam Clark, Ltd., in the new Technical School at Hamilton, Ont. This building is the first unit of a group which, when completed, will occupy a block bounded by Sanford Ave., Wentworth, and Huron Streets. The property is approximately 400 feet wide by 610 feet deep.

The accompanying plan shows the general lay-out of the proposed buildings. That part of the drawing showing in heavy lines and with the area cross-hatched indicates the building which is now being erected.

This building is four stories in height and on each floor there are three standard class rooms, a large workshop or factory, lavatories, and stair and elevator enclosures. The second floor, as here shown, is typical of all floors.

The only part excavated under this building is that roughly indicated by the dotted lines on the block plan. In this basement there is to be installed the "Vento" radiators used for heating the fresh air, the individual electric fans used for driving the fresh air to the different parts of the building, the three hot-water generators or convertors, a hot-water tank, and the return pump.

The boilers are in a separate basement situated as shown on the block plan.

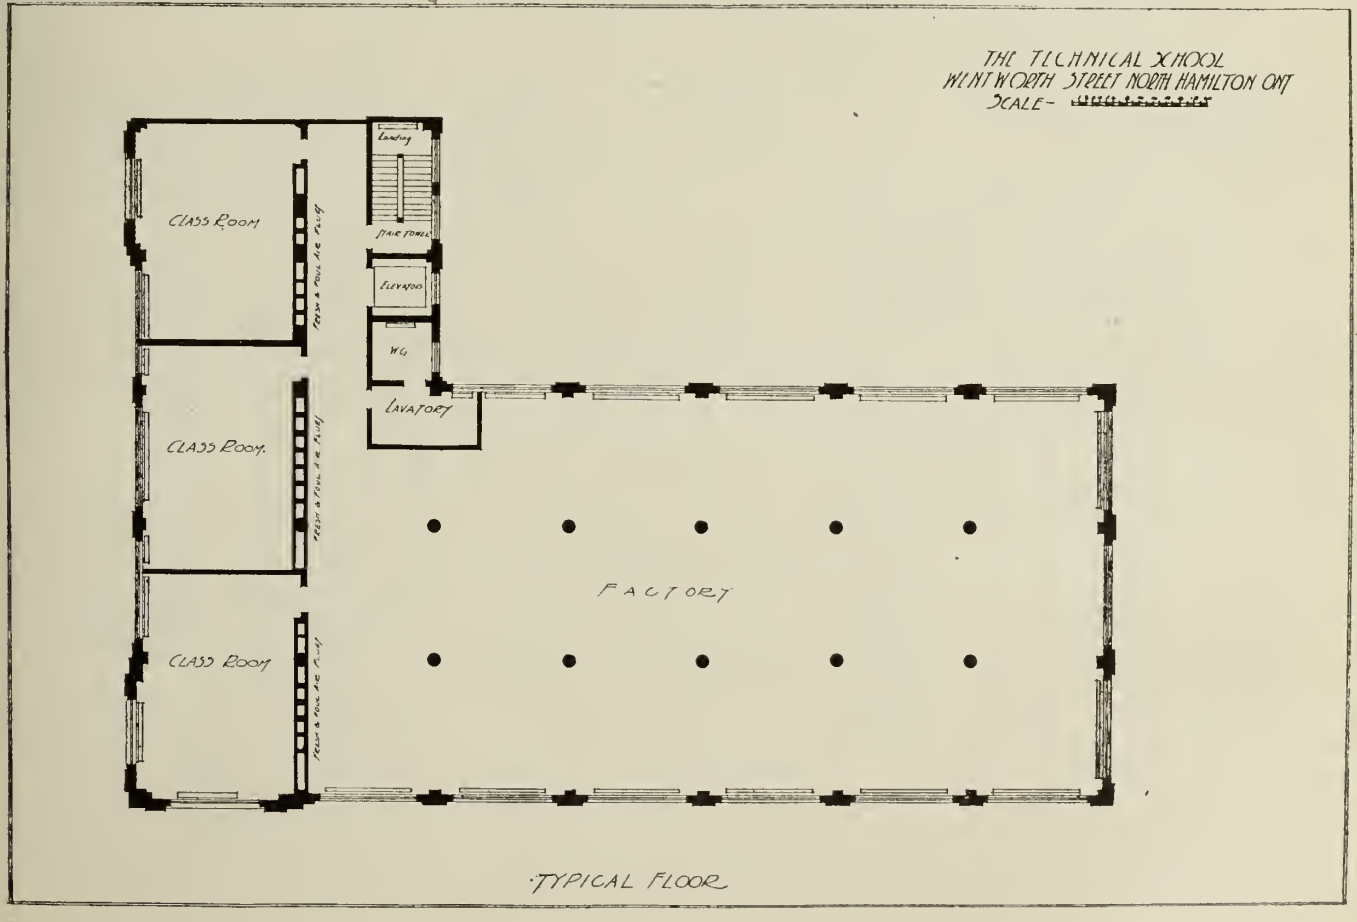
The ventilating portion of this plant is a separate and distinct unit of the equipment and is not to be confounded with any part of the heating system, with the exception that the steam used in the Vento coils is taken from the boilers connected to the heating plant.

The air for ventilation is warmed by steam-heated Vento radiators.

The heating of the building is by hot-water radiators. Three low-pressure water-tube self-feeding boilers, with a rated steam capacity of 8,000 square feet each, are set up by the boiler room and are connected by way of 6-inch heads to an 8-inch steam main running in a tunnel across to the basement under the school. The first branch off this 8-inch main is a 6-inch lead to the Vento coils. After the 8-inch main passes this 6-inch branch it is reduced to 5-inch and continues thus to the three convertors. This 5-inch main also has a 1-inch lead to the small convertor used for heating the domestic hot water.

The condensation return from the Vento coils is 3½-inch. The condensation return from the convertors is also 3½-inch, and these two returns are connected by means of a 4½-inch head to the receiving tank. A small electric pump drives the condensation back to the boiler through a 4-inch pipe.

The convertors are made up of brass or copper tubes and are constructed so that there is a "tube within a tube." The steam passes around the outer tube and through the inner tube and heats the water that is contained within the annular space between the two tubes. The water heats very quickly in the conver-



tors and the circulation that takes place is much the same as that in the ordinary type of boiler, the only difference being that steam is used instead of fire as a heat generator.

These convertors are fitted with feed and returns, just as are ordinary heating boilers, and connections are taken off in the usual manner with 7-inch feed and returns.

The three convertors are connected to a common feed head leading to a 5-inch main. The 5-inch main is carried through to the ceiling of the fourth floor, where it breaks into several branches leading to drop risers situated along the outer walls. In arranging the branches it was the aim to distribute the piping in such a way that the first radiator to receive a feed should be the last to return. The top of the 5-inch main riser is vented to an expansion tank situated in the pent house. The expansion tank is closed and it fitted with a 15 lb. relief valve.

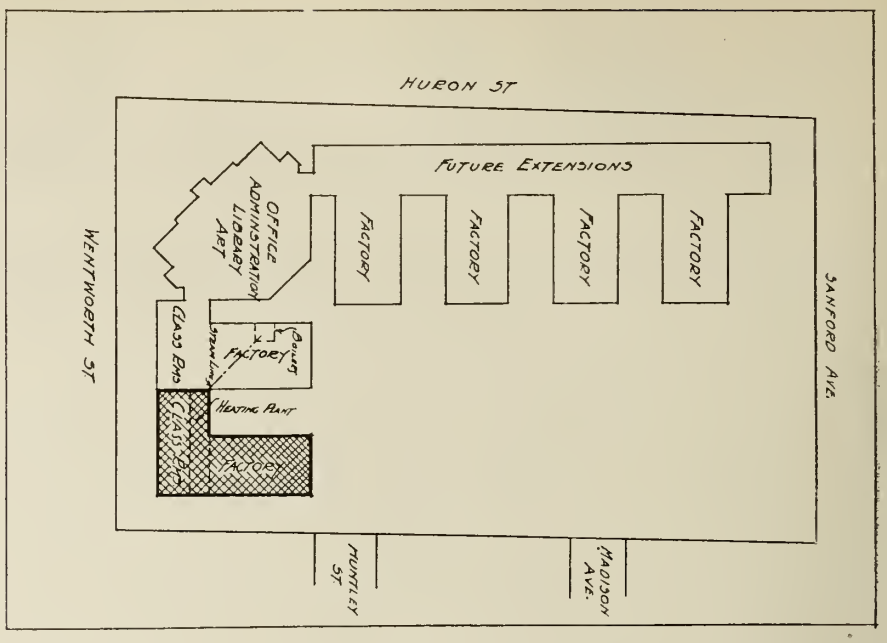
The feed and return risers are generally arranged so that each serves for eight radiators. Most of the feed risers have a load of 1,584 sq. ft., and are 2½-inch in size.

The largest feed to any radiator is 1¼-inch, feeding 225 sq. ft.

The radiators are of cast iron, generally from 44 to 50 sections in length, of the 3-loop type and 32 inches in height. They are all of the hospital pattern and are tapped at the top for feed and at the bottom for return at the same end. The return risers follow the lines and sizes of their corresponding feeds. The feet of these return risers connect to the return main which is run under the ground floor. At each corner and at other locations as required manholes with cast-iron covers are set so as to provide means of access and repair to this return main. The return main is connected to the convertors by way of connections of the same size as for the feeds.

The heating portion of this plant was laid out on the principle governing forced hot-water circulating systems, but as it is the intention to operate this system on the gravity principle it was decided to use piping a little larger than usually found in a forced system. A circulating pump could be installed without making any alterations to the plant, but with the static head that we have here a pump is not required. It is good practice when designing any kind of a heating plant where pumps are being used to make some provision for circulation when the power is turned off, and with a plant as here classified this becomes a simple detail.

It is the usual practice in forced hot-water heating systems to make use of a lock shield return valve to regulate the flow of water through any particular radiator. In this building an equalizing valve is to be placed on the feed end of each radiator. There is no valve on the return. The feed valve has two inner operating parts; one of these is in the form of an outer cartridge surrounding the valve. This cartridge has an opening similar to that of a quick opening valve; the size of this opening is graduated by an easy adjustment of the bonnet of the valve. If a radiator appears to be working so fast that there is danger of a short circuit being created it is a very easy matter to adjust the feed valve so that it will check that radiator off to the point required. This adjustment can be made without reference to the usual operating part of the valve.



Inasmuch as the system is self venting there will be no air vents on any of the hot-water radiators.

A rather unusual installation of ventilating fans is being made in this building. Instead of one large fan driving the air into a common distributing duct twelve small fans are being installed. Each fan is connected with the class room it serves and controlled from that class room, so that when a class is not in session the teacher can turn that fan off. Each fan is also connected by way of an individual duct to the plenum chamber situated in front of the fan.

Where the fresh air comes in at the back of the Ventos, deflecting dampers are to be installed to split the air currents up so as to supply an equal volume of air to all surfaces of these radiators.

The fresh-air intake is provided with a dust-proof screen, also an adjustable inlet damper.

The fresh air enters each class room through a diffusing face set 8 feet from the floor line. The foul air is taken from the room at the floor line into a vent flue, from whence it escapes above the roof. There will be no exhaust fans used in this work, but all vent flues will be fitted with check dampers.

There is a total of 1,336 sq. ft. of steam vento radiation used for ventilation and 15,956 sq. ft. of hot water for heating.

WINNIPEG WATER SYSTEM

In an effort to secure new industries for Winnipeg, special attention is directed to Winnipeg's great water system. Some of the engineering problems making possible the advent of Shoal Lake water are described as follows:

There are only four other communities in the world that have gone to a greater distance to secure their water supply than has Winnipeg.

The greater Winnipeg water aqueduct is one of the world's major undertakings. The length of the conduit is 96.5 miles. The water is brought to Winnipeg by the use of gravity. Difference in elevation Shoal Lake to Winnipeg is 294 feet.

To supply aggregate for concrete the greater Winnipeg Water district operated its own gravel pits and rock quarries, gravel crushing, screening and mixing plants.

Length of cut and cover concrete aqueduct with capacity of 85 million Imperial gallons per day is 77.5 miles.

Length of river syphons and pressure section of concrete aqueduct 7.1 miles.

Length of Red River tunnel constructed under the river with 5-foot cast-iron pipe lining 0.2 miles.

Length of 48-inch concrete pipe through streets of Winnipeg 2.3 miles.

The Water District operates its own railway, 110 miles long; owns its own locomotives and 115 coaches and cars, costing in all $1,439,622.27.

Reinforced steel used up to October, 1918, if rolled into rods ⅝-inch in diameter would stretch from Montreal to Regina.

Quantities of concrete used would provide 24-foot pavement 6 inches thick over 130 miles of streets, and would provide a concrete walk 6 feet wide wherever there is a sidewalk in Winnipeg.

The aqueduct crosses the Red River in a tunnel cut through rock 20 feet below the bed of the river.

Complete designs for all structures were made in Winnipeg and five to ten men have been employed making plans, analyzing and conducting field tests.

The cut and cover section of the aqueduct, 85 miles long, is so designed that the water will flow the whole distance by gravity without filling the structure to the roof.

Make Your Advertising Bring Results

Use Space Consistently—Field for Business Large—Give the News in Your Ads—Farm Trade a Factor—Get Your Newspaper Working

THE opinion seems to be held in many quarters that the average sanitary engineer, plumber and steam fitter is not an advertiser. There are many to whom the question of newspaper advertising presents no conception of the benefit which may be derived.

There are certainly benefits to be derived from the use of newspaper space and that many in the trade are using it successfully is quite apparent. Reproduced on this page are shown three of four typical ads which are being run by aggressive merchants, for when the plumber begins advertising the goods which he has to sell does he not step into the merchant's class?

It may be true, however, that the newspaper is not used as consistently and advantgeously by many as it might be. Some of those engaged in the sale of plumbing supplies look upon their stock as more or less inanimate objects which have no particular attraction for the consumer. It is to overcome this antipathy, if possible, that this short article has been prepared.

Field For Business Large

In the report of the housing condition which was just issued and some details of which appear in this issue, it will be noted that there are a very large percentage of houses even in the larger centres which are not supplied with a proper plumbing and heating system. This being the case, there is direct evidence that there should be more installations of bathrooms and furnaces and electric wiring and the best way to get your message to the householder is through the newspaper.

Farm Trade a Factor

In the smaller centres and to those who may be catering to a certain amount of farm trade the field is constantly increasing. The farmer to-day is perhaps one of the most prosperous men in the community, and he is looking around to see how he can make home life more desirable. The installation of a good plumbing system and water works system is not impossible and opens up a field for the aggressive sanitary engineer to develop. This trade is just in its infancy and to those who start early at the game and keep plugging away at it the results must come.

Give the News

The man selling plumbing and heating supplies has a direct appeal to make to his customers. It is not necessary then to be a special ad. writer. You have a message which, were your customer in your display room, you would have no difficulty in putting across. That is just what you want to get into your newspaper space. You have news to give your customers about the goods which you sell. That is what they want—real news, and to the man who incorporates this in his advertising the best results are almost sure to follow.

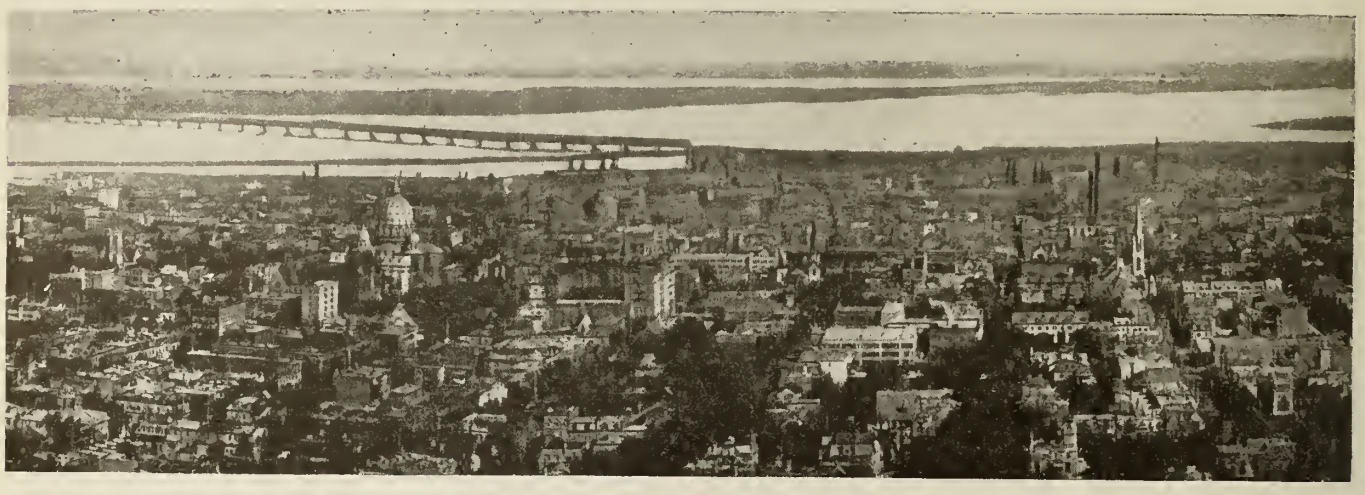
There may be a suggestion here. The use of an illustration helps out a whole lot. Advertising that is well done will bring returns—it is worth spending some time on.

Boost the Convention; Make it Hum

Get Back of Your Own Organization, the Canadian Society of Domestic Sanitary and Heating Engineers—Benefits to be Derived Many — A Fine Program— Come Prepared to Make Notes and Take Part in Discussions



Bird's-eye view of the Convention City, Montreal, taken from the mountain.

A PROGRAM of decided interest is being worked out for the annual convention of the Canadian Society of Domestic Sanitary and Heating Engineers, which will be held on June 3 and 4, in the Canadian Club Rooms, 101 Burnside Place, Montreal. The executive committee are to meet at 9 o'clock on June 3, and beginning at 2 p.m. the same day the regular sessions will be called.

That there will be something doing every minute of the time that is not only of interest, but of an instructive and profitable nature to every sanitary and heating engineer, is promised.

Conditions during the past year have tended to keep the members of the trade pretty closely associated with the shop. Now, with the war over and outlook improving, it should be a good time to get away from the grind and look over the situation. Get the other fellow's viewpoint and see how better results can be obtained in working out the problems arising out of the termination of the war.

Should Get Together

There is no place like a convention for getting together and talking over the problems of the trade. One of the great troubles with merchants in general is that they have a tendency to keep apart instead of pulling together. It is only by getting together and hearing what the other fellow's problems are, and how he gets around difficulties, that you can solve your own. There are many big problems that affect the whole trade. Matters of this kind can be threshed out at such a gathering as that in Montreal, and recommendations can be made that will be of benefit to the whole trade.

Apart from all this, every sanitary and heating engineer has a duty toward the trade. If he can help make better conditions it is his duty to do it. It has been proven by actual experience that the quickest and most effective way of benefiting the trade is through associations. If every member takes an active part, tremendous results can be accomplished.

Indications are that the convention will contain all the good features of previous sessions, and that several new ones will be added with a view of giving visible and practical demonstrations of how to handle important matters. There will be addresses by men who are in the closest possible touch with various phases of the plumbing and heating trades. They will discuss business conditions, the trade outlook, prospects of market conditions, prices and other points of keen interest to the members of the trade.

Should Come Prepared

Everyone should come prepared to make notes of everything that may interest them. There will be so many points coming up continually through the sessions, which will apply to the business of each individual, that unless he comes prepared with pad and pencil to make notes right at the time, he will miss many valuable suggestions. It is useless to try to trust to one's memory on an occasion of this kind. The only way to do is to make notes, and then they can be referred to afterwards and the whole subject may be recalled.

A gathering like that which is to be held in Montreal on June 3 and 4, affords a real opportunity that no man in the trade can afford to miss. The points that he will pick up in regard to conducting his business will alone repay him for the trip.

The conditions likely to prevail in the future regarding markets and prices is a vital one. The chance of meeting the other men and hearing them discuss their problems is worth while in itself. More valuable experience can be picked up in a short time in this way than the average merchant would gather in any other way in years. It is the men who are face to face with the business problems who can tell just what they have had to meet and how they met it. Many dealers have been surprised to find that the problems mentioned were often the very ones that they had been puzzling over and trying to figure out.

In writing of the objects of the Canadian Society of Domestic Sanitary and Heating Engineers, John Watson, the secretary, extends also an invitation. His letter reproduced in the April 1 issue of SANITARY ENGINEER read in part as follows:

"We are holding our Annual Convention in Montreal on the 3rd and 4th of June and would be pleased to have any of our craft who are legitimately carrying on the business of plumbing and heating at this meeting. We would much prefer that you establish a society in your city or town and then send some delegates to the convention, but if preferred any individual can join up with our society at a cost of one dollar for this year, all that is required is a letter from you on your letterhead paper making application for membership. We will then send you a copy of our by-laws and if you approve of our method of doing business the cost of same will be one dollar per member, which pays your capitation tax up to the Annual Con-

vention. Hoping you will seriously consider this matter as it is of vital importance to all in our business."

The more members any association has, the more powerful will be its influence, and the more widely it can be exerted. It is the aim of the officers to make the organization of real value and service to all members.

Start a Local Organization

It is not expected that every plumbing and heating engineer will be able to attend. For this reason the present body urges the formation of a local body from which one representative may be sent. In speaking of the need for proper organization so that sanitary and heating engineers may work together to uphold their trade in the problems of the day, J. E. Walsh, Montreal, the vice-president of the Canadian body, has this to say:

"What are sanitary and heating engineers doing to further the cause of demobilization? Are they, like other associations, strengthening their ranks and preparing themselves to take their proper places in the universal reconstruction? The question must be answered by the individual. Are you a member of a local organization? Or, if there is no organization in your locality, are you endeavoring to do your share in forming one? If there exists an association in your city or town, do you not feel that the present demands for co-operation leave you no choice but to seek membership? And if an association does not exist in your neighborhood, do you not realize that you must become willing, even anxious to co-operate with your confreres in forming one? In either case the remedy is simple.

Get Assistance Here

"In the large cities of every Province there are sanitary and heating associations, whose members are only too pleased to add to their numbers, as well as to assist smaller cities and towns in forming similar organizations. Some Provinces, moreover, are fully organized as Provinces. Ontario and Saskatchewan are the leaders in that respect and their members openly acknowledge that, to their organizations, they owe the prosperity and efficiency of their trades. The city of Toronto, in the opinion of many, boasts the most thoroughly organized and modernized society. Its genial and energetic secretary, Garrett Frankland, makes it both a pleasure and a duty to extend to fellow craftsmen of his own or other Provinces the benefits of his experience, and is at all times prepared to supply them with any literature or advice tending to encourage and assist in the establishment of locals.

"The city of Montreal has, likewise, a splendid association, whose president, T. Latourelle, and secretary, John A. Gordon, are only too happy to be of assistance to the sanitary and heating engineers of other towns and cities."

The advantage of men in the same section of trade getting together, meeting one another, and talking over matters of mutual interest, cannot be overestimated. It engenders a spirit of co-operation throughout the whole trade, which makes for beter conditions and better business. The effects are not only immediate, but permanent. It is something like dropping a stone in a pond. The circle is ever-widening, and in this case it is an ever-widening circle for the good of the trade. While good results immediately from gatherings such as will be held in Montreal, the benefits are spread over months or even years.

CONVENTION BRIEFS

Remember the date, June 3 and 4.

* * *

It will be in Montreal.

* * *

John Watson, 4145 St. Catherine St., Westmount, Montreal, is the Secretary.

* * *

Discussions are carried on in both French and English.

* * *

Make it a hummer!

* * *

Get together—It's good business.

* * *

You may have the solution of the other fellow's problem—he may have a solution of yours. You both benefit from meeting at Montreal.

MONTREAL APPOINTS CONVENTION DELEGATES

At the last meeting of the Montreal Master Plumbers, delegates were appointed to the June convention to be held in Montreal. The names of these are: H. Lavigueur, P. C. Ogilvie, D. A. Bethune, Telesphore Latourelle, James Ballantyne, Jos. Belisle, John A. Gordon. These are the accredited delegates of the association.

That the visiting delegates may be looked after, an entertainment committee was appointed and the personnel of this is: James Griffin, convenor; Walter Ryan, George Delaney, Mr. Lepine, and Arthur Noel. With this strong committee under Mr. Griffin, it is assured that the visitors will be made very welcome and that they will be well looked after.

During the open season for navigation, Montreal harbor is one of the busiest spots in the world. This shows a small section of the harbor with several ocean-going vessels loading and discharging freight.

Ontario Housing Committee Report

Standard Specifications Drawn Up—Permits and Licenses—Excavating—The Plumbing Details Outlined—What is Required in Heating—Electric Wiring and Installation of Fixtures

ONTARIO HOUSING COMMITTEE SUBMITS REPORT

The report of the Ontario Housing Committee recently issued makes known many facts hitherto perhaps hinted at but not considered so general. There is a wealth of revelation upon which SANITARY ENGINEER'S *readers can base a campaign for better heating and plumbing in the homes. The opportunity is here and now—better homes mean not only good business but a better citizenship. The report herewith covers the standard specifications as related to the plumbing and heating trades*—EDITOR'S NOTE.

WHEN the Ontario Housing Committee undertook to work out various types of houses conforming to their recommendations and standards, as given in the general report, it was recognized that the full value of their suggestions would not be realized unless more or less complete working drawings and specifications were prepared, illustrating and describing various types of construction.

The committee felt that this was especially desirable in view of the fact that less than ten per cent. of inexpensive homes have the benefit of architectural supervision.

It will be readily understood that the task of preparing complete drawings illustrating all types of construction would be a very serious undertaking. The drawings, therefore, indicate general layout only, with governing dimensions, location of special items, such as plumbing fixtures, electric outlets and typical details of doors, window frames and sash and special fittings.

The specifications have been prepared as a guide in determining the general trade classification and standards of materials and workmanship. It will be noted that in the suggestions for general conditions, as well as in trade specifications, the supervision of the contract forming part of an architect's service has been delegated to the owner. This has been done for the purpose of directing the owner's notice, where an architect's services are not available, to particular items requiring attention.

Too much emphasis cannot be placed on the need and desirability of the services of a competent architect.

Where a development involving the construction of a number of dwellings is contemplated it will always be possible as well as advisable to secure the advice of an architect. The Ontario Association of Architects has expressed its willingness to co-operate in improving the design of small houses by providing drawings at a nominal cost to assist the builders of individual dwellings.

General Conditions—Permits and Licenses

The contractor for masonry shall secure all permits and licenses necessary for the execution of the entire work excepting plumbing and electrical work, and shall pay the lawful fees therefor, and the same shall be included in the contract price. This contractor shall give the proper persons all requisite or desirable notices relating to the work, except as noted above. Fees, permits and licenses for plumbing and electrical work shall be paid for and obtained by contractors for those trades.

Water Supply

Water supply shall be arranged for by the contractor for masonry, who shall obtain permits, pay fees, and install the construction water supply system, extending same to convenient points about the premises. Water rates shall be paid by this contractor throughout the progress of the work.

Excavating—Lines and Levels

The contractor for plumbing will establish lines and levels for all excavating in connection with plumbing work.

Work Included

This subdivision shall include all excavating of whatever nature required for footings, walls, piers, temporary and permanent drainage system and water supply or other piping, all baling, pumping, bracing of banks, care of pipes and conduits, all back-filling and grading to levels indicated.

Plumbing—General Conditions

The general conditions pertain to all trades and form a part of this specification and the contract, and shall be carefully read and adhered to by this contract.

Work Included

This sub-division shall include the furnishing and installing complete of all stacks, drainage, vents, service water, fixtures, etc.

Materials and Workmanship

The entire work shall be executed as described under paragraphs of description, instructions, requirements, etc., using particular materials and apparatus as specified under the following headings: Pipe and Fittings—Valves—Ferrules—Soldering Nipples—Floor, Ceiling and Partition Plates—Drains and Traps—Cleanouts—Painting—Fixtures.

Relation to Other Trades

This contractor shall confer with all other contractors whose work may affect his installation, and arrange his equipment in proper relation with the building construction and the architectural finish. Special care shall be taken in the installation of all equipment where same is to be concealed, to see that it comes within the finished lines of floors, ceilings, partitions or walls.

This contractor shall notify all other contractors of all openings, anchors, hangers, excavating or other provision necessary for the installation of his work, and shall furnish such anchors, hangers, etc., and information regarding openings and excavating in ample time, so that proper provision can be made for same. Failure to comply with this requirement on the part of this contractor will not relieve him of the cost of cutting for openings, installing anchors, hangers, etc., and excavating at a later period, and the subsequent patching, backfilling, etc., thereby required.

Certificates, Fees, Etc.

This contractor shall give all necessary notices, obtain all necessary permits, and pay all fees in order that the work hereinafter specified may be carried out, and he shall furnish any certificates necessary as evidence that the work installed conforms with the laws and regulations of the city and province in which this work is carried on.

Guarantees

This contractor shall guarantee all material and workmanship used in the work to be of the best quality obtainable in strict accordance with the specifications and free from any defects. Any defects which may appear in any of the work within the year after the acceptance, ordinary wear and tear excepted, shall be repaired and replaced by this contractor without any additional cost to the owners. Where such defects occur, this contractor shall be held responsible for all costs incurred in making the defective work good, and all injuries to plaster, wood or other finish, caused by such replacements and repairs of defective work, shall be replaced and repaired in first-class condition by this contractor at his own expense.

Description of System—Sewerage, Drainage and Waste

This system shall consist in general of a house sewer line starting at the street sewer and continued into the building under the basement floor, with running trap, fresh air vent and branches from same carrying off all sewerage, drainage and waste from all plumbing fixtures and risers, floor drains and all

other apparatus requiring drain connection. Soil and waste branches from fixtures throughout upper floors shall be connected through branch lines into risers discharging into house sewer.

Vents

Back vents shall be provided from all fixture traps, such vents to be carried to a point three (3) feet above the roof line, or joined to soil or waste stacks above the highest fixture connection. The bottom of all vent stacks shall also be joined to soil or waste stacks below the lowest fixture connection.

Service Water

A connection shall be made to the water main and run underground to a point inside the building, where a stop-cock and drip shall be installed. The line shall be continued from this point to the fixtures, including hot water boiler. From the hot water boiler a line shall be run to the sink (laundry tubs when tubs are indicated), basin and bath.

Standard Requirements—General Instructions

This contractor shall be held responsible for all measurements throughout and for any alterations necessary in the arrangement of pipes or the location of same in order to make them come within the finished lines of wall or ceiling. No pipe fittings or work of any kind shall be covered up or hidden from view before it has been examined and approved by the owner. Soil, waste and vent stacks, water leaders and water risers shall be true and plumb.

All soil or vent pipes where they pass through the roof must be properly flashed with 5-pound sheet lead or 16-ounce copper and made watertight. That portion of metal resting on roof must be at least 20 inches square, and that portion extending up pipe, if used, must be 10 inches high.

In addition to the points specified or shown, shut-off valves shall be provided wherever necessary for the proper operation of the system.

Where reductions in pipe sizes take place at fittings, reducing fittings must be used. Bushings will not be accepted.

All off-sets in soil, waste and vent stacks and lines shall be made with ⅛ bends, and any off-sets above the highest fixture shall be made at an angle not less than 45 degrees. Changes in direction shall be made by the use of proper fittings, as no screwed joints or bowed pipes will be permitted.

Connections between vertical and horizontal pipes shall be made with ⅛ and ¼ heads. Long ¼ bends and long T Y's may be used where their use is permitted by the Plumbing Regulations. Short ¼ bends, double hubs, short roof increases, straight crosses, double T's or double T Y's shall not be used on any part of the work. No branch fitting other than a full Y or Y and ⅛ bend shall be used on any soil or waste pipe running in a horizontal direction.

Lead pipe shall not be used for branches to any fixtures except the short lead connections to water closets and slop sinks.

All joints or cast iron soil pipe and fittings shall be made of packed oakum and soft molten lead well caulked. New lead shall be used in all cases for this work, and in no case shall old lead pipe and other materials be melted up and used. No putty or cement shall be used about these joints.

Cleanouts shall be provided in all sewers, soil stacks, waste and drain pipes at all points where obstructions may be formed. All such cleanouts shall be full size of pipe up to 4 inches in diameter and not less than 4 inches in diameter for larger pipes. Cleanouts shall be gas-tight and accessible.

All joints necessary in lead pipe and between lead pipe and brass fittings shall be wiped solder joints. Connections between cast iron soil pipe and lead pipe shall be made by means of cast brass ferrules and wiped solder joints, the lead pipe being extended through the ferrule, and flange turned out and up the outside of the pipe, with the wiped solder joint at the outside of the ferrule.

Connections between wrought iron and lead pipe shall be made by means of cast brass soldering nipples screwed on to wrought iron pipe and wiped solder joints.

Connections between wrought iron pipes and cast iron pipes shall be made by caulking the threaded end of the wrought iron pipe into the hub of the cast iron pipe.

Connections between wrought iron vent pipes and cast iron pipes shall be made by means of cast iron fittings with branch tapped for iron pipe size.

All joints in wrought iron pipe shall be made with screwed joints set in red lead.

Current Events in Photograph

One of the chief ambitions in life of the Bolsheviki seems to be to wreck and murder. This junk pile shows how costly locomotives were deliberately wrecked. The men on guard are British bluejackets and the scene is at Soroka, on the Murmansk-Archangel Railway. This wreckage is a very mild sample of what usually happens when the Bolsheviki are in charge of things.

Connections of brass pipe and between brass pipe and iron pipe shall be made by means of screwed joints, the threaded connections on brass pipe to be the same as iron pipe threads for pitch and taper. No slip joint couplings will be permitted on sewer side of trap. All traps shall be well supported and shall be true in respect to their water levels and shall have a seal of not less than 1½ inches. No lead traps will be allowed on any part of the work.

Drain, Soil and Waste Connections to Fixtures

All fixtures throughout shall be connected to waste, soil or drain lines, with branches and traps of not less than the following inside diameters:

Water closets	4 in.
Basins	1¼ in.
Sinks	1½ in.
Baths	1½ in.
Laundry tubs	1½ in.
Floor drains	4 in.

Vent Connections to Fixtures

Vent shall be installed for each trap throughout the work. These vent connections shall be made through branches of not less than the following diameters:

Water closets	3 in.
Basins	1¼ in.
Sinks	1¼ in.
Bath tubs	1¼ in.
Laundry tubs	1¼ in.

All branch vent connections shall be made as near the trap as possible. No trap vent pipe shall be less than four inches, inside diameter, where it passes through the roof, and all vent pipes must continue to rise after leaving the trap and pass out through the roof or connect with soil pipe above the highest fixture. Where they are required to be increased they shall be increased at a point not less than 1 foot below roof line, by means of an increase not less than 9 inches long and extended the required height above the roof line in the larger size.

Hot and Cold Water Connections to Fixtures

Branches for hot and cold water shall be provided to individual fixtures requiring water. These connections shall not be less than the following:

Supply Branches	Less than 20 lbs pressure.	More than 20 lbs. pressure.
Water closets	¾ in.	½ in.
Basins	½ in.	½ in.
Bath tubs	¾ in.	½ in.
Sinks	⅜ in.	½ in.
Laundry tubs	¾ in.	½ in.
Main supply	1 in.	¾ in.
Hose connection (if any)	1 in.	¾ in.

The branch connection from the flush tank to the W.C. bowl shall be 1¼ inch in all cases.

Service pipe shall in all cases be one size larger than the tap in the street main.

Pitch of Piping

The house drain and all horizontal lines of rainwater leaders, and all soil and waste piping, shall be graded in the direction of flow, with a pitch of not less than 1 inch in 4 feet.

All horizontal branches of vent piping shall be graded with a pitch of not less than 1 inch in 4 feet towards the fixture or fixtures to which they connect.

All horizontal branches of hot and cold water shall be so graded that they may be completely drained.

Securing of Pipes

All vertical lines of piping shall be firmly supported and held in place by iron pipe hooks or straps placed immediately below the hubs, couplings or fittings, and securely fastened to walls or floors.

Overflow for Fixtures

Suitable provision shall be made for overflows from all plumbing fixtures. and connections to such overflows shall be made in the waste lines on the fixture side of the trap.

Tests

After all drain, soil, waste, vents, hot water and cold water pipes have been placed in position and all branches installed, but before any fixtures have been set and connected, or the main house drain permanently connected to the sewer, the tightness of all joints and the soundness of all pipes shall be tested in the presence of the owner in the following manner:

Soil, Waste, Drain and Vent Pipes

All openings and pipe ends throughout the work shall be securely closed by means of approved plugs, and the entire pipe system shall be filled with water to the top of the highest opening, and this water shall stand at this same level for not less than two hours.

Another test shall be made of the entire plumbing system after the fixtures are set and the house drain connected to the sewer, this test consisting of turning the water into all pipes, fixtures and traps, in order to detect any imperfect material or workmanship.

Requirements for All Tests

If the tests as required above reveal any leaks or defects, such leaks or defects shall be repaired immediately and the tests repeated until satisfactory results are obtained. The above-mentioned tests shall not relieve this contractor from additional tests which may be required by any municipal department, under whose jurisdiction this work may come.

Standard Requirements—Pipe and Fittings

Sewer from street sewer to a point three feet outside the wall of building shall be 6 inches vitrified clay tile.

From this point all sewer, drain, soil, waste and vent pipes and fittings shall be standard weight cast iron.

Hot and Cold Water

Pipe except as provided for below grade shall be best grade, genuine wrought iron pipe, galvanized, as manufactured by . . . .

Pipe where buried underground shall be "Mark A lead pipe of size heretofore specified, weighing not less than 4 pounds 10 ounces per yard for ½ inch pipe, 9 pounds per yard for ¾ inch pipe, and 12 pounds per yard for 1 inch pipe.

Fittings exposed in toilet rooms or around in individual fixtures shall be cast brass fittings, nickel-plated or otherwise finished to conform with the finish of metal on fixtures.

Valves

Shut-off valves shall be brass of the globe pattern and shall be equal to those manufactured by. . . .

Ferrules

Ferrules shall be extra heavy cast brass, bell-shaped, and not less than four (4) inches long.

Soldering Nipples

Soldering nipples shall be of cast brass of first grade brass tubing, iron pipe size.

Floor, Ceiling, Partition Plates

Plates shall be of iron, finished for painting, and shall be used where pipes pass through floors, ceilings and partitions.

Drains and Traps

Floor drains shall be of the combined drain and trap pattern with cast iron bodies and strainers, similar to . . . 6 inches by 6 inches.

House sewer traps shall be extra heavy cast iron deep seal running traps coated with Asphaltum, with cleanouts and connections for fresh air vent.

See specifications for lavatories under "Toilet Fixtures" for fixture traps.

Cleanouts

Cleanouts shall consist of T.Y. or trap fittings, full size of the pipe up to four (4) inches in diameter and not less than four (4) inches for larger sizes. They shall be closed gas tight with extra heavy brass plugs screwed into heavy brass ferrules, caulked into the hubs of traps or fittings.

Cleanout plugs to have square nuts one (1) inch in height and one and one half (1½) inches square.

Cleanouts located below the floor shall be extended up and set flush with the finished floor.

Pipes, Fittings and Valves, Painting

All exposed pipes, fittings and valves, except where brass or nickel plated, shall be painted three (3) coats, first coat of lead and oil, and two (2) coats of graphite paint, color as directed.

All concealed pipes shall be painted one (1) coat of lead and oil.

Materials and Workmanship

Materials and workmanship as specified in the general specification for "painting" shall apply to this trade.

Fixtures

The following list of fixtures is not intended to restrict the choice of fixture to any one manufacturer. The selection is intended to suggest a standard quality and design suitable to work of this class.

All plumbing fixtures shall be in accordance with the following specifications:

Water Closets

Syphon-action bowls of an approved type, with low down oak varnished finished tanks. N.P. post hinge seat and covers, complete with brass floor flange.

Basins

18-in.x12-in. enamel iron basins, similar to plate J.R.700, with china index low down basin cks., and N.P. ⅜-in. brass supply pipes and 1¼-in. N.P. ½-in. S. trap.

Baths

5 ft. x 2½ ft. or 1¾ in. roll rim enamel baths, with china index N.P. double bath cks. Tail piece threaded for I.P. and N.P.C.W. and O.

Sinks

18 in. x 24 in. enamel roll rim sinks in one piece, with N.P. adjustable flange bibb for ½ in. I.P. and 1½ in. S. lead traps.

Range Boilers

30 gallon galvanized boilers, with 12 in. stands.

Laundry Trays

2 part cement laundry trays with plug and coupling iron stands, N.P. ½ in. compression bibbs.

Tray and Sink

Similar to F371 combination sink and laundry tray in one piece, with N.P. compression flange bibb and 1½ in. N.P. ½ S. traps to wall.

Heating, General Conditions

The general conditions pertain to all trades and form a part of this specification and the contract, and shall be carefully read and adhered to by this contractor.

Work Included

This subdivision shall consist of the furnishing and installing complete, of a gravity hot air heating system, all as herein specified, as may be required to properly complete the work.

Relations to Other Trades

This contractor shall confer with contractors for other trades and arrange his equipment in proper relation to the building construction, architectural finish, and other apparatus. Special care shall be taken in the installation where same is to be concealed, to see that it comes within the finished lines of floors, ceilings, walls or partitions.

This contractor shall notify all other contractors of all openings or other provision necessary for the installation of his work, and shall furnish such information ample time, so that proper provision can be made. Failure to comply with this requirement on the part of this contractor will not relieve him of the cost of cutting at a later period, and subsequent patching, etc., thereby required.

Certificates, Fees, etc.

This contractor shall give all necessary notices and obtain all necessary permits and pay all fees, in order that the work hereinafter specified may be carried out, and he shall furnish any certificates necessary as evidence that the work installed conforms with the laws and regulations of the city and province in which this work is carried on, and the requirements of the inspection bureau of the Canadian Fire Underwriters' Association.

Guarantee

This contractor will be required to furnish a written guarantee that the system as installed under proper management will heat the living room, dining room and bathroom to a temperature of 70 degrees F., and the bedrooms to a temperature of 65 degrees when the outside temperature is at zero.

This contractor shall also guarantee all materials and workmanship to be the best of the quality specified and free from any defects. Any defects which may appear in any of the work within one (1) year after acceptance, ordinary wear and tear excepted, shall be repaired or replaced at this contractor's expense, including all costs for patching or damage to other trades caused by such replacements.

IMPROVE THESE CONDITIONS! !

Another group of 113 houses was investigated. Small houses were more in evidence than in the first group, only two being of more than six rooms. Rooms were sub-let to roomers in 22 houses, and to families in 14. Owing to the tendency in the larger houses to sub-let it was noted that the number of persons per room increased from 1.00 in the four-room houses to 1.10 in those with six rooms. While a considerable proportion of these houses was reported to be in bad repair and insanitary, no definite statement was made as to the actual number unfit for habitation. Wet cellars were found in eight houses, in seven the roof leaked, and in four both the roof and cellar admitted water. In no case was there more than one bathroom or toilet, and 57 houses were without bathrooms, while 28 were without inside toilet. In the group of 235, only three houses (all three of the duplex type) contained more than one bathroom. There were no bathrooms in 79 houses, and in 47 cases the toilets were outside. —Extract from the Report of the Ontario Housing Committee.

Description of System

Heating shall be accomplished by means of circulated air heated by furnaces, each of at least (insert capacity required) cubic feet capacity. The heated air shall be supplied to various rooms in the most direct manner possible, through ducts and registers.

Fresh air supply shall be taken from an outside point and cold air shall be exhausted from the halls.

Sheet Metal Work

All ducts and flues shall be thoroughly stiffened and supported in place.

All pipes in basements shall be round, and where they pass through partitions or walls, shall be provided with collars.

All leaders shall be provided with dampers, and shall be tagged, indicating room it supplies.

All turns in leaders shall be made with elbows of not less than four pieces.

All stacks in partitions shall be oval or rectangular in cross section.

All hot air pipes and stacks shall be bright tin.

Cold air pipes or ducts shall be 26 gauge galvanized iron.

Furnace smoke pipe shall be 24 gauge galvanized iron.

All horizontal pipe shall have a pitch of at least 1½ in. to 1 ft.

Insulation for Stacks

All stacks shall be insulated with two (2) layers of asbestos totalling at least 1-16 in. in thickness. This asbestos shall be pasted or secured in other approved manner.

Standard Materials, Furnace

All furnaces shall be the product of a well and favorably known manufacturer.

Register Boxes and Registers

Register boxes and registers shall be provided at each outlet. They shall be floor or wall registers as indicated.

Register boxes shall have an iron frame to receive registers, and be fitted with louvres.

All registers shall be cast iron, japanned, square lattice pattern, and equal to those of . . . . manufacture.

Electric Wiring, General Conditions

The general conditions pertain to all trades and form part of this specification and contract, and shall be carefully read and adhered to by this contractor.

Extent of Work

This sub-division shall include the execution and completion of a complete system of electric wiring as hereinafter described and shown on plans together with the furnishing of all material, appliances, tools, scaffolding, apparatus and labor necessary for said execution and completion, except as otherwise stated.

Materials and Workmanship

The entire work shall be executed as described under paragraphs of instructions, requirements, etc., using particular materials as specified under the following headings:

Headings

Local switches.
Receptacles and plugs.
Plates for switches, receptacles.
Fuses.
Service boxes.

Relations to Other Trades

This contractor shall confer with all other contractors whose work may affect his installation, and he shall arrange his equipment in proper relation to the building construction and with the architectural finish. Special care shall be taken in the installation of the equipment where same is to be concealed, that it may come within the finished lines of the floor, ceiling or walls.

This contractor shall notify all other contractors of all openings, anchors or

other provisions necessary for the installation of his work, and shall furnish such information in ample time so that proper provision may be made for same. Failure to comply with this requirement on the part of this contractor shall not relieve him of the cost of cutting at a later period, and the subsequent patching, etc., and making good required.

Rules and Regulations

All work in this contract shall be done in strict accordance with the rules and regulations of the Ontario Hydro-Electric Power Commission.

Upon the completion of the work a certificate of inspection shall be obtained from the local inspector of said department. This contractor shall pay all the necessary fees connected with this work.

Location

The plans show the approximate location of all lighting outlets, but the price bid shall include the changing the location of any or all outlets to meet the exigencies of construction or design, as the owner may direct. No extras shall be allowed for such change of location, unless the distance exceeds ten (10) feet.

Description of System, Lighting

This shall be of a type to suit current available.

This system shall consist in general of the following:

Services shall in no case be run in less than ¾ in. conduit, which shall terminate immediately at the point of entrance in each house in an approved double-compartment main service box, one compartment containing the main switch and cut-out and the other the branch cut-outs, which shall provide for sufficient circuits to subdivide the outlets in the house as required by rule D, page 25, fifth edition of rules and regulations, Hydro-Electric Power Commission, and following paragraphs.

Number of Circuits

All lighting outlets in each house shall be on as few circuits as possible, but in no case on less than two. No set of lamps requiring more than 660 watts, where grouped on one fixture, or on several fixtures or pendants, shall be dependent on one cut-out.

Drop of Potential

The drop of potential from the street main to the farthest light shall in no case exceed two (2) per cent.

Standard Requirements, General Instructions

All wires and cables shall be installed in the manner known as "concealed knob and tube" work, which shall consist of wires supported by split porcelain knobs, securely screwed in place, where wires run parallel to joists or studs, and by porcelain tubes where wires pass though joists, studs, etc. Where wires are exposed they shall be encased in bushings of flexible tubing, projecting at least 3 inches beyond floor plate or bridging. All wires shall be run taut, in straight lines, parallel or perpendicular to the walls, and there shall be no kinks or slack places in the wire except where necessary to relieve bushings or joints from strain. To avoid possible strain there shall be provided a knob adjacent to each joint at each turn in the wire and adjacent to each outlet.

On vertical runs all wires shall be protected from plaster droppings by tubes which extend at least 4 inches above the horizontal timbers which have been pierced.

Tests

All wires are to be carefully tested out after building is completed and before finished floors are laid for the detection of errors in connection or derangements due to other mechanics at work in the building.

Inspection

This contractor is to conform to all rules and requirements as regards electrical inspection. He shall notify the inspector in writing before commencing the work, and shall make any and all changes or alterations in the work as may be required by the inspector without expense to the owner.

Responsibility

This contractor shall be responsible for all wires and connections until the building is complete and the work accepted.

Where more than one circuit is brought into the same outlet each shall be separated and tagged.

Outlets

Crow's foot supports shall be provided at all lighting outlets in walls or ceilings.

Wires and Cables

Wires must not be of a smaller size than No. 14 B&S gauge, except as allowed by law for fixture work and pendant cord, where No. 18 B&S gauge will be a minimum.

Standard Materials

Wherever materials are described under specific names it shall be understood that such name is only referred to as fixing a standard of their character and efficiency. All material required under this contract and specification, and the drawings referred to herein, shall be new and the best of their respective kinds. All workmanship shall be first class.

Local Switches

Local switches, unless otherwise noted, shall be push button single pole switches with mechanism mounted on a movable plug. Where two or more switches are located together they shall be installed in gang boxes. Switches shall be equal in quality to the . . . . detachable mechanism switches.

Receptacles and Plugs

Receptacles for wall or base plug shall be of the flush type with self-closed openings, and arranged so that extensions may be used with lamp sockets or plug receptacles by using adapters.

Any wall receptacle shown on drawings shall be connected to a separate circuit carried direct to the main cut-out box in the basement, and in no case shall they be attached to the lighting circuits.

Each receptacle shall be provided with a plug and an adapter. Receptacles and plugs shall be of an approved type.

Plates for Switches, Plugs, Receptacles, etc.

Each local switch and plug receptacle shall be provided with a solid brass face plate attached by means of two screws. Plates shall be provided with openings suitable to the mechanism which they conceal and shall be finished flush brass.

Fuses

A complete set of fuses shall be supplied and placed at the time of acceptance. All fuses shall be of a type as specified in the rules and regulations of the Ontario Hydro-Electric Power Commission.

Service Boxes

A service box shall be provided for each house as required by law, complete with meter loops to fit type of meter installed or required by municipality. Such box shall be equal in quality to the ——— service box.

NATURAL GAS ASSOCIATION TO BE FORMED IN CANADA

At a meeting of producers and distributors of natural gas held in Chatham some time ago, a committee was appointed to plan the organization of an association. The committee composed of P. S. Coate, manager Chatham Gas Company; W. F. James, general superintendent of the Union Natural Gas Company; R. L. Pattinson, manager General Pipe Line Company; T. P. Pinckard, president of the Windsor Gas Company, and H. L. Braden, superintendent of the Dominion Natural Gas Company, held their first meeting at Chatham, at which P. S. Coate was appointed chairman.

The committee have gone over a proposed constitution and by-laws for the new association, and an organization meeting will be held at the Tecumseh House, London, Ont., on June 18. Notices will be sent to those interested in the natural gas and oil matters in Canada.

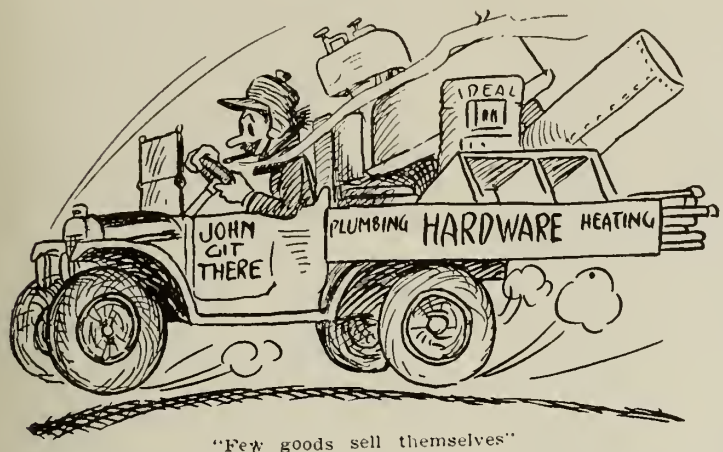
KINZINGER, BRUCE & CO., LIMITED

Catalogue "B-19," issued by Kinzinger, Bruce & Co., Limited, of Niagara Falls, Ont., contains forty pages, attractively illustrated, in which are listed the "K Niagara" lines, including soap dishes, tumbler and soap combinations, tumbler holder combinations, tumbler holders, tumbler and tooth brush combinations, tooth brush holders, sponge and soap baskets, bathroom mirrors, bathroom and robe hooks, roll holders for toilet paper, match holders and ash trays, bath seats, bathroom shelves, towel bars and racks, shower baths. Readers of SANITARY ENGINEER may obtain copies upon request.

How About Trade Expansion

Merchandise Which Sells Itself Contributes Little to Bank Balances—It is the Line Requiring Salesmanship Which Brings in the Desirable Profit

By ARTHUR HALLAM, Advertising Manager, Crane & Orderay Co., in "Hardware Trade."



"Few goods sell themselves"

VERY few goods sell themselves. The only ones that do are usually those things that are so universally used that every store carries them, and there is no profit in selling them. No merchant is fond of handling them, and only does so because he has to complete his line. Goods sold on price alone are seldom profit bringers.

It is the thing that has to be sold, that requires effort to dispose of it, which carries the comfortable margin of profit. Items like washing machines, gasoline engines, barn ventilators and equipment, and cream separators, that people feel they can get along without, do not automatically move out of your store. You have to put effort behind the sale of them. Here we see the old principle of following the line of least resistance. It is easy to sell goods that people come in and ask for, and there is a constant tendency to follow the easiest way. It has been proved by figures that few merchants make a big enough profit in proportion to the amount of capital they have invested in their business, and we believe this is one of the reasons. They are too much inclined to be satisfied with these "short profit" sales because they come easier. But the merchant who makes the money he can keep for himself is the one who pushed the "hard-to-sell" items. It is because these items are hard to sell that they carry the good profit.

All of which leads us up to the sale of plumbing and heating goods. Many people, especially in the rural districts, have gotten along very well without a central heating plant, or a complete plumbing system, and they feel that they can continue to get along without them still.

ANTICIPATE THE "BID" STAGE

Here is the whole point. Whenever you wait until a man decides of his own accord to build, he has very often already made up his mind as to what he wants. Then there is very little chance to do anything except go in and "bid" for the business, along with a number of competitors. The home builder gets so wrapped up in the price of the stuff that it is a hard proposition to get in selling talk to convince him that he ought to have more or better goods than what he has decided on.

On the other hand, if you analyze the market for plumbing and heating, you will undoubtedly find many homes and buildings only partially equipped with the different fixtures, and which are therefore prospects for more material. One reason why many merchants have not developed this business is simply for the reason that it takes time to work it up. For it is obvious that if the owner had realized the need himself for these things, he would have already bought them. This is the point where the advertising comes in. If you want to sell the owner on the idea by personal call, you will probably have to make a number of trips. Yet by sending out a series of letters to a well-selected list, you can develop the desire for the goods in the minds of your prospects to such a point that you can "close" sales after only one or two personal calls.

TAKE A CENSUS

It would not be much of a job to make a census of your territory to see what condition the heating and plumbing is in in the various buildings. You can do a little of it each day. And the beauty of this business is that when you develop it, it is yours.

No one else knows anything about it, and you don't have to cut the price way down to land the order.

How about the homes? Are they still using stoves for heating? If so, they ought to be "sold" on the idea of the advantages of a central heating plant. Do they still depend on an outdoor toilet? Then they need to be shown the advantages of a comfortable bathroom indoors. The same thing applies to home laundries. Many houses, especially those that have been built a long time, are not yet equipped with running water, laundry tubs, and floor drains in the basement. Are they still using the old flat rimmed sink, and getting their water with a pitcher spout pump? Then they need to have shown to them the labor-saving features of a handsome enameled sink and drain board, with a one-

"Then there is factory sanitation"

"The hard-to-sell goods carry the best profits"

piece back, and a small system in the basement to draw the soft water from the cistern.

TAKE A GLANCE AT THE SCHOOLS

How about the schools? Are the toilet rooms in them fit to be used by the rising generation? Are some of them still depending on dangerous and unsanitary outdoor closets? Are the lavatories and slop sinks so old that they can't be kept clean? Are all the floors supplied with bubbling fountains, so that the children can have plenty of good clean water to drink?

There is factory sanitation to be considered also, especially since so many women have lately turned to manual labor. Every community has at least one factory, and some of them several. Laboring people are growing restless, and one of the big reasons is that they do not have pleasant surroundings in which to work.

Men and women workers are entitled to cleanliness, and it is a good investment for a factory owner to provide clean, light, airy toilet, wash and dressing rooms for his employees.

MORE POSSIBILITIES

Comfort stations are another good advertisement for any city, especially if it is on a cross country highway. It is by such things that people passing through judge your city, and as they form their judgment, so will they talk about it to outsiders. The need of comfort stations, especially since saloons are becoming eliminated, has long been felt, and the plumber is surely the logical man to be interested in their development, because he will profit more than any one else.

Still another possibility is a local Y.M.C.A. or Community Club. A town of five thousand inhabitants can profitably support a Y.M.C.A., and if the town does not run that large, it can organize a Community Building. Such a building can be made a general community centre, to contain the offices of the Commercial Club, with stores on the first floor to help pay the rent, with athletic rooms in the basement, and billiard tables, lounging and committee rooms on the second floor. It often happens that an old building can be taken and remodeled for less than what an entire new building would cost. The plumber is interested in a movement of this kind, because, in addition to a good heating plant, such a building requires a generous amount of plumbing, such as bath tubs, urinals, showers, and closets, as well as a complete hot water supply system.

Another development that promises much for the future is the apartment house movement. Dwellers in the smaller communities are finding out how comfortable it is to live in quarters of this kind, so that shrewd real estate men are promoting more of these projects daily. These buildings are interesting to the plumber because they are always equipped with the most modern plumbing and heating materials.

The above are a few suggestions that can profitably be followed by any energetic merchant plumber who believes that this department of his business can be built up to a good volume of sales.

MARKET REPORTS

Continued from page 38

month, better than for some months in fact. The reduction in price has perhaps influenced the placing of some orders, but manufacturers see also in the movement an increased need for the material which all hope will continue.

Market in Scrap Metals Still Dull

OLD MATERIALS.—Little interest is yet markedly apparent in the situation on old materials. Dealers are not anxious to buy and there is no demand, the situation apparently hingeing on the outcome of the Peace Conference and the terms which may be made there. The steel situation in the United States is still in an unsettled state, too, and this is not tending to improve the general situation any. "Things are no worse or no better than they have been for some weeks past." That is the way the largest dealers in the district size up the situation. Dealers, however, are taking on such material as comes in at the prices shown below but they are not keen to buy. They have to take on quantities at times just to let the trade see that they are in the market for material, and sometimes in order to protect their name and credit. As a general thing they do not want to buy, even at the comparatively low figures now quoted. Some of the smaller dealers still have in mind the high figures they were receiving for their material during the years of the war, while the ultimate user has in mind the much smaller figure at which he may have to sell the articles for which he would buy scrap material. Between these two points there is a big gap, and it has not been bridged.

The steel mills and the foundries are not buying anything to speak of. In many cases they are pretty well filled up, and added to that the rate at which they are consuming material just now is much smaller than it was during the period of the war. Prices have not been changed at all during the last two weeks.

Dealers' Buying Prices—		
Tea lead	0	03
Heavy lead pipe	0	04
Pipe scrap	8	00
Stove plate, per ton	10	00
No. 2 busheling	8	00
Yellow brass	0	06
Red brass	0	08½
Light brass	0	05

No. 1 machinery cast	14	00
Heavy melting steel	9	00

Lower Tin Price; Lead Easier, Too

INGOT METALS.—Changes this week are confined to tin, which is down 3c, and lead, which has declined ¾c per pound. Business all the way through is considered good and present basis seems likely to hold for some little time.

COPPER.—A somewhat better tone to the market is noticeable at primary points. No quotable change is shown in price here, 18c per pound being the figure generally heard. Business is fairly good.

TIN.—A decline of 3c per pound has been recorded in this metal since the last issue, bringing the quotation down to 57c per pound. Business is fairly good.

Four-Page Bulletin Has Grown to 28

Retail Merchants of Kingsville, Ont., by Close Co-operation, Have Stimulated Business—An Auction Sale Plan That Has Produced Results—Merchants Provide Auctioneer for Farmers and Then Make Cash Sales to Them.

CO-OPERATION is the keynote that has spelt success for the Kingsville Retail Merchants' Association, resulted in a great business boom for the town, and stimulated retail trade in the community to an unprecedented degree.

It was in May, 1918, that business men of the town first gathered together to discuss the concrete proposal of organization of a retailers' association. The idea originated with C. W. Hendershot, of the firm of C. W. Hendershot & Co., Ltd., who, with other merchants, realized that while Kingsville, located on the shore of Lake Erie in Essex County, was a live business centre in the warmer months, owing largely to the influx of holiday residents from Detroit and large points throughout Western Ontario, it was practically "dead" by comparison, in the colder months of the year.

Extend Sales

Originally the organization was formed merely for the purpose of co-operative advertising with the definite object of reducing expenses, and getting home to the consumer in the surrounding country the retailers' sales message. No membership fees were charged, nor has this system yet been introduced, although within the near future this course is possible, as the association increases the scope of its work.

A four-page bulletin was issued advertising special values for the first Saturday in each month, and with a circulation of 1,800 was delivered to every resident of the town by carrier boy, and to every farmer through the rural mail delivery system, within a radius of nine miles. The nearby towns of Leamington, Harrow and Essex were also thoroughly covered.

Co-operation Counts

Robert Healey, of Healey & Crawford, furniture dealers, was elected president, and W. M. Webb, of Webb's gentlemen's furnishings, was selected as secretary, and by their indefatigable efforts, supported by the enthusiastic endeavors of the other merchants, have been largely responsible for the substantial success achieved in the first twelve months of operation.

Immediate Results

Results from this spirited co-operative sales program and business stimulator were immediately noticeable. Farmers and townspeople who had seldom before visited the town began to call on the special sales days, to take advantage of the real bargains offered. Prior to each issue of the bulletin, a general meeting of the merchants was held, the campaign discussed, suggestions received and reviewed, and a canvass was made for advertisements.

ROBERT HEALEY

Kingsville, Ont., president of the Kingsville Retail Merchants' Association.

An Original Feature

Within a short time, a further original feature was introduced whereby visitors to the town were invited to bring with them goods of any description they wished to dispose of. An auctioneer was provided by the association, and a general sale conducted on the federal square in the heart of the business district, where the produce or manufactured articles, of whatever nature they might be, were sold to the highest bidder without cost to owner. No commission was charged, and everything from live stock and horses to farm produce, furniture, household furnishings and commodities of every description were bought and sold. It was literally a free exchange.

Get the Cash

Nor do these public sales militate against the regular business of the furniture dealers and other merchants. Rather the opposite was the case. With ready cash in their possession, gained from the disposal of goods which, to them, was without great value, the visitors turned their attention to actual wants that could be purchased first hand in the stores.

The regular monthly sales day and auction is now a regular feature, and the biggest business builder Kingsville has known in its history, according to the officials and members of the organization.

As is the case with every movement in its infancy, the Kingsville Co-operative Business Men's Association met with doubters and pessimists, but even the most gloomy and conservative have come to a realization of the outstanding and obvious benefits that have accrued to the business interests, and at the present time, approaching the anniversary of its birth, the organization comprises practically every live wire merchant in the town; and it is a significant fact that among its most prominent members and readiest and most enthusiastic supporters are included Messrs. C. W. Hendershot, C. A. Quick, and T. J. Salmoni, managers of the three largest stores in town, all dealing in general merchandise.

The bulletin, with a circulation of 1,800, consists of twenty-eight advertising spaces, four and a half by six inches each, which sell for three dollars an issue. No profits are turned back into the association, as the merchants participating in the campaign from month to month, buy their space at cost. They realize too, that to be successful they must offer real bargains and price reductions if the movement is to be continued and they are to gain lasting results from their association and co-operative sale program.

MARKET REPORTS

Continued from page 26

SPELTER.—Business is by no means heavy nor is it really fair, buyers being satisfied to work along pretty close to actual requirements. Stocks are not large. Price remains at 8¼c to 8½c per pound.

LEAD.—The market has eased away again and the quotations are down ¾c from the figures of last issue to 6½c per pound. Business is quite active and supplies ample.

ALUMINUM.—Conditions in this market continue quiet. Quotations nominally range around 40c per pound, with little interest shown.

ANTIMONY.—There seems to be more activity to the market at primary points and bookings for future delivery are quite plentiful. Locally there is a better feeling as a reflection of primary conditions. Price holds pretty steady at 8c per pound.

EDITORIAL COMMENT

THE VASTNESS OF POSSIBLE MARKETS

THE talk we sometimes hear about getting 100 per cent. of the trade in any given field is generally due, states *Printers' Ink*, to the inability of the ordinary mind to grasp the vastness of possible markets. The automobile business, for example, is so wonderfully successful, and the use of cars is so generally in evidence, that it is not uncommon to hear talk of saturation points. It is almost impossible to speak of any phase of the industry without using the words "millions" and "hundreds of millions." Can the layman in statistics be blamed if he believes that there cannot be much further room for expansion in the business?

For some time, indeed, it was said that the horse was on his last legs. But speculations in the decline of the horse were evidently premature. Astounding as is the development of the motor-car business, according to the *Commercial Car Journal*, no less than 85 per cent. of the United States' hauling is still done by horses. It is, therefore, likely that the horse will be with us for a while yet.

The same may be said regarding many other lines Especially is it true regarding the possibilites for sales of sanitary and heating goods. We have really not scratched the surface. There are unlimited opportunities in every community for every live merchant plumber who will analyze local conditions and needs, and who will go out after the business.

BETTERING CONDITIONS

THERE have been more reports in the past few months of firms shortening hours without reducing the pay of their employees, establishing profit-sharing plans, granting half-holidays, in some cases whole holidays, and taking similar steps, than appeared before in years. One of the changes brought about through the war is a difference in the attitude between many employers and their help. It would appear that many more changes of this kind are yet to come. England seems to be setting the pace and the rest of the world is falling into line. This process of bringing employer and employee closer together is not being accomplished without a good deal of industrial disturbance, but there seems little doubt that eventually it will work out so that there will be closer relations and harmony, that will make for better business. The question of bringing capital and labor together has been a big one for some time, but more progress is being made in solving it now than for a long time. One of the most encouraging factors in all that is being accomplished is the distinct tendency to make for better living conditions, better home life and more education. All these have been badly needed, especially in many of the big industrial centres. One of the best things the workers in England are doing is the gradual elimination of slum districts and the establishment of workers' villages where living conditions are in many instances almost ideal.

THE STEEL SITUATION

BECAUSE of the effects it will have on other business the steel situation in the United States is being watched with keen interest by thousands of merchants and manufacturers. The attitude that appears to have been adopted recently, that of not being particularly anxious to do business, is causing a good deal of comment. The steel firms have been very hard at work for some time, driven to capacity very often. They have made a great deal of money and some producers are reported to hold the view that if buyers are not anxious to do business at the lower prices recently quoted, the steel men can very well afford to wait until the public is ready to buy again and spend the time in putting their plants in shape. This idea, if carried out will, in the view of many, increase the problems of reconstruction rather than help solve it by the effects it will have on other business and especially upon investors. The investor does not need to rush into new ventures especially with so many offerings of Government bonds and securities. Just what might happen between the time the steel men reduced production to a minimum and got their plants going on a regular schedule again is very difficult to predict, but if other businesses were compelled to more or less adopt the same policy the general situation would not be improved any.

NEED PRACTICAL MEN

A COMMUNICATION from the Canadian Mission in London to the Canadian Trade Commission in Ottawa emphasizes the difficulties faced there in promptly securing business for Dominion firms unless these are represented on the spot by practical men acting for groups of industries or otherwise. Time is of importance in all the reconstruction orders now being undertaken in Europe, and the Mis-

sion states that business is invariably lost when they are compelled to cable for prices, descriptions or samples. There is keen competition for all the trade offering, and the Mission points out plainly that firms not prepared to be represented singly or by groups cannot expect to book orders. It would be a benefit to business men forming groups to bid for this export trade if they notify the Canadian Trade Commission.

CONDITIONS THAT FAVOR BUSINESS

THERE was a tendency following the signing of the armistice to hold back—to wait for prices to drop; merchants all over were conservative. Some to-day are sitting away back in their offices telling people things are quiet and prices must come down and missing the chance of their lives to move their stocks.

There is business within reach of the aggressive merchant—the farmer was never so prosperous—there are some retailers creating sales records this spring. Read what W. J. Carter, of Carter Bros., Picton, Ont., writes in the course of a letter recently received:

"Business is fine, and has every appearance of keeping up. The farmers are getting enormous prices for their calves and hogs. When the latter went to 18c last year, it was thought the utmost price had been reached, but they were paid 21½ cents here last Saturday. In the old days they would realize $4 or $5 for a month old calf, now they get $23.00. One farmer got $476.00 for four head of cattle last week. Verily, the farmers' lines are falling in pleasant places these days."

Isn't there some reason here to believe conditions should be good with the merchant? Are you out in the sunshine or glooming away back in the office where every day is dull? "Business is fine"—are you getting your share?

THE livest, biggest retail merchants are constantly on the watch for new ideas. Salesmanship is one of the greatest things in the world.

THINK of business in broader terms than your own store, your own street and your own house. All merchants have common problems and by getting together and deciding on a common basis of action they can usually solve them. Co-operation not only counts in business but it makes broader-gauged men.

SHORTER working hours and higher wages seems to be a popular demand all over the world just now.

IT IS no use advertising unless you have the goods, and no use having the goods unless you advertise.

WHAT OTHER EDITORS SAY

SECRETARY REDFIELD'S scheme to stabilize commodity prices on a lower level, through moral suasion exercised by an industrial board of review, is of no practical value. It was easy enough to boost prices during the war to stimulate production, and even to stop profiteering when one had a club to swing, but it is an entirely different matter to argue with a man that he should lower the prices of his wares just because you think they are too high, no matter how much justification there may be for your opinion.

The law of supply and demand, if it is allowed free scope, is the best regulator of prices.—New York *Globe*.

* * *

NO merchant nor town official who spends every year all that he can afford with the home paper—whether that expenditure is actually necessary or not—makes a wiser, more profitable investment. Some think they are giving the home paper something. On the contrary, the paper is earning every cent it gets and more—provided it is a paper worth picking up in the road. And if it isn't that sort of paper, it is usually the fault of the town in which it is published.

The average weekly editor usually has his all invested in his newspaper property. The investment generally represents from two to five thousand dollars. But it is worth more to a town than five times the amount invested in any other local enterprise. As a rule the newspaper represents to the outside world the town itself. Poor paper, poor town is the usual verdict. It is therefore to the interest of every town to support a good newspaper.—*The Canadian*, Parry Sound, Ont.

* * *

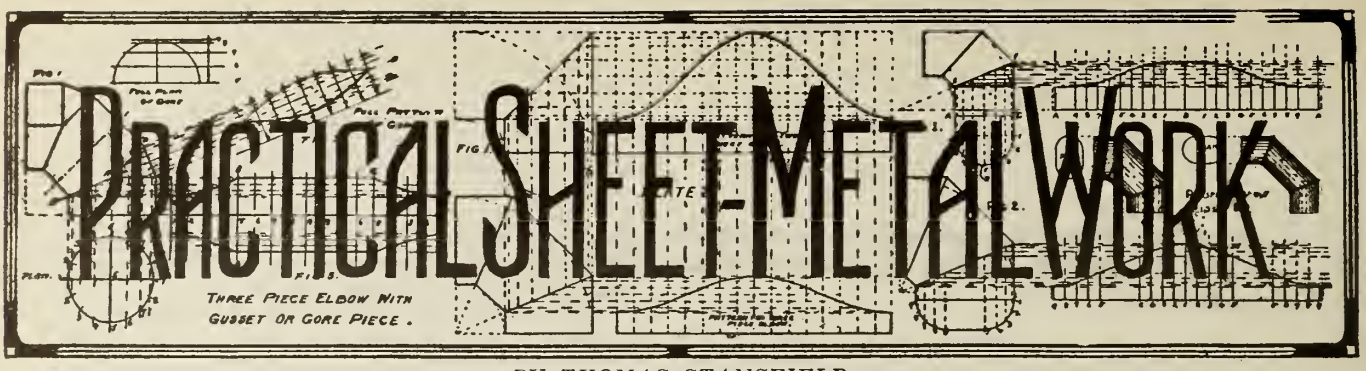
IT seems not to be certain that the plan for stabilizing prices is absolutely abandoned, so far as iron and steel products are involved in the restoration of industrial and trade activities. It is a matter of special interest on account of the exceptional condition of industry and trade on many lines at a time of such extensive readjustment as has been made necessary for getting back to peace conditions. In ordinary time of production and trade, conditions of demand and supply will of themselves work out the process of stabilizing, whether on a lower or a higher level.

The trouble now is that on many lines industry and trade were so put out of joint by the utterly exceptional war conditions that they cannot get back in the normal manner without a good deal of delay and of uncertainty in the movement on many lines.—*Journal of Commerce*, New York.

* * *

THE reason steel prices stay up is that the leaders in the trade are not hopeful that a large demand would result from a sharp lowering of prices. The term commonly used for such an attitude is "pessimistic" but the word is not appropriate, since it refers to temperament rather than judgment. The leaders feel that there is more money to be made by maintaining prices and squeezing out the last ton possible from existing contracts, at the same time receiving such orders as must be placed irrespective of prices, than by opening the market, negotiating with prospective buyers and finding the level at which they will take hold. Obviously it is of no particular consequence what level prices would reach in a decline, if the demand were strong enough to bring about an advancing market afterwards, for the steel trade must depend on averages, and when a dip in prices causes an upturn the tonnage sold at the lowest level is almost negligible.

Many men whose normal duty it is to sell steel do not hold to this view. They would prefer to see an open market, and chafe under the present restraint. They feel that if there were an open market the results in the long run would be satisfactory.—*The American Metal Market.*



BY THOMAS STANSFIELD

EDITOR'S NOTE.—Many letters have been received from retailers stating that the series of articles by Thos. Stanfield, on sheet metal work, have been of inestimable value to them. A large number of merchants have clipped the articles as they appeared, and have the complete series. Following is Article No. 44 of the series.

THE following article describes a method of pattern developing not taken up before. It might be termed shop practice, because of the fact that it shows how short methods can be followed, and, instead of developing the pattern on paper, it can be developed right on the sheet of metal from which the elbows are to be made. In plate 44 will be seen a handy article called a mitre plate, which, if prepared and kept on hand, can be used to advantage.

Before taking up the subject, it should be stated that every tinshop should have a good sized protractor, a steel T square. This can be easily made where there is a brake handy.

While this article simply treats with standard sized, or rather mitred elbows, the method can be adopted when developing any angle of elbow or offset.

Let us first assume that the pattern for a 2-piece, 90-degree elbow, and the diameter is, say, 3 inches, the mitre line will be 45 degress, and the height of the mitre will be the same height as the diameter.

Now add any length of line required for the depth of the throat, as shown on plate 45, Fig. 1. It will be noted that the curve of the pattern begins at the point where the throat begins.

Now, turn again to plate 44, and note how the protractor is used. Place the straight edge of the protractor against the edge of the T square and, with the 90 degree point in line with a perpendicular line, mark off the angle required. Seeing that a 90 degree, 2-piece elbow pattern, as well as a 2-piece 45 degree. or 3-piece, 90 degree elbow is described, we will develop those mitre lines used, and shown in plate 45.

It will be seen that the height of the mitre lines only is shown in plate 44, but no mention of the diameters is made. Now, turn to the "Handy Plate." The longest mitre is for a 90 degree, 2-piece

THROAT
REFER TO PLATE 44. WHICH SHOWS HOW THE TRUE HEIGHT OF MITRE IS DETERMINED. BY FOLLOWING THIS METHOD THE PATTERN CAN BE DEVELOPED DIRECT ON THE SHEET METAL
PLATE 45.

elbow, which is shown as being 7 inches in diameter; but suppose an elbow 4 inches diameter is required, the point of the compass is placed at A and opened to 4 and by drawing a line at right angles with line A and line X cutting line AG in the same manner as at B, the correct height of the mitre is procured.

The same course is followed if a 2-piece 45 degree, or 3-piece 90 degree elbow is required, by way of proving the accuracy in heights of the various mitres, measure the different ones, Figs. 1, 2, 3, 4, and 5 in plate 44, with the diameters and heights of mitres shown on the "Handy Plate."

Now turn to plate 45. Fig. 1 represents the diameter and height of mitre for a 3-inch, 2-piece, 90 degree elbow. It will be noted that the mitre is 45 degrees. We will now assume that ABCD is a piece of sheet metal and 1. B. 1. is the length of the throat, while 1. 11. A. is the height of the mitre. With point of compass at X draw a half circle and divided into any even number of equal parts as shown, 1, 2, 3 to 11, viz., 10 parts.

Now, divide the sheet with the measurements procured, beginning at 1.B. to 11, and from 11 to 1. D. and from each of these points draw a vertical line and intersect these lines by drawing horizontal lines from the points 1, 2, 3, 4 to 11 on the half circle ending at each correspondingly numbered vertical line, after cutting through the first of each line bearing the same number. It will be noted that only a part of the pattern outline is drawn, the rest is simply dotted where the vertical and horizontal lines cross. The curve shows how to cut with the snips; the dots are in practice really punch holes, so that in cutting with the snips the various points can more easily be followed.

Fig. 2 is a very similar problem except that it shows how the pattern for a 45 degree, 2-piece, or 90 degree, 3-piece elbow is developed of the same diameter as Fig. 1. On account of the mitre being less slanted, which would require too many lines being drawn horizontally across the piece of sheet metal, the half circle is divided into few parts.

It will be noted that while the height of the mitre for Fig. 1 is the same as the diameter, the half circle also represents a true half plan, but such is not the case in Fig. 2. The true height of the mitre in Fig. 2 is, however, the diameter of the half circle and by dividing the smaller into eight equal parts, the position of the horizontal lines is determined. But to find a true circumference which must represent the length of material required, it is necessary to draw a half plan.

It will be seen in this pattern that vertical solid lines are drawn to meet the horizontal lines and that dots are shown. By cutting from one dotted section to another, the material for two pieces is procured, from which a two-piece, 45 degree elbow can be made.

(Continued in next issue).

HOW TO SOLDER ZINC

Most Failures Due to Overheating Metal—Cleanliness a Requisite

"While it may not be generally recognized that sheet zinc, now so much used as a material for commercial work, is one of the easiest metals to solder, this fact is, nevertheless, true," says W. H. Hendricks, general sales engineer of the New Jersey Zinc Company. "Experienced operators claim that zinc is the most easily soldered of all sheet metals. Like anything else, however, in order to obtain good results, it is necessary that the operator be familiar with his work.

"Most failures in the attempt to secure joints of the desired length and quality where sheet zinc is concerned, are due to overheating the metal. This may occur from too long an application of the soldering iron or due to its being over-heated. As in similar operations on tin, other details also contribute to obtaining the highest efficiency in the work, but these can be easily mastered by any workman who is familiar with the general operation.

"Only a quick pass of the soldering iron over the metal is necessary to pro-

Heating and Ventilating

THE CHIMNEY

Third Article of Series Prepared for Readers of the "Sanitary Engineer" by N. A. Kearns

Editor's Note.—This article is the third of a series prepared especially for the readers of SANITARY ENGINEER, covering heating and engineering practice reduced to its simplest terms. Readers will find this article on the "Chimney" a most interesting and illuminative one. The first article of the series appeared in the April 1 issue. Descriptions of installations made in different classes of buildings will be given, together with the method used in making the designs for these installations. It is not our purpose to give complicated formulas, but rather to present the simple rules that have been based on these formulas, in such a way that the reader will be enabled to design a heating and ventilating system without having to refer to the data given in engineers' hand-books. The author of these articles, Mr. N. A. Kearns, has designed heating and ventilating equipment for all classes of buildings in practically every province of the Dominion. Some of the buildings were such that the heating and ventilating equipment had to be installed under the most adverse conditions, whereas in other buildings the design for the heating and ventilating equipment was incorporated in the constructional drawings. The fourth article of the series will appear in the next issue.

ALTHOUGH the chimney is one of the most vital parts of the heating plant, the chimney is seldom supplied by the party installing the balance of the apparatus. And if the heating contractor should complain of the faulty flue the owner of the building is sure that the heating contractor is working hard to provide an "alibi" for the poor work that is being done on the radiators.

Perhaps the reader might be able to explain why the worst kicker in the world will not kick at his chimney, nor at the man that built it. While everything else in connection with his building is a disappointment he is sure that the flue is all right. "His architect was no good, and it was necessary for Mrs. —— to practically design the house herself. Everything that appears to be right was designed by Mrs. ——, but that everything that is wrong was designed by the architect. Just look at the heating—look at those radiators under the windows—why we can't keep our curtains off them. I wanted them over on the inside walls out of the way, but the heating contractor went right ahead and put them in there and said that that is where the plans showed them and where he contracted to put them." And thus the householder goes on without a limit until he comes to mention his chimney. Then he no longer knocks, but becomes wildly enthusiastic about the wonderful man he had building his chimneys. He states that that man knows more about the building of chimneys and about the bricking-in of boilers than any other individual in the whole world. The man is a flue specialist and does nothing but build flues. He has been called in to consult with all of the leading scientists and it was only as a very special favor on account of some family connection that this owner managed to get this specialist to build his flue.

This picture is not a shade overdrawn. The reader must know from experience that nine-tenths of heating troubles are due to poor chimneys, but when you mention that fact to the average building owner he feels deeply insulted that any doubt should be cast on that dear friend of his—the chimney.

You may find nothing new in this article dealing with flues. So much has been written and so much talk has been wasted in trying to bring us all to a better understanding of the importance of the flues that one might be justified in believing that the subject had been exhausted. Perhaps it is not that we are ignorant of what a flue should be, but because of the blind worship that property owners give their chimney that we find it so difficult to get flues built in accordance with true scientific principles.

Now do not think because a building contractor is building for himself that the flue in his building is bound to be right. And if you are fortunate enough to get the contract for heating before the flue has been erected, be sure and watch that flue while it is being built. To show how much care is required in this connection we may quote of one case here in Toronto where the architect's plans show a flue 17 in. square. The flue as built was 17 in. square at the bottom and 17 in. square at the top, and for two seasons the owner condemned the boiler connected to that flue. The boiler manufacturers contending that the flue was at fault, and the owner persisting in the statement that the flue was all right, and just before a lawsuit was instituted by one of the parties interested the flue was opened and found to be 12 in. x 17 in. at a point 16 feet from the top. The bricklayer that had built that flue had already made an affidavit that the flue was 17 in. square throughout.

Over in Rosedale there is a large house that was built by one of the best known contractors in Canada for his own use. He afterwards sold that house, and the writer had occasion to examine the premises. We found that the flue to which the boiler was connected also served for two fireplaces, and those fireplaces had no dampers in them. This contractor insisted that the flews were not built according to our report, but he never could find time to come and see those flues for himself. The fireplace connections into the boiler flue were quite visible from the throat of either fireplace.

If the plan shows a flue of a certain size it is no indication that the flue actually built is of that size. Bricklayers are never so happy as when they are permitted to ignore a plan. They evidently believe that a plan showing a flue as being 17 in. x 17 in. or approximately that size does not mean anything of the kind but rather 23 in. by 23 in., or 13 in. by 13 in., or perhaps a sort of a composite of all of these sizes.

There is no man who has been in any way connected with the heating business for any length of time that does not know of scores of examples such as the above. The writer has actually seen

flues that were completely stopped up with brick and mortar while the owner was spending many uncomfortable hours trying to get a fire to burn in the boiler.

Be sure to see that the flue is high enough to establish the necessary draft. The draft, or the speed of the gas travel, through the flue, varies with the height of the flue, and the difference in the temperature of the gases in the flue and the temperature of the surrounding atmosphere.

It is usually assumed that in the ordinary flue with the temperature of the gases at about 500 degrees, the weight of the gas is about half that of the surrounding atmosphere at 60 degrees, thus, with this difference in weight the natural law of the pressure of a heavier weight counterbalancing the lighter comes into effect and the pressure of the heavy column of cold air pushes the lighter column of gas out of the chimney. If we assume a chimney 60 feet high we can consider that we have a column of 60 feet of unheated air that is to be used as a force in driving gas out of the chimney. Thus it follows that by increasing the height of the chimney we increase the height or weight of the counterbalancing force, thereby speeding up the draft, or we might put a fire in the flue and by raising the temperature of the flue gases induce a strong draft in this way. So now with these facts in our possession we know that if a flue is not high enough to establish the proper draft conditions fuel must be wasted to heat the flue so as to secure the necessary draft.

The standard draft condition for combustion in the ordinary heating boiler corresponds with the force necessary to raise one square inch of water two-tenths of an inch. Most heating boilers are built on the assumption that the flue to which they are to be connected will draw that much, so when you refer to the manufacturers' catalogue and find that a hot-water boiler with a capacity of 1,400 feet requires a 12 in. flue when the flue is only 30 feet high you must not assume that a flue 10 in. square will be good enough because the smoke collar on the boiler is only 10 in. in diameter. You must bear in mind that the 10 in. collar was based on a flue 60 feet high, and if you must use a flue 10 in. square it should be at least 60 feet in height. Most manufacturers' catalogues give us the chimney sizes required for their boilers, and it has been found that the best results with any type of boiler have been obtained where the flue has been of sufficient height to permit an area not greater than the diameter of the smoke collar on the boiler. Take good care to see that the flue is high enough.

If the top of the flue is at the same height as or below some of its surroundings it is sure to be subject to down drafts or horizontal air curls. If the flue is high enough for the proper draft (60 feet or more) and if difficulty is to be experienced in building the flue higher, down drafts may be prevented by the hooding of the flue. For illustration: A flue comes up on the west side of the building next to a lane. On the other side of the lane there is a much higher building, and when the wind is blowing from the east or west the chimney is subject to down drafts. To "hood" this a slab is placed right over the top of the chimney, and openings are cut below the slab on the north and south sides of the flue. Each of these two openings must be the same area as the flue.

In referring to the height of a flue we mean that measurement taken from the level of the grate in the heating apparatus to the top of the flue. It does not matter where the smoke pipe enters the flue, the height of the flue is always relative to the height of the grate.

A flue may be so large in area that it is impossible for the flue gases coming from a slow combustion boiler to supply heat sufficient to create the necessary draft. This condition is generally found where flues have been built for soft coal boilers and anthracite burning boilers have been installed. In this case the area of the flue should be reduced at the top, and the reduction should not be made at an angle of less than 60 degrees with the horizontal.

The writer prefers a straight, square brick flue, with struck joints and not plastered inside. When flues are plastered inside the plaster often falls out, pulling the mortar out of the joints and leaving air leaks in the walls. When tile or terra cotta pipes are used for flues, their joints are not always cemented tight enough to prevent the escape of gas from the flue or the leakage of air to the flue.

If two flues run up in the same chimney be sure to see that they are not connected together either in the cleanout chamber below or in the flue above the smoke collar. Be sure that there are no leaks in the partition between the flues. flues.

If a cleanout is built in the flue see that its door fits tightly. The cleanout should be on the inside of the basement and not on the outside as found on many residences. The door must be below the level of the smoke pipe opening.

See that the flue is not offset to make room for a fire place, or offset to avoid a joist, a beam or rafter.

If the chimney is built of stone see that the flue is lined with brick.

See that the smoke pipe does not go in too far, and that the thimble in the flue is tight, and that the smoke pipe fits into place without air leaks. See that all dampers swing freely, and if there is an automatic damper installed see that it is hanging properly.

See that there is enough air coming into the boiler room for proper combustion.

To save a great many heating troubles "watch the flue."

OUTLOOK GENERALLY SHOWS IMPROVEMENT

(Continued from page 12)

Another Manufacturer's Views of Outlook

Another manufacturer discussing the situation blamed the daily newspapers for creating in the minds of the public the idea that prices are high.

"The newspapers," he said, "are to blame for a lot of building being held up. They are inconsistent in their argument by urging that wages remain high and prices of commodities brought down. It can't be done. Building materials, relatively speaking, are low in price. They have not made anything like the advances that other things have. Take building materials and compare the advances made between them and farm products for instance. Pine lumber went up $20 per thousand feet, that in cold figures is an advance of 36 per cent. The wages of masons advanced 12 cents an hour or 22 per cent. Carpenters are getting 15 cents an hour more or an advance of 37½ per cent. Portland cement advanced in price approximately 54½ per cent. Now contrast these advances with some others. Between January, 1914, and January, 1919, wheat advanced 163 per cent. in Winnipeg and 149 per cent. in Toronto. Creamery butter at Montreal went up 86 per cent., hogs at Toronto were 84 per cent. higher, washed wool in Toronto was quoted at an advance of 196 per cent., and choice butcher's cattle 80 per cent. higher. In Montreal cheese went up 79 per cent. These are merely a few commodities that everyone knows about, and will bear out what I say, that speaking relatively, building costs are not high.

Aggressive Tactics Needed

"As far as the trade is concerned my view is that the plumbers do not go after business agressively. They are content, in the great majority of cases, to take what offers. Take Toronto for instance. There are 95,000 homes, and in fully ten per cent. of these dwellings the bathrooms should be taken out and new ones put in. It is up to the plumbers to do this. They can get the business if they go after it. They can take a leaf out of the book of the piano firms. They do not wait for the people to come into the store and buy. They go out and sell to the people. I am satisfied that the plumbers can do the same thing but they don't do it. Every woman likes to have a nice bathroom in her home and takes a pride in it if she has one. In too many homes, however, there is old plumbing and fixtures, and the woman has no encouragement to make the bathroom the equal of any of the other rooms. In homes where there are nice bathroom fixtures the woman takes as much pride in the bathroom as she does in the parlor. There is a big chance here for the plumbers to get a lot of business but, they must go after it."

HAMILTON MAY LICENSE PLUMBERS

At a meeting of the Hamilton, Ont., Police Commissioners held on April 30, the Civic Plumbing Inspector asked that a by-law be passed licensing plumbers, both masters and journeymen. He explained that this system had worked out very satisfactorily in Toronto and other places and would enable him to give better supervision to the work that was being done. The commissioners seemed to be favorable, and it was agreed that the city solicitor should be instructed to prepare a by-law for the next meeting.

News from Here and There

CONTRIBUTIONS OF NEWS GLADLY ACCEPTED

BUSINESS CHANGES

W. J. Cowie has opened a shop in Colborne, Ont., where he will conduct a plumbing and heating business.

R. Linnett, plumber and tinsmith, formerly of Brandon, Man., has opened an establishment at Indian Head, Sask.

The partnership between T. N. Meyer and his son, J. E. Meyer, who were in the plumbing, heating and sheet metal business under the name of T. N. Meyer & Son, of Neustadt and Ayton, Ont., has been dissolved. T. N. Meyer will retain the Neustadt end of the business, while his son is assuming control at Ayton.

CONVENTION IN CLEVELAND

The fourteenth annual meeting of the Natural Gas Association of America will be held at Cleveland, May 20, 21, 22.

NOTES OF THE TRADE

William Randall, for the past 31 years in the service of the Toronto Waterworks Department, as superintendent of maintenance and distribution, is leaving the city's service to become managing director for Canada of the Neptune Meter Co., of New York, who are establishing a branch plant in Toronto. Mr. Randall has done some very valuable work for the city, especially during the intake trouble some years ago, and he is regarded by Toronto civic officials as a man whom it will be very difficult to replace.

TRACTOR CO. LOCATE IN TORONTO

The Chase Tractor Co., with headquarters at Detroit, Mich., have opened a Canadian branch at Toronto. For the present the company will be located in the old Cluff Bros. munition plant on Atlantic Avenue, but later plan on securing a site at the Eastern Harbor terminal.

HOUSING IN WINNIPEG

Houses are so scarce in Winnipeg that even houses pronounced unfit for human habitation are being repaired and rented. The sanitary inspectors have to work continuously to ensure that the sanitary regulations are followed in any measure. The renting agencies are responsible for putting a house into proper shape, and as a general rule they do it, but often they do not, and then it is up to the sanitary inspector to make them. One family were unable to get any water for a week after they moved into their house. The water had been left turned on in many houses during the winter when they were unoccupied and the water pipes froze and burst. There is ice in the kitchens and bathrooms but the houses are being rented just the same. It is stated by the Winnipeg "Telegram" that up to the present the Federal housing scheme has deterred private enterprise from building houses as it would be competing against cheap Government money.

PUBLIC HEALTH ACT AMENDED

The Ontario Legislature which is at present in session has passed an amendment to the Public Health Act providing that when a city council orders the installation of sanitary conveniences in a house not so equipped it shall, through its clerk, be obliged to make an affidavit of the cost of such installations and the location of the property so assessed. When the tax has been paid a like certificate, stating that fact, shall be registered by the city clerk.

Among many other privileges granted to the City of Toronto by the Ontario Legislature, is that they are given the power to levy and collect against land annexed to the city, rates for the cost of any sewer constructed within the city before these lands were annexed in cases where the sewer benefits the lands.

GETTING READY FOR CONVENTION

Secretary Watson of the C.S.D.S. and H. Engineers, is a busy man these days. Between the onerous duties of his office in arranging matters for the June convention and the increase of spring work there is little spare time. "This strike," said Mr. Watson, "has not helped any. Why, some of our friends have even asked us to move their trunks for them, and we have done so. Then others want their gas stoves moved by our truck, and this is not so bad, it gives them an idea where to get these goods."

It is scarcely a regular thing to ask the plumber to move baggage, but his readiness to fill in at such a time but indicates the good-natured and well-intentioned servant that he ever is. Hurrah for the Dominion secretary!

The executive committee of the Canadian Society Domestic Sanitary and Heating Engineers met on Friday, April 25. Secretary Watson reports that encouragement is already coming in from the Quebec plumbers in particular. Applications have been sifting in for membership, and this means that interest in the work is being awakened, and that augurs well for a better convention. Every member should do his best to place this convention head and shoulders above any that have yet been held, thinks the executive. Individual effort should be exerted to the limit to be productive of the better results. Combined, they will mean a big force and make for success.

At this meeting, the entertainment committee, Jas. Griffin, chairman, conferred with the executive, and plans are well in hand, it is understood, for suitable entertainment of the visiting delegates.

THE PRESIDENT'S DESK

Since his death in the year 1900 the desk of the late James Robertson, founder of the James Robertson Co., Ltd., has been kept in his office, just as it was in the lifetime of this active executive, whose business was founded in 1857.

In the above year, the late Mr. Robertson came to Canada to establish a branch for an old English firm, manufacturing white lead, colors, lead pipe, and sheet lead. Eventually, Mr. Robertson purchased the business of the firm he came to Canada to establish. One of his first purchases in the way of office furniture was that of a massive office desk made of walnut. This, naturally, had many special associations for him as the years passed, and was much prized by him. After his decease, the desk was not removed from office. The association of the desk with the late Mr. Robertson's executive life was so close that the officers have retained it in its original condition and location, as if waiting to perform still, the bidding of its old associate.

CIVIC COMMISSION WANTS ADVICE OF MASTER PLUMBERS

The Administrative Commission of the City of Montreal paid a deserved tribute to the plumbing trade when they asked the Montreal Master Plumbers' Association to appoint a committee of three to act in an advisory capacity in connection with the framing of the new Montreal Building By-laws. These are very extensive and cover a very wide field. Naturally, there is no feature of these laws which is more important and of greater consideration from the citizens' standpoint, than that of sanitation and heating. It will, therefore, be gratifying to the plumbers that their advice has been sought in this way.

While the new by-laws, as far as

plumbing and sanitation are concerned, have been in preparation for a long time, after full consideration it seems to have been wise to postpone them a little longer that they may be complete. Covering all building requirements, the plumbing by-laws, though about completed now, will have to be held over until the whole draft is ready to receive the assent of the administration. The new by-laws will, it is now stated, be operative on and after January 1st, 1920.

OPPORCHUNITY

As the pote says,
"Opporchunity knocks at ivry man's dure wanst.
On some men's dures it hammers
Till it breaks down the dure
An' thin it goes in and wakes him up
If he's asleep,
An' ever afterward it works for him
As a night-watchman.
On other men's dures it knocks and runs away,
An' on the dures iv some men it knocks
An' whin they come out
It hits them over the head with an ax.
But ivrywan has an opporchunity."

MAKING YOUR ADVERTISING WORK

(Continued from page 17)

Quality and Personality

There should be also a quality appeal on which you could direct attention to the goods that you have to sell. There is also the personal appeal, and this is illustrated quite well in an ad. which has come to the writer's attention. This merchant, who terms himself a sanitary and heating engineer and electrical dealer and contractor, has this to say under the heading of "Wiring Times": "I have on hand a large stock of wiring material, fittings, etc., and with a practical mechanical experience of twenty-four years, wiring being a part of it for the past fifteen years, and having certificates which might be seen at my shop for the technical part of it, those entrusting me with work in my line are assured of especially good service." Now here is where he clinches the point: "Which do you prefer, an experienced mechanic or a novice?" There is just a point there which may be of interest to the average sanitary and heating engineer. Those directing the interest of the various concerns are usually men who have had experience extending perhaps over quite a number of years and have made a special study of their field. This is something which from time to time it might be well to bring before those whom you would serve. Experience is a great teacher, and the fact that you have devoted a lot of time to studying the requirements and perhaps the special needs of your own community is something which your customers might well want to know. This could be worked in every few weeks, or there might be a line carried in each ad. stating that the work will be done by one whose experience will be a guarantee of satisfactory service.

Get Your Newspaper Man Working

One might go on preaching on the wisdom of newspaper advertising but it is not with the desire to preach that this article is written. Experience proves that there is real benefit to be derived from the proper use of newspaper space. This being the case it would be well for those who have not followed up their advertising very closely to see what could be done to develop their advertising. Get in touch with the local newspaper man and see what he has to suggest. You are an experienced engineer, he should be experienced in the matter of display for your advertising. The two of you should be able to work together to advantage and with this idea in mind a successful campaign could probably be mapped out. There is nothing like starting now, because when these things are put off the delay may extend over months instead of the next day which you had expected. Prosperity is apparent all around, and there is no reason why the sanitary and heating engineers should not be sharing in it as extensively as others. One means of helping may be by using your local paper and preparing convincing copy.

HOW TO SOLDER ZINC

(Continued from page 31)

duce a very stable joint. Otherwise, the zinc is either melted or its internal structure becomes changed by the overheating, with a resultant weakening of the metal, a condition that frequently produces this complaint.

Iron Must Not Be Too Hot

"Quite important it is to know that sheet zinc melts at a temperature of 419 degrees centigrade, or 786 degrees Fahrenheit. It should also be remembered that, unlike in the soldering of tin, the best results are obtained by using a soldering iron that has not become so hot as to become dull red in color. Too often the mistake of heating the iron to a dull red before applying occurs and becomes a factor in preventing a good job. Less than 500 degrees centigrade, or 932 degrees Fahrenheit, is necessary in getting the iron to the proper heat to solder joints, when sheet zinc is utilized, by the quick application above referred to.

"Cut Acid" Solution Necessary

"It is customary to use half and half solder and with its intelligent application excellent work can be accomplished. Preceding the actual operation, however, a 'cut acid' fluxing solution, or solution of zinc chloride acidulated with muriatic acid, should be applied to the metal being prepared for the work.

Cleanliness a Requisite

"As is true of other metals, care should be observed to insure the sheet zinc being first free from dirt or grease, particularly along the line to be soldered, and customary precautions should be taken in making sure that the seam surfaces are in perfect contact. These details are essential in the successful soldering of any metal whether it happens to be zinc, or tin, or possible other materials of the non-ferrous field.

"Contrary to the prevalent idea among some metal workers, the successful soldering of zinc is one that need neither be feared nor shunned because of the supposition that the work is hard to accomplish. By observing the above details the operation is simple and necessitates the use of very little solder.

"Modern automatic soldering machinery has been installed in various plants where a large number of zinc articles are made. These have lessened to a marked degree the difficulties that were once thought to beset those who derive their livelihood from working this metal, but the hand method gives equally satisfactory results when employed by experienced workmen."

MAINTAINING QUALITY

Continued from page 13

as reasonably as they can, and then stand by their figures.

Bright and Attractive

The firm's show rooms, while not large or elaborate, have a decided advantage in being bright and attractive. Full advantage is taken of this to make an effective display. It is a part of the plan followed by the firm to change its displays from time to time, and this has been found to produce good results. The firm has a large display window, which was installed when it moved to its new quarters, and the various lines are kept well before the general public. In the centre of the display room is a desk and chair for the convenience of customers. It has been frequently found that patrons of the firm wish to sit down and look through various lists or go over plans or discuss with a salesman points regarding the goods, or about an installation, and that the simple measure of providing a chair and table was much appreciated.

Prompt Delivery

Immediately adjoining the show rooms is the office and the accountant in charge can quickly give information that is required. At the rear of the building are located the workshops and store rooms. In the store rooms a complete stock is carried, so that any work can be promptly undertaken. Another feature of the service rendered to customers is a motor car and truck. Noble and Rich have found this an indispensable feature in connection with the development of their business and a means of reducing their costs of operating as well as speeding up delivery.

Noble and Rich are close readers of SANITARY ENGINEER. They not only read it themselves, but they strongly encourage their employees to read it and keep in touch with all that is doing in the trade and the development and improvements in methods.

Market Conditions and Tendencies

STATEMENTS REGARDING SUPPLIES AND TREND OF PRICES

THE MARKETS AT A GLANCE

LOWER prices are again in evidence on galvanized sheets, amounting to about 45c per 100 pounds. An important change in respect to differentials and extras has also become operative. The revision in the differential between 10¾ oz. and 28 gauge has been increased 10c, making it now 40c. It is noted also that on 10¾ oz. and 28 gauge sheets, shipped 3 feet wide, that an extra of 20c per 100 pounds over 30 inch widths is now effective. Jobbers report splendid business being handled and anticipate present scale of prices should further increase volume of orders.

Ingot metals show some changes, tin declining 3c per pound and lead coming down ¾c per pound. There is a fair amount of business being handled and the same is true of other metals as well. The easier feeling in tin and lead are responsible for declines which have been named on solder, prices on this commodity coming down from 2c to 3c per pound.

A further change is noted in new prices adopted on boiler tubes this week. The present scale of quotations is not considered so much in the light of a market change as a readjustment from the many revisions undertaken during the past months. Jobbers indicate that the present scale of quotations has been determined upon from actual costs and it will be noted that some sizes show declines with others showing slight advances.

There have been some further revisions in the price of valves, declines being in order in new scale of discounts issued. Other lines of brass goods hold at changes recently put into effect. Steam goods are selling quite freely and trade seems satisfied with volume of business.

TORONTO, April 29.—A steadier tone to the market is noticeable this week, changes being comparatively light when viewed in the light of those made in the last issue. Some changes in prices on galvanized sheets have been made and lower quotations are noted on tin and lead. Boiler tube prices have been adjusted and the new basis is now said to be in line with costs and it is expected will remain steady for some little time.

Prices Hold On Range Boiler

RANGE BOILERS.—The market is holding at unchanged levels during the week. The demand is within rather a narrow compass at the present time but that it may improve seems to be the general feeling. Trade as a whole is better and this is being reflected to some extent in this line.

Range Boilers	Standard	Extra Heavy
30-gallon	$12 25	$14 50
35-gallon	15 00	17 00
40-gallon	18 00	20 00
52-gallon	24 00	28 00
66-gallon	33 00	38 00
82-gallon	40 00	47 00
100-gallon	50 00	58 00

Enamelware Holds In Steady Position

ENAMELWARE.—The market remains in a steady and unchanged position this week with apparently no immediate change contemplated. Some interests feel that prices should ease away somewhat and that better business conditions would result from such a move. There is little moving to the trade just now.

Bath-tubs, roll rim, 4, 4½, 5 feet, 24 to 30 in. wide	$32 10
Bath-tubs, 5½ ft.	35 70

Do., 14 x 20	4 25 ....
Closets, oak tank and seat	25 50
Do., enamel iron or white vitro tank	27 50

Soil Pipe and Fittings Holding Firm

SOIL PIPE FITTINGS.—The market on soil pipe is steady and firm at recent declines named and manufacturers report a fair demand developing. The volume of orders is not so large, there being apparently a tendency to send in orders often and for smaller quantities. Malleable and cast iron pipe fittings show no further revision from the figures named last week.

SOIL PIPE AND FITTINGS

Some Further Changes in Valves

VALVES.—There have been some further changes made in valves this week following that noted in the last issue. Standard globe, angle and check valves are being quoted at 23 per cent. discount from list; with removable disc, 22 per cent.; standard gate valves, 35 per cent., and standard radiator valves, 31 per cent. Other items on the list show no change from recent revisions. Steam goods are in active demand and jobbers and manufacturers report trade splendid.

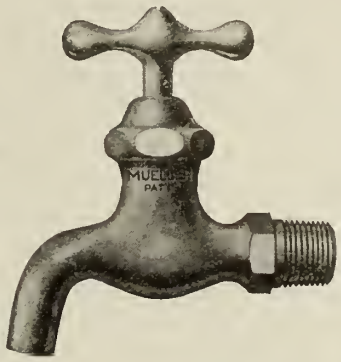
MUELLER



Compression Sink Bibbs

SIMPLE elegance, combined with superior strength and wearing quality, is what you give your customer when you install **MUELLER** goods.

The many advantageous features of **MUELLER** compression bibbs give maximum service from the bibb as a whole. The anti-spreading device that breaks up the whirling motion of the water and the corrugated stem and handle, allowing the handle to be set at any angle without becoming loose or wobbly, are only two of these features.

MUELLER Bibbs are the best the market affords. Write for prices.

H. Mueller Mfg. Co., Limited

SARNIA CANADA

MUELLER

Market Holds On Wrought Pipe

WROUGHT PIPE.—The situation as it affects wrought pipe is unchanged this week, the revisions named and reported in the last issue of SANITARY ENGINEER being steadily maintained. Manufacturers report some business offering and are in good shape to handle same. Prices appear in full herewith:

WROUGHT PIPE

Price List No. 39, April 3, 1919

Terms, 2% 30 days, approved credit.

Freight equalized on Chatham, Guelph, Hamilton, London, Montreal, Toronto, Welland.

Boiler Tubes Again Readjusted

BOILER TUBES.—Prices shown in the last issue on boiler tubes have been readjusted again, some sizes showing a slight downward move and others a slight upward move. Jobbers have worked out the present schedule carefully and anticipate present basis will now stand until the next general revision, which they indicate may be some months away. Prices to-day follow:

BOILER TUBES—	Per 100 feet Seamless	Lapweld
1¼ inch	$27 00	$.....
1½ inch	28 00	.....
1¾ inch	30 00	26 00
2 inch	30 00	26 00
2¼ inch	33 00	28 00
2½ inch	40 00	32 00
3 inch	46 00	38 00
3¼ inch	.....	45 00
3½ inch	56 00	42 00
4 inch	70 00	54 00

Cotton Waste Steady; Oakum Holding

COTTON WASTE, OAKUM.—There seems to be a better volume of business coming to hand on cotton waste and jobbers are quite satisfied that situation is improving. The market remained firm and unchanged during the week. A better feeling is apparent also in the trade on oakum though actual sales are confined to small quantities. However, they seem to be coming quite often, which is a good feature.

	Per 100 lbs.
Best American	$21 00 $22 00
Clipper, spun	..... 21 00
Do., unspun	..... 10 50
Plumbers' spun	..... 9 50

Sheets Showing Further Revisions

SHEETS, PLATES.—A slight readjustment has been made in some quarters on black sheets and basis now prevailing seems fairly well established. Whether price fixing will govern or open market rule is still the question with the trade, and some feel that the open market will win out. If it does, the opinion is held that quite a further substantial drop may be made to get down to absolutely rock-bottom figures, and get business moving along in large volume again.

Galvanized sheets have come in for further revision this week, prices showing a decline of about 45c per 100 pounds. The differential between 10¾-oz. and 28-ga. sheets has been changed to 40c instead of 30c. It is also to be noted that 10¾-oz. and 28-ga. sheets, when shipped in widths of 3 feet, take an extra of 20c over prices listed below. There is no differential charged on other gauges.

The trade which is coming to hand now is considered splendid, however. It isn't coming in big chunks, but it is coming often, and this indicates a good healthy condition in the trade. Jobbers are well satisfied with volume of sales.

BLACK SHEETS—	Per 100 lbs.
10 gauge	$5 00 $5 45
12 gauge	5 05 5 50
14 gauge	.... 5 10
16 gauge	.... 5 20
18-20 gauge	.... 5 80
26 gauge	.... 5 90
28 gauge	.... 6 00
3-16 inch plate	4 90 6 25
¼-inch boiler plate	4 50 5 80

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

GALVANIZED SHEETS—	
10¾ oz.	$7 80 $8 10
U.S. 28	7 40 7 70
U.S. 26	7 10 7 40
22 and 24	6 95 7 25
18 and 20	6 80 7 10
16	6 65 6 95
12 and 14	6 50 6 80

An extra is now charged on galvanized sheets, 10¾ oz. and 28 ga., when shipped out in sheets 3 feet wide. The extra charged over prices shown above is 20c per 100 pounds. Other gauges show no change for different widths.

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

Lower Prices Named on Solder

Prices during the week as applied to solder show revision downward, the decline generally amounting to about 2c per pound. On the present basis guaranteed solder is quoted at 33c to 38c per pound; strictly at 31c to 33c; commercial at 28c to 32c; wiping at 27½c to 29½c, and wire at 34c to 40c. Manufacturers report a distinct improvement in the sale of lead traps and bends in the last

Tap and Die Corporation

First Cost *versus* Upkeep Cost!

The purchase price means nothing if the upkeep cost is not low.

The purchase price of King Boilers is no more than the average boiler and yet—

The consumption of fuel—*the upkeep cost* is lower—considerably lower.

The thin, peculiarly shaped waterways in the "King" mean quickly heated water and perfect circulation, which causes a saving in fuel because it obviates the necessity of "extra firing" to move cold water from the radiators.

The Trade should use this quick-heating, fuel-saving argument now while fuel is scarce and high in price.

WRITE US FOR PRICES.

Mark of Proof Is Proof of Quality

There's proved and certified strength in every

WILLIAMS' IMPROVED "VULCAN" CHAIN PIPE WRENCH

Each and every Flat Link Chain is "proof-tested" to two-thirds of its listed catalog strength in a standard testing machine. To each chain so tested is attached the Gray Leaden Seal, illustrated above, and every Flat Link Chain leaving our works *MUST* bear this seal—the Proof of Quality—as evidence that it has passed our standardized "proof tests."

Look for this Mark of Proof, for it is proof of Quality—it guarantees uninterrupted, severe service as well as safety to the operator. Williams' Wrenches—"Vulcan" and "Agrippa"—are the ONLY wrenches which offer this certified assurance.

The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH

Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with wood handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

This is a "Q" Foot Valve

And it Just *CAN'T* Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

Sanitary Engineer

Plumber and Steamfitter of Canada

VOL. XIII. PUBLICATION OFFICE, TORONTO, MAY 15, 1919 No. 10.

Judge a Building

By Its Plumbing

THIS advice offered prospective tenants and house-buyers is sound advice.

If every prospective tenant or purchaser of a house made a thorough inspection of the sanitary arrangements in the house, instead of paying so much attention to the outside appearance, and usually so little attention to its appointments, sanitary engineers would be overwhelmed with work.

But they don't—

Therefore, it behooves the sanitary engineer to advise.

If the sanitary arrangements in his client's property is several years old—it is out-of-date. It needs replacing—or, to say the least, it greatly needs repair and replacement of parts.

There is going to be a lot of work of this nature done this year—and the sanitary engineer should be equipped for sudden calls. He should be fully supplied with information regarding the most up-to-date appliances. He should have us at his elbow. We can be of great service to him.

Our engineers are ready to advise him. Write us and let us place our facilities, our equipment, and complete stock of everything in sanitary supplies at your disposal. It will help you greatly.

Why this fire pot is made the way it is made

SUPPOSE every time you had a tire puncture it was necessary to buy a new wheel!

"Prohibitive" you say.

By the same token take a boiler that has the crown sheet and fire pot cast as one.

When by accident or through carelessness of operation they break—that *entire* casting must be replaced.

The Burnham is cast separately.

Crown sheet in one section.

Fire pot in another section.

When there is trouble with either one, simply replace the one that's in trouble.

Costs far less. Can be done quicker. Better in every way.

Quaturn Faucet Features

Being some good information for the Plumber

Closes With Pressure

When the water pressure is fairly heavy the natural tendency of the old-style faucet is to open and leak — with the Quaturn it shuts all the tighter. This is one of the finest features of the Quaturn and will appeal, as it already has, to all users.

Interchangeability

Working parts, such as the sleeve, cap nut, and stem of the Quaturn are standard to all fixtures. You can see the immense advantage of this. You carry only a small stock of repair parts, involving little capital outlay and with them you can repair any Quaturn fixture made. Quick service — small expense large business.

Renewable Parts

The Quaturn body, which is the big factor in cost and installation, lasts as long as the building. The wear comes on the sleeve, which may be replaced at small cost and little work at any time. Your customer will be satisfied and will be your best advertisement.

"MADE IN CANADA"

WILSON FEARED THE BRITISH

THE American President crossed the Atlantic in the first place with the idea in his mind that his ideals would be thoroughly in accord with those of the French statesmen; but he was rather afraid of a conflict with the British delegates. He found in reality that his plan for peace terms was as far removed from the French plan as the two poles. Then he crossed to London and was surprised to find that the ideas of the two Anglo-Saxon powers were identical.

This situation, according to J. W. Dafoe in the May issue of MACLEAN'S MAGAZINE, explains much that has developed at Versailles. Further, it contains the promise of a close *rapprochement* between the two great English-speaking democracies for all time to come.

Mr. Dafoe has contributed a remarkably interesting article to this number of MACLEAN'S, lifting the curtain on many of the puzzling situations that have arisen overseas. As the editor of the Manitoba *Free Press,* he is the dean of Canadian newspapermen; as the representative of the department of Public Information on the Canadian Mission to the Peace Conference, he was in a special position to learn what was transpiring. He tells of the really big part that Canada has played in the Proceedings and points out that Canada's status as a nation was firmly established in the eyes of the world when she was allowed separate representation.

A Dozen Other Features---Nationally Important

This May issue is full of articles of unusual significance for Canadian readers.

"SOLVING THE PROBLEM OF THE ARCTIC"
—By Vilhjalmur Stefansson

The second instalment of his remarkable story of the four years of exploration that he undertook for the Canadian Government in the region of the "Pole of Inaccessibility"—a harder place to reach than the North Pole.

"ORGANIZING FOR PEACE"
—By George Pearson

An article of the Great War Veterans' Association by a well-known author-soldier.

"THE CANADIANS IN SIBERIA"
—By Capt. W. E. Dunham

A graphic story of what our forces did in combatting the Bolsheviki, by an officer who has just returned.

"SAFE IN THE SADDLE"
—By J. K. Munro

A review of affairs at Ottawa in which the opinion is expressed that Union Government for the time being is safely entrenched.

The National Idea

The articles in this issue of MACLEAN'S reflect the national idea—Canada's part in the Peace Conference, the political situation at Ottawa, the exclusive report of Stefansson's national explorations, the national organization of our returned men, the work of our forces in Siberia. The reader of MACLEAN'S gets a broad idea of what Canada as a whole is doing The value of this issue— and of all issues —is very great, therefore, from an educational standpoint.
MACLEAN'S is the one magazine that should be selected for young Canadians to read.

Four capital stories by famous authors—W. A. Fraser, Lloyd Osborne, Frederic S. Isham and C. W. Stephens.

The Review of Reviews

An unusually fine array of articles is given in this department, selected from the best in magazines and periodicals the world over. Some of the titles are:

Planned to Destroy British Fleet.
How Mackensen Was Caught.
Events of War Foretold by Stars.
What is Life Like Beyond the Grave?
A High-born Bolshevik.
The New Life in Dry America.
Germans Were Ready to Capitulate.
Japan's New Foreign Policy.
The Many Kings of Jerusalem.
Is British Foreign Office Against League?
Ambassador Tells Story of Peace Ship.
Hindenburg—After the Armistice.

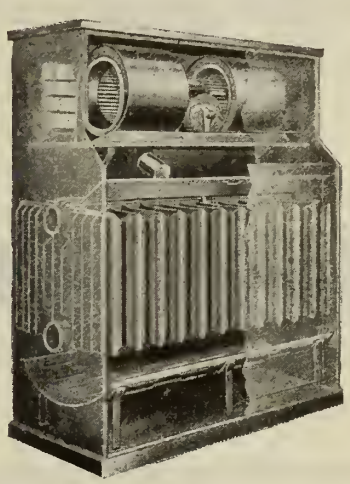
The
UNIVENT
"LIVE OUTDOORS-INDOORS"

—A Fine Booster For Your Business—



A light, easy job appeals to most men, especially if the pay is better than ordinary.

In the same sense, a light, easy installation of a Heating and Ventilating System appeals to the heating contractor—especially if there is better profit for him.

The UNIVENT installation can be made with fewer men, in less time, with less actual labor than with any other system—and the ultimate profits are greater—and your client is completely satisfied.

It is good, sound business for you to obtain a good working knowledge of the UNIVENT—the most efficient ventilating system in America to-day.

This system is successfully operating right now in hundreds of buildings of all kinds.

Some valuable territory still open for good sales representatives.

PIPE THREADING TOOLS

Take Another Look At This Job

ESTABLISH PEACE

If you desire to establish lasting peace in your shop, you will have to furnish your men with good tools. Men will not do the same amount of work if that work is hard. The more you *INVEST* in tools if they're good tools, the less you will SPEND in labor. To invest is to establish an asset, to spend is to create a liability. Our tools will save you money and make peace in your shop.

ESTABLISH PROFIT

Work made easy becomes a pleasure. Jardine and Toledo Pipe Threading Tools make threading pipe so easy that a boy can thread a 4-inch pipe as easily as he can thread a ½-inch pipe.

Not only so but when a thread is made with one of our tools it's a good thread. No cutting off pieces of pipe. No lost time and no leaks. That's the way to establish a profit on every job.

A. B. JARDINE & COMPANY, LIMITED, HESPELER, ONT.

FOR BUSINESS PROSPECTS

"BIGGER AND BETTER BUSINESS." Fine words, easy to say, but they don't mean anything unless there is some force behind them, and yet "BIGGER AND BETTER BUSINESS" means much to every person in the trade.

Bigger business means increased production for the manufacturers, lower prices for the product, more contracts for the contractor and more employment for the workmen. Bigger business will come to us with the revival of building operations, but why wait—now is the time to go after business.

In the last four years, due to scarcity of material and workmen, a great deal of work that should have been done was neglected. Make a survey of your own territory or the neighborhood in which you are doing business, and you will doubtless find that ten, perhaps twenty per cent. of the buildings and homes require new plumbing or replacements of the present sanitary fixtures.

Now is the time to go after that business. It is good business and can be installed more economically now than at any other time. The prices on plumbing work are not high, as a matter of fact the cost of plumbing in the aggregate has not advanced in the same ratio as other lines of business. Figure it out for yourself, tell it to your customer, give the statements the greatest publicity and follow it up with helpful hints which will attract your customer's attention, but whatever is done should be thorough and the illustrations should illustrate and describe a complete job, and nothing will attract more attention than an illustration of a modern bath-room, its tiled floors and tiled dado, canvased and painted ceiling and walls and "PORT HOPE" enameled iron sanitary fixtures, and finish your bath-room with the necessary accessories, such as soap dishes, tumbler holders, plate glass shelf on brackets and wall cabinet.

Be prepared to say what the job, the whole job will cost. It will interest your customers and perhaps surprise you to know that such a bath-room will not cost much more than some of the luxuries upon which people are spending money freely to-day; certainly the money will be better spent, as every dollar spent on the bath-room adds comfort to the home and adds double its cost to the value of the house.

Yours for a Bigger and Better Business.

Develop Business Side of Plumbing

"Only Way to Make Money Out of the Trade," Says New President of the Ontario Association. Tells of Methods by Which He Has Built Up a Steadily Growing Business

Based on an interview by C. E. PARSONS, of SANITARY ENGINEER, with Thos. J. Minnes, Brantford, Ont., President O. S. D. S. & H. E.

"THE plumbers of Canada must forget that they are plumbers, mere fixers of pumps, cleaners of sewers or repairers of ball cocks. They must develop the business side of the trade. They must develop salesmanship. They have got to learn that the public does not appreciate the mere fixer. The trouble has been that we have been educated as plumbers and not as salesmen or business men. We have got to work along new lines and we have have got to learn the value of co-operation."

This is the view of Thomas J. Minnes, of Brantford, Ont., who was recently elected president of the Ontario Society of Domestic Sanitary and Heating Engineers. He is working along these lines, not only in his own store, but in the Brantford branch of the Association, and plans to get the same spirit into the trade throughout the province.

"Handling electrical goods showed me where I was working along the wrong lines," said Mr. Minnes to SANITARY ENGINEER. "I had not been in that end of the business very long before I learned that I had got to be a salesman. We were driven into the electrical business. People who wanted plumbing done frequently asked about this or that electrical work. For instance a man for whom I would be putting in a bath room or making some repairs, would say, "I would like a light here and one there. I guess you can do that just as well as anybody else, and I will not need to get an electrician." There were so many of these calls that we had to get an electrician to do the work. At first we tried it on a ten per cent. gross basis.

Interior view display rooms of T. J. Minnes, Brantford, Ont.

But one of the troubles was to get a good man, and one whose work could be depended on. We finally got our own electrician. It was not long before we discovered that if we were going to be in the electrical business and make money out of it we must not depend upon wiring alone. We just naturally drifted into the business of handing electrical supplies and fixtures. That was three years ago. Now we have three electricians and the business is growing steadily.

Has a Fine Display

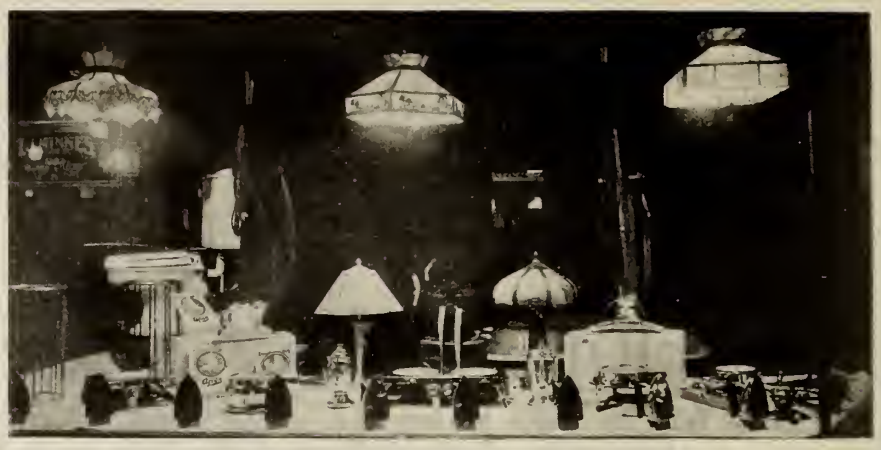
Mr. Minnes soon discovered, he says, that the best way to sell electrical fixtures was to let the people know he had the stock. He arranged an attractive window display. He rearranged his store, and one section of it now contains an attractive showing of lighting fixtures, all connected and arranged so that customers who come down to make a selection can see almost exactly how the fixtures will look when placed in their own homes. Mr. Minnes does not have just one or a half dozen fixtures. He has a wide variety for people to choose from. In other words he carries a stock and this, he says, is one of the foundations of successful selling. People, he says, like to look over a lot of goods and compare one with another. He finds that it pays to carry the stock.

The business has grown steadily, and Mr. Minnes now sells a steadily increasing number of electric washers, vacuum sweepers, electric lamps, electric irons, electric toasters and other lines each season.

Advertising Pays

"It certainly pays to advertise," said Mr. Minnes. "The more complete a stock is the easier it is to sell, always provided you let the people know you have it. The daily press is one of our best means of reaching the people. We use a fair sized space, and we have found by comparing results that it pays to have the ad. inserted in the same place each time. Our location is in the local news section every night. People cannot help seeing it there. We change the copy very frequently, sometimes every day, and always try to have a real newsy advertising message to give the people. We have found that street car advertising produces results also. It reaches a certain section of people. It would not, though, reach, for instance, the man who rides in an auto. It would not reach many others that the daily newspaper reaches. We use the side of our building for advertising purposes, and we use our writing paper and our window. We have adopted a trade mark that we want to become known everywhere in our territory. It is "The men who know." We use this at the bottom of our ads., in our window, on our letter heads and on our stickers. On every parcel we send out a sticker is attached, bearing the firm name. All these things help to impress our store and our service in the minds of our customers."

Mr. Minnes declared that his experience is that theatre programs are of little use for advertising the lines he carries. This class of ad. catches people at the wrong time, when their minds are busy with something else, and they are not thinking of buying, he says.



Window Display Electric Fixtures Made By Thomas J. Minnes, Brantford, Ont.

"In all our advertising," he stated, "we try to say what we have to say as simply and in the fewest words possible. We always try to give whatever details we think the people would ask if they were in the store talking to us, that is the essentials. There are a few things that everyone wants to know. The price, what a thing will do and what it looks like. We usually use illustrations, and nearly always give the price. All sales talk is reserved until the people come to our store. Then we go after them and explain fully all the points of superiority in whatever line we are showing. I would say that it certainly pays to handle advertised goods.

Tell One Another

"Satisfied customers, especially women, are one of the best selling forces we have. Take electric washers for instance. A woman gets one and is satisfied with the work it does. She tells every one of her friends, and more than that, very often shows them how it works and how it saves time. We can get no better ad than that, and we have sold a number of machines simply because our friends practically made the sales for us.

Mr. Minnes here reverted to advertising to recall an experience he had. He stated that the firm had been handing a line of high priced gas ranges prior to the war. Not long after the war started prices got so high that he decided to quit handling them.

"I got cold feet," he said. "We had been advertising the stoves and selling them, but when the prices reached the point they did I said there was no use trying to sell any more, and we quit advertising them and stocking them. For months after people kept coming into our store and asking about these stoves, saying they had seen our ads and knew we handled them. I learned right there the effects of advertising. You must not expect results too soon for one thing. This year's advertising will help your next year's business. Sometimes it takes quite a while to get the best results from advertising a line, but if you keep at it you will get them."

Mr. Minnes is a former president of the Brantford branch of the Ontario Society of Domestic Sanitary and Heating Engineers. He is one of its best workers and one of the most thorough boosters for organization and co-operation.

"It has produced results," he said. "Nothing that I know of could have accomplished the results among our boys in Brantford that we have obtained through our club. The trouble that is one of the worst troubles in the trade in many places was right here in Brantford, that is, price cutting. The boys were suspicious of one another and there was no organization. We got together and we have been working along definite lines, and we are getting results. We have talks on salesmanship and trade problems and we pull together now. We understand the other fellow's viewpoint and we have learned that he is not such a bad chap after all, and that very often unless we really knew the circumstances we were misjudging one another. One of our latest plans is to try the 'open price' system. We will see how it works, and I am satisfied personally that it will work and that it is the right method to work along."

Making Salesman

"We are making our salesmen and the results are surprising. It is far better in a great many cases where we are called to make repairs to put in a new part. If this is done the customer starts again with something that should give service. If repairs are made it is usually only a question of a short time before the thing needs repairing again. All our men are now instructed to sell new parts or new goods wherever possible. This plan makes for better satisfied customers, and it is better for us. There is any amount of new business that can be created by suggestion and we are working now to get all of it we can. I know conditions in Ontario fairly well, and I think I am safe in saying that Brantford plumbers are second to none as salesmen in the whole province. Here is one example of what can be done. One of our men went to an institution after being called to make a minor repair. He found that not enough hot water was being supplied to get the proper results from an electric washer that had been installed. He made cer-

tain suggestions and showed those in charge where time and money could be saved by making certain installations, and by adding certain wiring. As a result we got $854 worth of work from what at the start was only a job of a couple of dollars. The people were tickled to death too, after the work was finished, because everything worked so much better. There is a big field for every plumber along this line. I am satisfied that salesmanship should be practised by each man, and that in the great majority of cases it is bad business to make repairs.

Don't be a Knocker

"In selling either in the store or out on the job," says Mr. Minnes, "never be a knocker. Don't belittle the other fellow or any other line of goods that you are not handling. If you can't say anything good about them don't say anything and you will be better off in the end. We always try when selling to urge people to take the best quality of goods, and we find that it pays. People appreciate service, not only in the store, but in what they buy. Many people depend to a large extent upon the recommendations made by the men in the trade in buying, and it is easy to sell them a really good article and get more for it and more profit than some cheaper line that will not give them the results they want. In selling electric washers we keep track of every one that goes out of the store, and if we are in the vicinity of the house drop in and ask to see it. We frequently find that it needs oiling or adjusting although the owner will declare there is nothing wrong, and that it is running beautifully. Our customers thoroughly appreciate this sort of service, and, as I said before, they boost sales for us. When people come in to buy a washer we never try to sell them right there and then. We refer them to Mrs. So-and-so or Mrs. So-and-so, whom we know that they know. We ask them to go to the house and see the machine work and hear what the woman says about it. When they come back the sale is easily made, and they, in turn, become boosters for us.

Means Big Loss

Speaking of the results that have followed the formation of an association in Brantford, Mr. Minnes referred to a manufacturer from out of town, who did not deal fairly with the plumbers, in that he sold directly to a certain firm a fairly large order of goods required for some work the firm had in hand. The plumbers found out about it, and the members of the association have not handled a dollar's worth of the firm's goods since.

"They may have made a few dollars on the sale," said Mr. Minnes, "but they have lost a good many thousands in not having their goods handled through the nine members of our association. By standing together and working together in this way we can get results where no individual could do anything."

At the Parting of the Ways

Ontario Secretary Gives His Views—Chance Now to Get Together—Need of Federal Plumbing Code—Apprenticeship Question a Live One at Present—Views of Members

Written for SANITARY ENGINEER by C. E. PARSONS.

THE plumbing and heating business in Canada is at the parting of the ways. In the opinion of Secretary Garrett Frankland, of the Ontario Society of Domestic Sanitary and Heating Engineers, 1919 will be a fateful year for all those in the trade.

"We have the chance now to get together and do something," he said to SANITARY ENGINEER. "There is only one way to get results and that is through co-operation. Perhaps no business in the Dominion has more problems to solve than the plumbing and heating business. No one man in the trade can solve these, but if every man from coast to coast will do his share we can win out and put the whole trade on the plane it should be on.

Go to the Meeting

Every man should make it a point to go to the meeting of the Dominion Society in Montreal on June 3 and 4. There will be a lot of matters of vital importance to the trade to be discussed. If there is a good turn-out of members and the interest taken in matters that should be taken, we are going to be a big factor in the affairs of the Dominion. One of the troubles in the past has been that the plumbers have been an easy-going lot of chaps, not alive to their own interests or the interests of the trade. The time has come when if they get together and work together we can accomplish results worth while. This is the first Dominion annual meeting since 1916, and it should be a record-breaker. I am satisfied that Toronto is going to send at least fifty delegates, and there will be delegates from Brantford, Guelph, London, Windsor, Hamilton and other parts of Ontario."

Two-day Session

The sessions will be held in the Caledonian Club Rooms at 101 Burnside Place, Montreal. The executive meeting will commence at nine o'clock on the morning of June 3, and the general meeting opens at two o'clock on the same afternoon. Sessions will be held the rest of the day and all day on June 4.

"The spirit of to-day is organization and co-operation," said Secretary Frankland. "We learned from the war that that is the only way to win. It is gratifying to see the way in which many members of the plumbing trade are coming out of their shell, getting together and working for to make things better. That is the only way to work."

In the opinion of Mr. Frankland one of the most important things that should be brought up at the Montreal meeting is the formulation of a Federal plumbing code.

"This matter should be urged upon the Dominion Government in the interests of the national health," he said. "The Government at Ottawa should take the lead in this work and set the example for the rest of the provinces to follow. There is nothing of more importance in the development of a nation than the health of the individual people. As far as the Government is concerned, this matter has, to a large extent, been neglected, especially from a plumbing and sanitation standpoint. There is a great amount of research work to be done and the sooner it is started the sooner results will be accomplished. The Federal authorities should take the lead in framing a code that will serve as a standard for the provinces."

Some Other Views

President Thomas J. Minnes, of Brantford, Ont., who was recently elected as head of the Ontario society, is busy arranging matters he plans to bring up for consideration. He is getting in touch with a number of members in various parts of the province and finding out from them what they think should be taken up.

"One of the most important things we can do," he stated to SANITARY ENGINEER, "is to show members all over the country that they must be business men.

Every man in the trade will benefit as soon as the plumbers of Canada realize and practise this. Perhaps no members of the trade in Canada have more thoroughly learned the importance of organization and co-operation than the plumbers of Brantford. They have gained the confidence of one another. They are prepared to help one another. I am safe in saying that there is no man in our organization who has not learned many things of value since we got together. The same thing applies all over the country.

Apprenticeship Question

The apprenticeship problem is one which has been causing a lot of trouble in many parts of the country, and Mr. Minnes plans to bring the matter up and endeavor to arrive at a solution. Education along technical lines, he believes, is one of the essentials to be considered in connection with whatever course is adopted.

Something should be done, he believes, to bring plumbing inspectors all over the country under the direction of the Boards of Health.

"As it is now," he said, "many of the inspectors work under the city engineer, the building inspector or perhaps no one in particular. Public health is too important a matter to take any chances with, and the man who should know more about public health than anyone else is the Medical Officer of Health. He is usually one of the most important members of the Board of Health. Plumbing and sanitation and health are more closely related than any other civic matters, and there are none that need more careful consideration. By working together the Medical Officer of Health, the Board of Health and the Plumbing Inspector can, I believe, accomplish maximum results. Under the plan followed at present in many places plumbing matters are really a detriment to health. In my opinion the city engineer is not the man who is most competent to judge about health matters. That should be the job of the M.O.H.

Too Much Neglected

Not enough attention is being given to this matter in general. What interests public health is public business and should be given the most careful consideration. I think there is no question of doubt that if many houses the country over were given the inspection they should be given they would be condemned. This would result in a lot of work being done that would improve conditions and the health of the people as a whole.

Mr. Minnes believes, also, that something should be done to direct the attention of the Government to the standardization of the plumbing by-laws. This is one of the matters he believes the newly-organized Federal Health Department might look into with good results to the public at large. There is a big field for operations in this work all over the country, he says.

Wants Resale Price

John Cunningham, of Cunningham & Co., Paris, Ont., thinks that one of the most important matters to be taken up at Montreal should be getting the wholesalers to adopt a system to keep prices the same. He instanced specially the case of pipe, stating that many firms, not plumbers, can go and buy pipe just as cheaply as the plumber can. Not only pipe, he says, is sold this way, but other goods.

"They should keep prices the same," he said. "It makes a fool out of the plumber when he quotes a price after being asked and is told that the party wanting pipe or some other goods can buy it for so much. It is not fair to the plumber and the wholesaler should protect the trade. This sort of thing puts you in bad with customers, especially if you have done any work for them before. They get the idea you have been robbing them. As far as the wholesaler is concerned he takes no chance when it comes to collection. He gets his money from the plumber. But the plumber has to take a good many chances when he sells to the public.

Might Use Movies

Mr. Cunningham says something has to be done about the apprenticeship question and done soon unless the trade is to suffer.

"Some action must be taken to stimulate interest in the plumbing trade," he said. "Perhaps if movies were used to present to the young men and boys who are growing up some of the technical feats in the work it might help. Boys and young men are very often influenced by seeing workmen performing interesting or difficult operations and want to learn how to do it. An important matter in connection with apprentices is that of technical education also. It seems to me good results might follow if a provincial instructor of apprentices was appointed by the Government to visit each city or town regularly and instruct the boys. Lack of apprentices and proper training will certainly have the effect of lowering the standards of the trade unless it is checked."

Would Have a Chance

John Eggett, of Eggett & Co., London, Ont., said that he would like to see something done in connection with the present method of awarding Government contracts. He is opposed to the plan by which bulk tenders are awarded to one man, who sublets the plumbing, heating and other contracts.

"Each trade should be given a chance to figure on its own work," he said. "Many of the larger jobs are too big for a plumber to put up the necessary deposit for a bulk contract. Many firms, however, could do this on the plumbing and heating work. I think it would work out better for everybody. As matters stand now the general contractor gets a profit out of the work. If each man were given a chance to tender on the work he would be assured of getting the business if his figures were the best, and the Government would be able to get better figures."

Secretary E. H. Russell, of the Master Plumbers' Association, of London, expects to attend the Montreal convention and stated to SANITARY ENGINEER that if he does he will endeavor to have the plumbers, the manufacturers and the insurance companies combine their forces and work together in solving matters that are of mutual interest to all.

"There are many questions," he said, "in which the plumbers, the manufacturers and the insurance men are interested. There is no quicker way of getting results than by co-operation and with three forces centred upon solving any problems that come up I believe we could get excellent results."

Secretary Russell also spoke about the need of a change in the method of awarding Government contracts and favored giving every firm a fair chance to tender. "I think," he said, "it is in the interests of the people at large that each trade should be given a chance to tender on its own work instead of it being farmed out through the general contractor. It is too serious a thing to tinker with. By giving each firm a chance to figure, better results would be obtained and it would make for efficiency all round. As it is now many plumbers have to waste a lot of time and energy for nothing as the general contractor goes around and gets all the figures he can and often takes the lowest."

He thought, also, that something should be done to speed up the signing of the new Ontario Act. "It ought to either be accepted or rejected," he said. "All it needs is the signature of the Lieutenant-Governor. If it is put through this act might serve as a model for the other provinces."

Alberta Plumbers Make Forward Plans

Good Outlook Expressed by Provincial Vice-President Marr—Provincial Health Law to be Revised—Profits are Discussed—Interest is Wide—Interested in the East

Written for SANITARY ENGINEER by A. H. ILLSEY.

THERE is an evident interest in the sunny province of Alberta in matters that affect the plumbing trade. SANITARY ENGINEER is in receipt of a letter from provincial vice-president James Marr, in which he echoes the splendid spirit of members of the craft, and which clearly denotes the forward look that is held there by himself and his brother plumbers. This is the spirit that begets progress, and excerpts from the fine letter of Mr. Marr will indicate that there is no sleeping in Alberta, and that a better day is dawning for the trade generally.

Held Early Meeting

Calgary's Horse Show Week in March, was the time chosen for holding the Alberta provincial convention this year. In response to the call sent out, a large number gathered from north and south, east and west, enabling the officers to feel that their efforts to get the boys together was not in vain. "A goodly response," writes Mr. Marr, "was made to the call, from all parts, and you can see by the picture which accompanies this letter that a good and healthy bunch got together on some of the most vital questions pertaining to the trade. Organization was taken up, and well sustained. It was quite evident, by the interest that the men took in discussing the question, that they were all alive to the great subject that is agitating the minds of the people at this time, namely, the getting settled of our boys, as they return from the war, to good business."

How to Make Money

"A campaign of education," continues Mr. Marr, "on how to do business at a profit, that goodwill and prosperity may attend the efforts of all those who would do justly by his neighbor, was discussed."

Surely the convention struck a most important note here. The plumber, as the Dominion president of the Canadian Society told the writer a few days ago, is one of the best tradesmen in Canada. He must be alive to his opportunity. If he will interest himself in the problems that must receive attention, he will greatly profit. And he cannot do better, surely, than to follow good common sense by studying his costs, and making quotations on his work that are in keeping with these costs, allowing himself a sane, living margin of profit. All power to a movement that has this as its ultimate goal. No tradesman can progress on an uncertain basis, and SANITARY ENGINEER wishes this part of the Alberta boys' program the greatest success.

One of the biggest questions receiving attention at this convention was that of a revision of the provincial health by-laws. Mr. Marr states: "The provincial health laws, as applied to plumbing, was the next question taken up. This also came in for a good, healthy discussion; a committee was appointed to go over the laws, and make such additions and amendments as they thought desirable, and bring in a report. Later this report was submitted to the whole convention, and, with minor alterations, approved. A deputation was appointed to wait on the Minister of Health at Edmonton. I may say that this deputation was well received by the Hon. Mr. McKay, who listened to the various members attentively, and who took a lively interest in their remarks. Another meeting will be held later, when a fuller discussion of the various changes in the health laws, as they pertain to the plumbing trade, throughout the province, will take place. The Provincial Board of Health will then meet the deputation."

Sends Good Wishes

Mr. Marr leaves no doubt as to the attitude of the Western plumbers. He indicates clearly that they are alive to the advantages ahead, and that they mean to place the plumbing fraternity upon a high plane.

"It is a long way to Montreal from Alberta," he continues, "and you will have

Budget—Budget—What's in the Budget?

Speculation Rife as to What Finance Minister Will Set Forth—Opposition Leader's Views Cause a Sensation—Low Tariff Element Seems to Have Subsided

OTTAWA, May 15.—Sir Thomas White recently announced that the budget would be brought down in the near future, and speculation as to what it will contain naturally grows keener; but expectations, as far as the low tariff wing in Ottawa is concerned, are not great. In fact, some of the most radical of the Western low tariff men are understood to be becoming reconciled to the fact that they will have very little to take back to their constituents in response to those telegrams which, during the session, have poured in on them thick as the leaves on Vallombrosa. Even Mr. Maharg who, during the early part of the session, in an interview with a MacLean representative declared that the War Tax of 7½ per cent. had to come off first shot out of the box, before attacking the main tariff, has now come around to the view that a reduction of the War Tax on necessaries will be about right; and he, like many other Western tariff reformers, will accept a considerable reduction from his early "ultimatum."

The Opposition Leader Speaks

When the Leader of the Opposition announced in the most casual way in the House on Friday, that he was a protectionist, he further added to the extraordinary mix-up which Parliament presents this session. Mr. McKenzie's exact utterance, which promises to become more or less historic in the annals of the Liberal party, was as follows: "While I am not a very high protectionist, I am not in favor of the tremendous wall which my friend from Peterboro (Mr. Burnham) would like to build; but I cannot help knowing that protection of certain industries has done much for this country. I cannot help knowing that in connection with this very plate industry we are talking about and the institution of the steel works at Sydney, those steel works have furnished a market for our Nova Scotia coal and employment for thousands of colliers who to-day would not be employed were it not for the assistance which the Government in the early stages gave to the development of our steel and iron industry."

Caused a Sensation

It is not too much to say that this utterance caused a sensation. It was a formal announcement of the well recognized fact that, so far as the tariff goes, there is little or no difference between the two parties. The only free traders now in captivity are the few doctrinaires who air themselves once a year at the Grain Growers' convention, where even their leaders no longer agree with them.. Mr. McKenzie's own following is divided, however, and apparently had no idea that he was about to make the pronouncement he did. One of them afterwards expressed the view that he thought his leader had temporarily lost his head; and that he certainly did not represent his—the speaker's—views. Officially, the Liberal party is still anti-protectionist, and old Liberals have to talk like this; but, actually, there is not much doubt that the two parties are to-day not very far apart on the tariff. Strong evidence of this is found in the fact that a paper like the Halifax *Morning Chronicle*, which has been known as the Liberal Bible in Nova Scotia, is now openly in favor of a reasonable protective tariff. The action of the Leader of the Opposition was, no doubt, considerably influenced by the fact that his constituency is located in the centre of the steel industry in Nova Scotia; but his personal hold on the constituency is so strong that he does not require to sacrifice his ideals, and he was no doubt speaking from considered convictions. It may indicate the line which the majority of Liberals will take at the convention called for next August; but, if so, there is likely to be a lively convention.

Poor Political Tactics

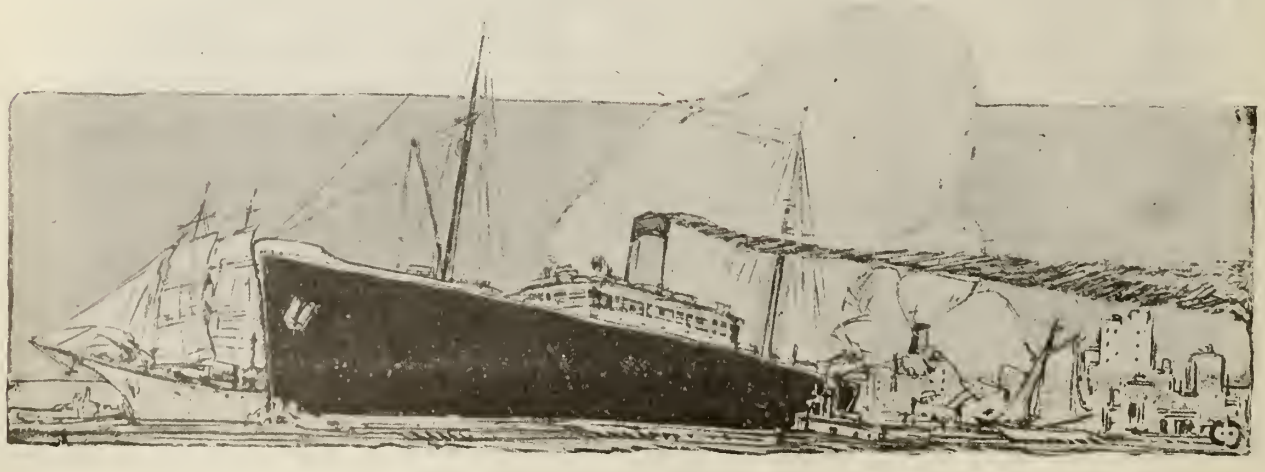
But, however it is looked at, it was a very poor exhibition of political tactics. It made the amendment proposed by Mr. McMaster some time ago look more foolish than ever, and it was considered foolish enough when proposed. It materially strengthened the tactical position of the Government, which has been considerably embarrassed by the attacks of the Western members. It placed those members themselves, and also the member for Red Deer, Michael Clark, definitely in the class of political orphans. Dr. Clark has already moved away from the Government side, and over to the cross-benches; and it would not be surprising to see members like Mr. Maharg, of Moose Jaw, Mr. Read of Yorkton and Mr. Andrew Knox of Prince Albert soon follow him.

Low Tariff Men in Difficult Position

The position of the Western low tariff men like those mentioned has become very difficult. They seem to feel that their case for tariff reduction is practically lost, so far as the present session is concerned. They expect very little consideration from the Government, and have now little reason to cast in their strength with the Opposition.

What of the West?

From the experiences of the Western low tariff men in this Parliament, it would not be surprising if the future should bring about new political alignments in the West. The Western members are having the conviction forced on



them that the low tariff sentiment is considerably less powerful in Canada than it seems at an enthusiastic convention of the Grain Growers in Saskatchewan. Apart from that Province itself, there is no part of Canada where protection is really in bad odor. Eastern people are sometimes inclined to think that the West as a whole is low tariff, but this is far from being the case. In British Columbia, sentiment is in favor of a protective tariff, with the lumbermen and the fruit-growers both favoring it. Alberta and Manitoba are far from being solidly anti-protection. Saskatchewan alone can be called a stronghold of the low tariff party. The Western members who were so vociferous in the early part of the session are beginning to realize that the East is a pretty big factor, and that there is mighty little purely free trade sentiment left in it.

In Alberta, I notice that the Grain Growers and Nonpartisan League is having a sort of rapprochement. Sometime ago the possibility of a union of forces on the part of certain Western electoral powers, such as the labor and agrarian parties, was suggested. If the West is to effect much in Parliament, some such union of forces will probably be necessary.

The time seems rather a crucial one for the West, nevertheless. There has been so much protest and threatening from that quarter all this session, that the House is rather interested to see just how much bluff there was in it. The high tariff men, who have been urging the Government to stand pat, have always minimized the sincerity and the seriousness of this Western agitation, claiming that it was largely froth, and would not be crystallized into action. If no substantial reductions are now made in the tariff and th West stands for it patiently, it is certain that the high tariff sentiment, both in the country and in the Government, will be greatly strengthened and heartened.

The Western men are, therefore, between the devil and the deep sea. The Opposition (which is nothing if not independent, so far as attempting to attack supporters is concerned) does not appear to care whether it adds to its members in the House or not. About the only thing the Western low tariff men can do to express their disapproval is to form a wing of their own in the House; and there is not a sufficient number of them to make much of a hit.

The longer this question is before the House, the fewer become the out-and-out low tariff men, even from the West. Mixing daily with members in the House who are either moderate or high protectionists, their attitude inevitably becomes affected to a certain extent by the company they keep. They feel somewhat like the obdurate juror, who holds out against the other eleven. Few men have the courage to maintain an extreme position to its extreme limit among men with whom they mix intimately every day for months.

Hence we see Mr. Maharg, the protagonist of low tariff, much more vociferous when in the West than he now is in Parliament. Perhaps this is due to some extent to the fact that while here he is not immediately under the eye of Mr. Musselman, secretary and moving spirit of the Saskatchewan Grain Growers, who has always influenced his opinions a good deal. Mr. Maharg is said to be a Tory at heart, and has a stout Tory brother at Brandon. At all events, if he does not receive more comfort from the budget than is now anticipated, and takes it without some emphatic action, the protectionists of the East will take fresh courage and the Grain Growers of the West are likely to get a new leader.—T.M.F.

THE SOLICITATION OF BUSINESS

A storekeeper is a man who keeps a store; while a merchant is a man who sells goods. A storekeeper waits for customers to come to him; a merchant takes his wares to prospective buyers, and by the arts of salesmanship induces them to purchase what he offers. The solicitation of prospective buyers may or may not appear to be hard work—it depends on the man. Some men are born salesmen; they delight to sell, to have a prospect in front of them whose mind and will must be brought into accord with the mind and will of the salesman. But one can acquire the ability to sell, just as one can learn anything—how to jump, or use a typewriter, or play golf, or fly an aeroplane, or control his temper. For a plumbing dealer to say, "I cannot bring myself to solicit business," is to tell a lie. What he means, if and when he says such a thing, is that he finds it distasteful or troublesome to solicit business. If we let our feelings guide us and regulate our practices, many of us would change our wives, would kill our enemies, would win the war and quit working.

If it be granted that a plumbing storekeeper should change into a plumbing merchant—that is, should become a solicitor of business—then one form of commendable solicitation is newspaper advertising.

Current Events in Photograph

MAY BE FIRST TO FLY ATLANTIC

Harry Hawker and Commander Grieve, after numerous tests, declare themselves perfe c t l y satisfied with the behaviour of this machine. In it they hope to be the first to cross the Atlantic and win the prize of $50,000 offered by the London Daily Mail. The machine has exceptionally powerful engines.

Quebec Province Swings Into Line

Will be Represented at Montreal Convention Next Month—Better Days Ahead for Plumbing and Heating Trade in This Province—Here is Real Encouragement

THERE is little doubt but that the Master Plumbers of Canada are alive to the good things that are coming. They realize that these cannot be got without going after them, and this will mean bigger and better organization throughout the country.

Quebec Province is already in line, and there is a great deal of interest in Quebec City at the present time. There, the latest effort has been directed toward interesting the members of the craft in the plumbers' section of the Builders' Exchange, and real progress is being made. The following form a committee of ten, and the names are those of some of the leading master plumbers of the rock city: C. Huot, of A. Huot, Reg'd; L. Letarte, of P. P. Giguere & Co.; E. Matte, of Vaudry & Matte; M. Gaudry, of O. Picard & Sons; F. Gingras, H. Jobin, E. G. Brousseau, of Brousseau & Frere; John Walker, P. Noel, P. Paradis. With a personnel such as this there should be real action from the pumbers' section, and progress will doubtless be very decided during the present season.

Mr. J. Clifford Huot was elected president of the plumbers' section, and is already planning aggressive work, it is understood, for his committee. With cooperation from them there ought to be great things ahead.

In a letter received from Mr. E. G. Brousseau, president of the Quebec Builders' Exchange, SANITARY ENGINEER is informed that full organization of the plumbers has been effected. This was done on April 15, and with the above result. Mr. Brousseau says, in part:

"The master plumbers of this city are as well organized, if not better, than any city in the Dominion. I was elected president of the Quebec Builders' Exchange on January 17 last, and at that time only six master plumbers were members of the association, and the plumbers were the only trade that had no committee to report to the association.

"During the month of April, in provision of difficulties with the journeymen, and which may happen here as well as in other cities, I took advantage of this and called a special meeting of the Builders' Exchange, and we succeeded in forming a committee of a few master plumbers."

A meeting was subsequently called of all the plumbers of the city, and they were urged to come, in their own interest, and to their own advantage.

"There were seventeen at this meeting," continues Mr. Brousseau, "outside of our membership, and twelve of them immediately signed their application and paid. I called a second meeting a week after, and had the same success, twelve more joining. We have now thirty master plumbers in our association out of thirty-six or thirty-seven in the city of Quebec ——."

E. G. BROUSSEAU
Master plumber, Quebec, President Quebec Builders' Exchange.

"Our committee met yesterday, and a nice programme was studied, the principal articles being by-laws, improvements in our general relation to contractors and architects, particularly as regards balance left in guarantee on contract, which we find too high when it is remembered that, besides a check of 15 per cent. of the whole amount of contract, they retain 15 per cent. more on each of our estimates."

Other important items were considered such as the terms and treatment that should be expected from the supply houses. It was endeavored to take steps that would prevent the necessity of the plumbers fighting one another after general contracts are awarded.

Mr. Brousseau is making plans to attend the June convention, and it is to be hoped that the Sister City will send a very large representation. All will be welcomed by their English and French brothers in the trade, and it is not necessary to be appointed a delegate to entitle one to attend. All plumbers are eligible and will be warmly welcomed.

ONE LEADER'S VIEWS WERE SUMMED UP BRIEFLY

"A receptive attitude toward such ideas and suggestions, I find, keeps me alert and sensitive to ever-changing conditions, and minimizes the danger of getting into a rut and fossilizing.

"There is such danger, and we as dealers are wise if we avoid it by every means at our disposal."

What of Comparative Prices in Retail Advertising?

Has the use of "comparative prices" in retail advertising been abused to such a degree that an advertisement is weakened when the claim is made that the article is worth so-and-so, but is being sold for so-and-so (a low price)?

Some of the leading retail stores have concluded that such statements have so often been untrue that they are losing their power to produce trade because of this feeling and the knowledge that the "comparative price" is a constant temptation to department managers and others to exaggerate, they have eliminated such statements entirely.

They believe—and their sales records bear out the assertion, says a bulletin from the Associated Advertising Clubs —that a well-written description of the goods, followed by the announcement that prices are uncommonly attractive, is a stronger appeal than the other style of store advertising. Prices are, of course, usually stated, though not on all occasions.

The Associated Advertising Clubs are seeking further information on the subject, and to this end, William P. Green, organization secretary of the National Vigilance Committee of the Advertising Clubs, recently issued a letter to a number of representative stores in many of the more important communities of the country, which reads in part as follows:

"We are interested in having your viewpoint on such questions as use of the term "value," the conditions, if any, under which goods in lots may be advertised "values up to," and such other phrases as your experience has shown you to enter into a determination of right policies.

"We would like to have you tell us whether some stores, by reason of size, class of goods handled, or business conditions, are justified in using comparative prices, and if so, to what extent.

"Also please let us have your reaction on this—if a store announces that it does not use comparative prices in its advertising, but subsequently advertises goods "one half off," without stating either the original or sale price, is this, in your opinion, really comparative price advertising? Kindly explain your answer."

What They're Doing in Hamilton

Getting Away From Price-Cutting Evil—Blackboard Talks at Association Meetings—Social Side of Co-operation Encouraged

PRICE cutting has been and is one of the curses of the plumbing trade all over Canada to-day. Perhaps one of the worst places of all was at Hamilton, Ont. Note the WAS, because in the past few months Hamilton firms have been getting together and discussing the situation and finding out that if they want to make any money they have got to eliminate price-cutting. They have been getting together because they have an association, and the association has grown steadily because the sessions are made of real practical value to the members. A year ago the association had six members, to-day it has twenty-five, and one by one the firms not represented are coming into the fold.

Lots of Work

It has meant work, lots of work to put the Hamilton Association in the position in which it stands to-day, but the president, James H. Cunningham, likes the work and determined to see it through.

"One of the hardest things in connection with the association work," he stated to SANITARY ENGINEER, "has been to get the boys to realize that they have a common interest. They did not see the value of co-operation. They did not understand that in order to get results they had to work together. They were frequently openly suspicious of one another, and when a man is in that frame of mind toward another it is hard work to get him to see the good that is in a movement such as our Hamilton Association. However, by getting together and finding out that what was one man's problem was usually that of another man, they have learned and are still learning the value of pulling together."

Meet Regularly

Meetings of the Hamilton Association are held every week. Three weeks in every month the sessions are at night and on the fourth they are held in the afternoon. The afternoon meeting is generally one of the best attended of all.

The members realized early the value of impressing upon all the plumbers the value and necessity of doing business in a business-like way. With this end in view, blackboard talks have been given in which actual business problems are figured out. The members are shown the best ways of figuring and of conducting business in general. They have seen the value of working along these lines and of cutting out ruinous price-cutting, and as a result of what they have learned there is perhaps fifty per cent. less price-cutting in Hamilton now than there was a few months ago.

Ban It Altogether

President Cunningham is working with the aim in view of having price-cutting reduced to an absolute minimum before long.

"We cannot get rid of this evil too soon," he said to SANITARY ENGINEER. "It has been responsible for a good many local men losing money that they should have made. We are working towards the 'open price' plan which has been adopted by the electrical men and I think it would be a splendid thing for all of us."

The Hamilton Association has under consideration some of the big problems not only of the trade but affecting public health. It keeps a very close line on conditions in Hamilton, and is in close touch with the plumbing inspector and the Board of Health.

Apprentice Problem

The problem of apprenticeship is not nearly as acute in Hamilton as it is in many other parts of the country.

"We can get any number of boys to go into the business," said president Cunningham. "We are working to give them the best of training through the technical school, and in this work we are securing the co-operation of the members. This is an important matter for the future of the trade, and we are working with an eye to the future and turning out of all around workmen. Very often we find men in the trade who have picked up the business and can only do one or two things reasonably well. If you put them at a new line of work they are lost. The training that the apprentices in Hamilton will get through the schools will end this and make for the production of better workmen.

Will Get Together

One of the things the Hamilton Association encourages in every way is the social side of co-operation. The members realize that by getting together, bringing their families and employees together and meeting one another, they can foster a spirit that will produce an understanding and establish the organization on a firm basis. This year an outing which will take the form probably of a picnic, is planned, and it is hoped to have all the plumbers of Hamilton and their wives and families in attendance. The Hamilton Association plans to go even further than this in the development of the social end of its work. Working from the basis that it is in the best interests of the Hamilton plumbers to co-operate not only with one another, but with their fellow craftsmen all over Ontario and all over Canada, they plan to get in touch with outside organizations and work with them in solving common problems.

The question of organizing a baseball team from Hamilton plumbers is under consideration, and it is hoped that this nine will be in a position to challenge Brantford and Toronto plumbers' teams to friendly games.

Craft in Windsor Organizing

Eleven Members of Trade Attend Initial Meeting—Addresses by Officers of Ontario Association

WINDSOR, Ontario, plumbers are organizing, and at a meeting held for the purpose of discussing what would be done, eleven members of the trade were in attendance. Michael Bryan was in the chair, and Chas. Paddon was appointed secretary.

A feature of the gathering was the visit of a number of members of the Ontario Society of Domestic Sanitary and Heating Engineers, including Messrs. Harry Farthing, H. Waterman, Fred Gentle, A. S. Purdy, P. C. Mansell, T. S. Kelly, Lew Palter, Harry Weinraub, Fred Wiles, W. Hall and Garrett Frankland, all of Toronto, vice-president George Grinyer, of Guelph, Andrew Malcolm, of Guelph, E. H. Russell, of London, Ont., and Clove Myers, of Stratford, vice-president of the Canadian Society.

Addresses were made by Harry Farthing, H. Waterman, George Grinyer, Clove Myers, Secretary Garrett Frankland and others.

Co-operation was the keynote of the addresses, and the Windsor plumbers were keenly interested in what was told them about the results that have been accomplished by organization in various parts of the province. The various speakers emphasized the importance of all plumbers getting together and discussing matters of interest to the trade. It was pointed out that in this way and in this way only can the problems that are constantly coming up be solved in a manner that will be satisfactory to all.

Secretary Garrett Frankland of the Ontario Association, is holding a series of meetings in different parts of the province with a view to steadily widening the work, forming new organizations and increasing the membership in those already organized. On Friday evening, May 9, he visited Guelph, and discussed organization matters with the Association there.

Mr. Frankland states that all the help necessary will be given to outside points, where organization is contemplated, if they will get in touch with him and let him know what is required.

Why Hold Back on Starting Building

Cost of Materials Should Not be a Deterrent Factor—Early Building Figures Showing Increases—Must be New Standard of Values—Meeting Higher Labor Demands Not Conducive to Lower Production Costs

IT is, perhaps, not a recognized fact, or, at least one that is admitted, but it is, nevertheless, true that building materials, comparatively, are lower than practically any other lines which may be mentioned to-day. Many plumbers are sitting back waiting for prices to come down, when they really have the greatest talking argument to sell goods that there is to-day. Building materials are relatively low in price this year, and to the plumber who goes after business aggressively, there should be abundant opportunity to reap a mighty substantial profit and incidentally encourage a return to building activity such as that experienced a few years ago.

Building Figures Show Increase

Figures, which have been compiled for the first four months of this year, show that there has been an all round increase in building permits issued so far, and that these could be stimulated by a little educational work on the part of the various members of the trade, there is no question of doubt. Figures which have been issued by 21 Eastern and 10 Western cities for the month of April alone, amounted to $5,368,422 in the aggregate, comparing with $2,952,-135 in April of 1918, which is an increase of nearly 100 per cent. The gains are pretty well distributed over the whole list, only 5 of the 31 cities reporting a lesser value than a year ago.

This is a desirable situation, and a very creditable showing, when it is taken into account that Government work on the various buildings and contonments required by the military forces are not a factor in these figures. Building figures during the past three or four years, whereas in some instances showing quite satisfactory totals, were inflated, due to the large volume which was devoted to the requirements of the armies of Canada.

However it can be quite safely said that many plumbers and other dealers, who sell to the various building trades, are sitting back, saying that there is no building, prices are high and still not really having a basis for complaint

when comparative figures are considered.

Why Hold Back on Building?

People to-day are buying meat at 50 and 60c a pound, which four or five years ago cost 20c, or perhaps 25c. People are buying clothing at $50.00, $60.00, or even $70.00 whereas a few years ago $18.00, $25.00, or perhaps $35.00 would represent comparative values. One can go all the way down the list and find that people are actually spending money on other classes of goods. Why then are they not going ahead with building?

If the trade would undertake an educational campaign they could do much to increase their own sales and incidentally work out some of the reconstruction problems which are before the country to-day. Too many retailers and others are content to sit back and wait for business to come to them, whereas business is really just sitting around the corner waiting to be approached. The man who sits back in his office and glooms away about the high prices of goods, when he should be out at the front selling goods, has only himself to blame when business returns do not go up as he would have them.

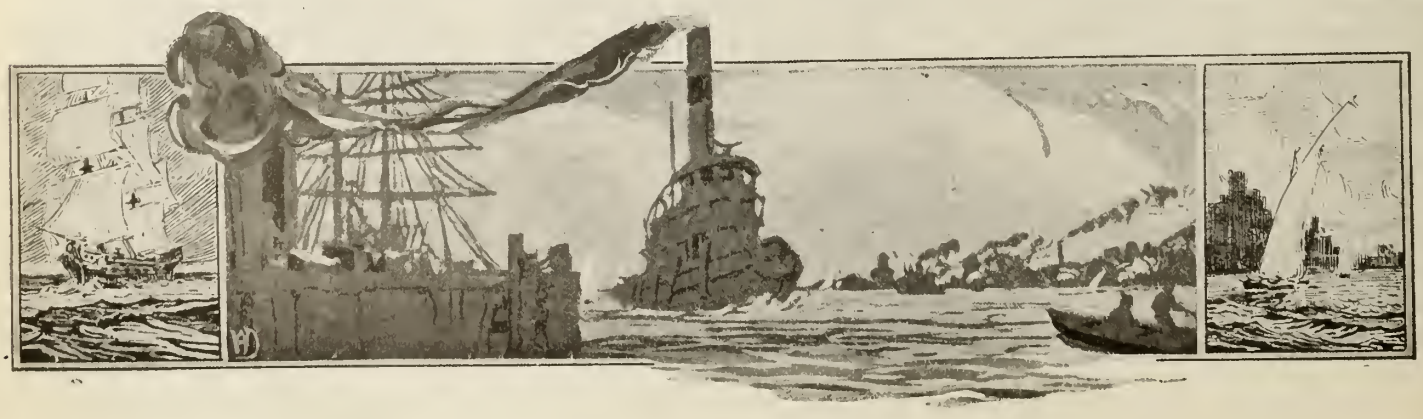
Keep Up Your Stock

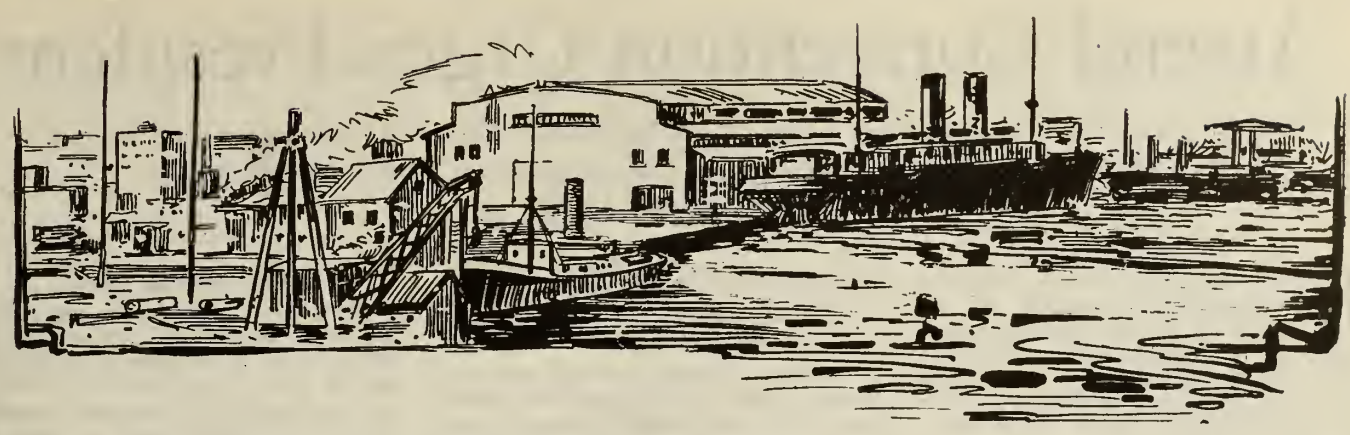
It is not the idea of SANITARY ENGINEER to urge dealers to buy goods in large quantities on what might be termed a more or less speculative basis. However, you cannot get away from the fact that if you starve your stock you must starve your business. This at any time is bad business. It may easily happen that while you are waiting for prices to come down 5 or 10 per cent., you may be losing business which will more than offset any little price decline which may be brought about.

It is true that there have been some lines decline but there has been no general slump reported. The attitude which some dealers have taken is that declines would come in the nature of a toboggan slide. The situation has advanced to such an extent that the trade should be pretty well away from this idea by now, and they should be following up business with a far more confident attitude than they have assumed during the past few months.

The Farmer Able to Pay

To those merchants who serve the farming communities, opportunities to develop business should be many. The arguments in favor of getting the farmer to buy are many. Look over the situation fairly and see what it shows. First, one might emphasize again that





building materials are relatively low in price. It might be well to point out that farm products, which the farmers sell to obtain building material, etc., are relatively high in price. Furthermore, building materials, including lumber, cement and lines more closely associated with the plumbing trade along with labor are not tending towards any material decline during the next year. Last, but not least, it might be well to point out to not only the farmer, but to other interests as well as that they will lose money by waiting to institute what are needed improvements.

During the past three or four years there has been a tendency to let even what should be termed as necessary repair work, slide. This is not a policy that can be continued to the advantage of any property owner for any length of time. This being the case, it might be well to point out that further delay, even should it result in buying a little more favorably, will probably more than be offset by the further deterioration to property.

Just recently a chart of comparative values was prepared by the Portland Cement Association on data supplied by the United States Department of Labor. This chart showed that building materials, by comparison with products of agriculture, mines and industry, are not high priced, and that now is the very favorable time to exchange these products for building. Taking the level of prices as 100 on January 1913, building materials in five years following show an advance of 35 per cent., while the products of agriculture, mines and industry show an advance ranging from about 70 to 105 per cent.

Actual Cost Materials Small

Look at the situation in another way. Take the actual cost of installing a proper plumbing system in a modern house. The cost of the material required when compared with the total value of the house is a comparatively small item. The big item entering into the situation to-day is labor and the demands that are being made by labor men all over the country are such that the price of manufactured materials cannot be readjusted to lower levels indiscriminately.

Take the case of lead products. At the mine lead is cheap, but what enters into the situation from the time mining operations start until you secure a piece of lead pipe. The labor which does the actual mining is securing increased wages; the transportation companies have increased their rates about 25 per cent., so that when the product reaches the manufacturer it has already suffered a substantial increase. The manufacturer is faced with increased production costs through the advances made to labor which have added very materially to the final cost of the finished product which he turns out.

New Standard of Values

It resolves itself into a case where a new standard of values will have to be adopted. It looks very much as though it will take some years before prices will reach a basis which can be termed as normal. That being the case, if the dealer is going to wait until prices reach pre-war levels it looks as though he has years ahead of him before he will be able to do business again.

It is not too much to say that prices cannot return to pre-war values again. There may be an odd instance where goods will decline and perhaps touch a pre-war level, but it is almost sure to happen that a re-action will occur and that these goods will finally be adjusted to a level considerably above figures prevailing five years ago.

There are abundant opportunities for business awaiting the aggressive plumbing and heating engineers. By lending support to housing schemes, which may be started in your own community; in giving the benefit of your experience in the selection of plumbing and heating systems and by urging builders to get started at as early a date as possible, the dealers will be sure to reap the benefit. There is no reason why delay should be the slogan of the plumber. The man who is out after the business can find it and it is just a case of getting out after it. Business won't come to the plumber, he must develop selling ability, and when he does this he is on the road to a successful operation of the business over which he presides.

What is Labor Situation?

Just consider the labor situation for a moment and see what it reveals. On every side, the demands being made upon the manufacturer call for higher wages. Labor men look at the high price they have to pay for food, clothing and other lines and base their claims accordingly. But, do they look at the other side of the situation, too? Do they realize that when they make these demands for increased remuneration, and get it, that another element to increase the cost of goods has immediately entered into the situation?

It is useless to ask that labor demands for a higher wage scale be met and at the same time urge that lower prices on the manufactured goods become effective. Labor enters into the production figures to too great an extent for such a condition to be brought about.

Working on Narrow Basis

In talking to a large jobber of galvanized sheets and kindred lines, who has been a consistent bear on the market during the past few months, SANITARY ENGINEER was told this week: "I have just returned from visiting some of the large mills in the Pittsburgh district, and while there I was given an opportunity of looking over the cost sheets of two of the largest factors. It was an eye-opener to me, and the mills are having a hard time to come out even on to-day's production costs. I am convinced now, from what I have seen, that lower prices on sheets are not a probability in the near future, if the element of production costs is the only one encountered. I have returned satisfied that present basis is a fair and equitable one, and will dictate my selling policy on that assumption."

This is only one line; it is more than likely other manufacturers could show comparative figures, which would be no less enlightening. It will be admitted that some classes of material used extensively in the promotion of war in any of its many phases did reach values that were inflated, but with very few exceptions the bubble has been pricked and quotations to-day are down more in line with actual cost to manufacture.

It is not the building material which represents the great proportion of cost in the construction of a house or factory to-day. The main factor is labor, and it should be well to bear this point in mind, for under present conditions it is not going to be possible to erect buildings at a lesser cost with labor demands showing such marked increases.

Attend Convention Urges President

Time is Ripe for Forward Step by Master Plumbers—Attend Convention and Become Informed on Timely Matters — The Plumber a Force for Battering Canadian Living

LESS than three weeks away the forthcoming convention of the Canadian Society Domestic Sanitary and Heating Engineers should be one of the thoughts foremost in the mind and in the plans of all members of the craft from coast to coast. United effort alone will make the convention the greatest success, whereas, if left to the few faithful, there cannot be that measure of success that is desired. Surely the master plumbers and heating engineers of Canada will see to it that this is a record convention, not in point of attendance only but in the measure of enthusiasm which characterizes it.

An Optimistic President

President Alex. Charette, Montreal, is in cheerful mood these days, and he says that the June convention of 1919 is going to be a winner. There is true optimism, and all that now remains, and which is decidedly necessary, is that all officers and members, no matter where they be located, should back the president to the very limit that his ideal may be reached. It goes without saying that the officers associated with the president will not fail him.

"I believe that the plumbers' trade is one of the best, if not the best in Canada," said Mr. Charette to SANITARY ENGINEER. "It is a business that the plumber should pride himself in. Let him remember that and come to the convention with this spirit. It is with him that the health of Canada rests largely, and he has a very important place to fill. Let him remember that health should be placed on a high plane, and if this be borne in mind the plumber will see what a force he is in the community's welfare."

Are You a Member?

President Charette believes that all master plumbers and steamfitters should join the local organization nearest them, and become members in good standing. "It is only when action is taken in this way," he said, "that the health of communities can be looked after properly. The health of all Canadian cities should be placed on a high plane. It will help much if you come to the convention to discuss these matters. By bringing your ideas and discussing with your fellow craftsmen the problems of the day as relating to the trade, there will be much good to all as a result. Delegates should come prepared to discuss matters freely. The better the discussions the greater success will the convention be."

The time is short for becoming a member of your local if you are not a member already. The active members have a real opportunity now to urge others to become members, and all who can persuade the other fellow who is outside to come inside by joining will be doing a double favor: one to the new member and one for the good of the cause. All should constitute themselves a committee of one to increase the membership, for there is not only strength in union, but there is power in numbers, if they be rightly minded. So, brothers all, take a day off and persuade Bill and Tom to come with you, and sign up. It's a great opportunity.

The Fighting Spirit

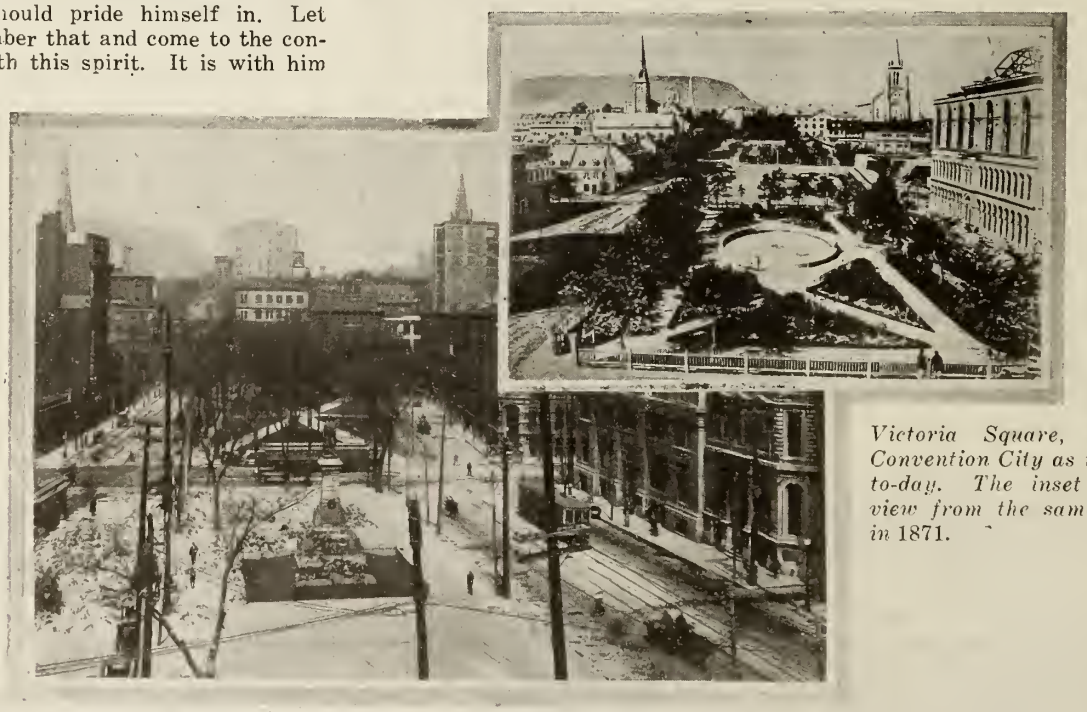
"You have fought in the Great War, and for all that which it stood for. The war, we must be thankful to say, is over, but the war of business is still with us, and we, as plumbers, should remember that we must fight hard to make our trade a success. There will be a big lot of building in Canada and a great many new problems, and the plumbers will need to consider these. The convention hall is a fine place to meet and discuss these matters. We should take advantage of every opportunity to make the trade what it ought to be, and co-operation on the part of all will accomplish this. Every plumber should boost for his own trade."

This sentiment of the president ought to be carefully pondered. It is not sentiment only, it is sound and constructive common sense which members of the craft will appreciate. His advice is most timely.

Indications are excellent, the president said, and some encouraging letters have been received. Other replies to invitations are earnestly looked for.

A Busy Secretary

While the executive at Montreal has been faithfully holding meetings it must be remembered that Secretary John Watson has had a big budget of correspondence to attend to, and he has been answering enquiries and giving out necessary information and facts right along. Some have not answered the repeated requests made by him, and this



Victoria Square, Montreal, Convention City as it appears to-day. The inset shows a view from the same location in 1871.

has but added to his work, requiring the doubling, trebling, and in some cases quadrupling of his written messages to dilatory officers far away. The response has been better of late, he states, and if those at a distance who have been prevented from writing will come to the convention there is no doubt that a welcome smile and a right glad hand will await them, for the Dominion secretary wears a big smile and will be discernible through it on June 4, 5 and 6.

The executive held two meetings during the week of May 5, and others are being held weekly.

"Come Everybody," Says Quebec Vice-President

"What we want is numbers," said J. E Walsh, the Quebec vice-president. "If we have numbers we shall have a good convention, there is no doubt about it. All plumbers will be welcomed whether they are delegates or not. The same free discussion on all questions will be extended to all, and the only difference is that the delegates are permitted to vote. We want a big attendance.

"Come with ideas and be prepared to discuss the questions that are brought up. Bring up questions of interest to the trade and there will be no doubt as to whether the convention is a success."

Mr. Walsh looks for a large representation from Ontario, and he also expects that Quebec will do well. It is a time when the boys ought even to make a sacrifice, if necessary, to get together on the topics that should interest all. Free discussion on the convention floors will clear the air and send all back with a new determination, a new purpose.

MONTREAL WELCOMES

Montreal will be declared a free city to the members of the craft if the spirit of President Charette prevails. His geniality will make all delegates feel at home.

Great assistance has been given the executive committee in its recent meetings, when preparations were under consideration for the convention by J. E. Walsh, elected to fill the vacancy caused by the death of the late R. J. W. Hughes. Mr. Walsh has had wide experience in convention matters in the past, and his assistance now is greatly valued by the president and secretary.

If you have never visited Montreal you have the biggest Canadian city yet to see. If you have visited it you will be glad to come again. Montreal leaves a good taste in one's mouth, and as a convention city it holds out many advantages. As far as the plumbers of Canada go, "The latch string's out."

Convention quarters are centrally located. They are within a few minutes' reach of Windsor and Grand Trunk stations. Easy access to the wholesale and retail sections of the city is also to be had. A real welcome awaits you at headquarters and you'll be sorry if you don't come.

From far-away Alberta come greetings and the best of wishes, Vice-President Marr of Calgary wishing the convention every success. The good taste of the convention held in Alberta several years ago still lingers. It savored of true Western spirit.

CONVENTION PROGRAMME

The programe for the convention of the C. S. D. S. and H. Engineers, to be held on June 3 and 4, 1919, at 101 Burnside Place, Montreal, is now available. This is as follows, and members are asked to keep the topics before them:

Programme

Tuesday, June 3

9 a.m.—Meeting of executive committee.
Reading and review of sub-executive work.

2 p.m.—Official opening of convention.
1. Report of credentials committee.
2. Appointment of special committee.
3. Reading of officers' reports.

8.15 p.m.—Theatre party.

Wednesday, June 4

9.00 a.m.—Opening session.
Reports of special committees.
Nomination of officers.
Selection of next place of meeting.

2.00 p.m.—Unfinished business.
New business.

4.00 p.m.—Reception supply house representatives.

8.00 p.m.—Paper on "Modern Vacuum Gravity Return and Home Steam Heating," by Mr. A. J. Dickey, general manager C. A. Dunham Ltd., Toronto, assisted by Mr. A. Kastello, manager Montreal office (illustrated with slides).

Thursday, June 5

9.00 a.m.—Election and installation of new officers.

Afternoon and evening—General entertainment.

God Save the King

Message From Saskatchewan President

President Roantree, of Saskatchewan Association, Outlines Some of the Aims of Body Over Which He Presides—Urges Co-operation on Part of the Trade

Action has characterized these Western members. Read what their president has to say to the trade as a whole.

"The SANITARY ENGINEER.
Toronto, Ont.

Dear Sirs,—On June 3 and 4 in Montreal, the sanitary and heating engineers of all Canada are being called together to their first convention since the Great War. During the time our country was at war, one and all of us forgot conventions and were willing to give our undivided attention to the winning of the war. Now that war has been won our thoughts are turned to reconstruction, and that means organization.

Speaking for the Province of Saskatchewan, we attempted nothing during war times in regard to organizing our province, but after it was over we lost no time in calling all the members of the craft together, and in Regina on February 12 and 13 we formed our first Saskatchewan Provincial Association, with some thirty members present from all parts of the province. The wisdom of such a move was very apparent simply from the very large volume of business brought before the convention to be taken care of during the coming year. It is going to entail some hard work but we have some good workers in our association, and I am satisfied we are together to stay, and will grow stronger each year.

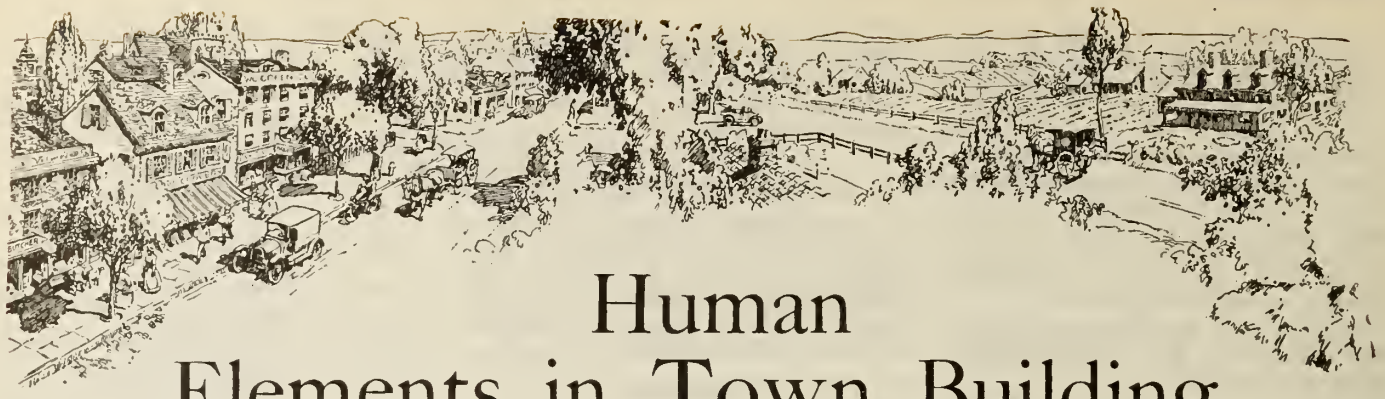
One matter taken up was getting out a uniform price book with both cost and resale prices, kept up to date with change sheets as required; these I understand are now finished and ready to send to our members.

Another matter was taken up and is of great importance—that of plumbing inspectors for the rural part of the province. It is the intention of the Government to appoint several of these inspectors, and we are petitioning the Government to engage practical plumbers for this work, some of our returned men that have been wounded and in such physical condition that they can never again take up their previous work, but would make ideal inspectors.

We are also after some form of technical training in the higher grades of our schools to teach the importance of sanitation as regards the plumbing and heating business as we feel that our business is as much a profession as a mere trade.

There were dozens of other matters taken up just as important as what I have outlined, and possibly more so, but we will not at present go into details. The one thing that I would like to impress on all sanitary and heating men of Canada is the absolute necessity of both forming their local society in every town and city and then form and join up with their provincial association, and with these formed by all means associate with our Dominion society, as the small fee of one dollar per capita tax should keep no one out.

Yours sincerely,
N. B. ROANTREE.
President Saskatchewan Assoc.
of S. and H. E."



Human Elements in Town Building

By A. H. Melville, Madison, Wisconsin. Chief Bureau of Civics and Commerce and Associate Professor of Business Administration, University of Wisconsin.

IN the discussion of problems of town building, problems that are being considered by many municipalities at the present time, there are material considerations to be taken into account without doubt, but above these factors is the far greater factor of the men behind the cities. The accompanying address that strongly urges these points was delivered at the Second Annual Short Course on Merchandising held at the University of Manitoba, Winnipeg.

A TOWN is just as large as the territory it draws business from. No longer can a city hide behind the cloak of its city limits and say—I am not interested in anything except what is within my gates. City limits are only boundaries for municipal government. In building a city, therefore, we must recognize in a constructive way the interests of all the people we serve in commerce, in trade, in agriculture, in recreation, in matters of health. I believe it was the veteran Cyrus McCormick who recently remarked to a group of bankers and business men that the prosperity of farmers in their community is the measure of their sales in business, and the late Theodore Roosevelt, who recently writing in connection with the League of Nations, said: "If this old world of ours is going to be a good place for some of us to live in, it has got to be a pretty good place for all of us to live in."

Our civic, commercial and educational interests are so interwoven and interlocked that we can scarcely consider the welfare of one line of business without reckoning with all the others. If we have factories with efficient working men, they must have sanitary, cleanly homes to live in. They must have recreation for themselves and their families. If we have progressive, contented, satisfied farmers, good farming implements, markets to care for their grain, and modern stores to take care of their household needs are implied.

The Human Touch

In this busy hurly-burly world of ours, this age of wireless telegraph, 100 miles an hour automobiles, 70 miles an hour trains, fast aeroplanes, 90 miles an hour business and three editions a day newspapers, men are losing the personal contact of man to man and the human interest that goes with it. We rush hurriedly to business in the morning and back again at night, to committee meetings, speaking for a moment first with this man and then with that man, but never knowing really the man with whom we meet and deal. We are busy in our stores, we cannot cultivate friendship of our customers. The other day, to my surprise, I learned that a prominent man with whom I have been sitting on committees lived only a stone's throw from my own door. The magic touch of personal interest so common a few years ago seems gradually to be slipping away. And yet, if we are to build our cities constructively, not for to-day or to-morrow, but for years to come, we must know the men who live in them and their capabilities, **for it is men who make cities.**

The other day some misguided man in Minnesota caused the failure of a chain of fourteen banks. The newspapers heralded it half way across the continent. Not a few people immediately said to themselves, "I wonder if my bank where I do my business is safe? How about my savings and earnings, are they all right?" and again we see how interdependent business is and how much the success or failure of one unit affects all the others. And not only that, but it affects the town or city in which the failure takes place and its reputation, for cities have a reputation and character just as individuals and firms have.

Now towns are competing with one another for business just as business men in the same line of business compete with one another. A town is known by the reputation of its business men, by the reputation of its schools, by its libraries, by its health, by its recreation facilities and judged accordngly. If we are to build a town, we must know its resources and liabilities. We must take stock of what it has to offer to the people who live there and who come there to trade, just as the merchant takes stock every so often to see what he has and what he is out of that he must supply. We must analyze our own community critically, face the facts and act according to what the analysis shows. One town is short a good retail store, another a blacksmith shop, another a good hotel.

A Need for Executive Action

A meeting of this kind here to-night fifteen years ago would have been absolutely impossible. Business men did not get together then as now. They feared each other and were not willing to trust their competitors. Perhaps they did not realize the necessity for collective action. No town, or city, or community can be really and truly prosperous and contented unless the people get together frequently in social intercourse and exchange ideas and opinions on matters of public interest and business. Rome and Greece had their public forums at Rome and Athens where the wise and unwise gathered together and debated matters of public policy. For centuries 2,500 to 3,000 years ago this custom prevailed, and who shall say they were not the most progressive cities of their age? The creed of the Athenian youth, the free born British youth can be proud of to-day:

"I am a citizen of no mean city.

"I will never bring dishonor or disgrace upon my city, nor desert my suffering comrades in the ranks.

"I will fight for the sacred ideals and standards of my city both alone and with many. I will respect and obey her laws and seek to impose a like obedience and respect upon the part of those above us who are prone to annul them or set aside. Thus in all ways will I seek to transmit my city, not only not less, but greater, more beautiful and better than it was transmitted to us."

The winning of the world war is the finest example of collective co-operative effort that is recorded in history. One nation could not win the war. Nor could two nations. It took the combined effort of all the liberty loving nations directed under central leadership to strike the blow at militarism which has made the world safe for Democracy. The fruits of the victory we shall enjoy and shall we not carry this lesson of constructive co-operation into our constructive city building?

Two years ago, John Barrett got the Central American Republic together for monthly meetings in the beautiful Pan-American Building at Washington, where the representatives of these countries could meet and know each other, rub elbows, sit at a common table and discuss common interests and common problems in a frank and honest fashion. The result is that instead of a new revolution or war breaking out somewhere in Central America every morning before breakfast, they haven't had a war for two years and a half.

But we must organize if we are to get results. I have noticed that there are three types of institutions in towns that are supposed to represent the business man's, and incidentally the town's, interests:

1. The small business organization designed to give credit information and undertake collections.

2. The business men's organization for developing trade and commerce only and which usually includes the one already named.

3. The big, broad, institution which includes all the interests of the other two and which is big enough and broad enough to include every interest of the country; its commerce, trade, education, recreation, health and agriculture. This is the kind of a body that is building towns for not only to-day, but for the future.

The Men Behind the Cities

Call the roll of cities in the United States and Canada that are doing things

and you will invariably learn that back of them are bodies of educated men that are giving their time unselfishly and generously to building up their cities. Such men have in mind that boys and girls have value in a community as well as wheat and oats, lumber and other commodities. A town which is a better place to rear a family in, a town which is a better place to raise boys and girls in, to develop manhood and womanhood, to build character in, without which business would be as unstable as a rope of sand, is a better place to do business in. And these same men are willing to give some of their time, some of their energy and some of their money to get these results.

Most towns have an idea that a factory is the only thing that can build a town. They forget that towns develop from within out. They want trade and so they buy a factory to come to town to furnish employment for labor and more business. In nine cases out of ten, the factory that wants a location will come to your town if you have the physical requirements for it to run without buying it. And if you buy it, later on the chances are you will find it "a fly by night" and you must pay the fiddler.

A live business men's organization furnishes the facilities for looking into these matters carefully. Let us pass rapidly among our large cities and see what problems they have had to meet and how they met them:

Chicago got her boulevard and park system through the efforts of one of her citizens who appeared before the City Council persistently for ten years. It has been built up commercially largely through an active business men's organization.

Cleveland has become a great city of play grounds through organization. More homes are owned in this city for its population than any other in the United States. A great Union Depot was the result of seven years' effort.

Memphis, through its agricultural committee, is changing the State from cotton to diversified farming. They found that milk was being shipped from Wisconsin to Memphis because they did not have dairy cattle in the State to meet their requirements.

Little Rock—The agricultural committee found that two years ago in Arkansas they were receiving sixty million a year for cotton but were spending seventy-two millions a year for feed that she should have been raising. Since then, 2,900 meetings were held in one year to bring about a change.

In Waukesha, a city of 10,000 people, the business men and bankers loaned farmers money six years ago to buy pedigreed dairy stock and erected a stock pavilion. In 1918 the farmers of this district sold 180 carloads of pure bred and grade dairy cattle amounting to $320,000.

In Ashland the business men and bankers financed farmers after the district had gone to pieces because the lumber was gone. The result was that cheese factories and creameries sprang up all over that district.

At Fondulac, a body of bustling business men invited 1,242 farmers attending a country institution to sit down to dinner with them.

In Wisconsin, seventeen towns from 500 to 2,000 put in rest rooms last year.

"Yes," you are saying, "that is alright, they can do it in towns where they have plenty of money and a paid secretary, but how about small places where little or no money can be raised? How about little towns without any vision?" Mr. Melville then told his audience about a little town of thirty-five people—they did things regardless of population.

Lakefield, Minnesota, accomplished all that it has done through the co-operation of the business men and the farmers. It has a real, live commercial club. It is co-operation and energy that does these things. Never run down your own town, especially to strangers. Boost it, make it the best town in your county—your county the best in your province—your province the best in the country. All we need is more vision, pep and initiative.

VISION

Then vision forth what here you most desire.
Dream of industries and busy marts of trade.
Dream of traffic, dream of wealth, dream of parks and playgrounds—of happiness, content.
Dream of contented labor at its task;
Dream of smiling women and better men;
Dream of homes where laughing children play;
Dream of a city beautiful and fair.
Think and plan as others have for their accomplishments,
Then work, work for contented labor at its task;
Work for smiling women and better men;
Work for homes were laughing children play;
Work for a city beautiful and great, and
Make your city a place where dreams come true.

The Importance of the Cash Discount

Details as to How It Looks Outlined—When Custom Abuses Principle—The Trade Acceptance

WALLACE D. Simmons, president of the Simmons Hardware Co., of St. Louis, has published a pamphlet entitled "The Importance of the Cash Discount in the American Credit System," in which he strongly opposes trade acceptances.

Explaining the origin of the American system, Mr. Simmons says:

"The wholesale merchants who worked out the American open account—single name paper—cash discount system recognized the risk involved in one type of credits as compared with another. They offered to the pioneer merchant of limited capital every assistance and facility to enable him to build up his business rapidly, to make it profitable and to get on a stronger financial footing. They gave him every inducement and encouragement through that course to get in position to pay his bills promptly upon receiving them, and in line with that policy they offered to the man who was in a position to eliminate or minimize credit risks, compensation for so doing. This was a practical, sound and farsighted adaptation of the idea of mutual or group credit insurance. The manner of working it out was somewhat unusual, but the principle was there and the effectiveness. While the situation in this country has changed somewhat, and at present materially differs in some sections, careful study will show that the difference is not so great after all."

Mr. Simmons says that we should keep carefully in mind the principal elements of the cash discount system, which he thinks are the following:

How It Works

First—That the cash discount is distinctly a quid pro quo. It is a price paid for a distinct value received. The quid is the amount of the discount allowed. The quo is the shortening of the period of credit risk effected by the payment of the account on or before a definite date much earlier than its net due date. The discount represents the value of the use of the money for a definite period, plus the value of eliminating the credit risk by final settlement of the account within a period very much shorter than that of its net due period. On terms sixty days, with 2 per cent. cash in ten days, it means that the debtor has the alternative of paying the bill in full sixty days from the date of the invoice, or he has the option of deducting 2 per cent. provided he places the funds in the hands of his creditor, so as to release him from all further risk at least fifty days before the account is due and payable. Two per cent. for fifty days is practically at the rate of 15 per cent. per annum.

When Custom Abuses Principle

There is, however, abuse of the "cash discount" plan to which I wish to refer. At least it seems to me to be an abuse of the principle involved and by those who can ill afford to abuse it—I mean those who offer the discount to others.

I refer to the custom of making the terms of credit so short and the so-called "cash discount" so large, as practically to make the terms net cash. It is either abuse or the evidence of conditions existing in that line of business which create extreme credit risks.

For instance, in some lines of merchandising the usual terms now are 30 days with 5 per cent. or cash in 10 days. That practically means that no man who cannot discount can afford to stay in business. His competitors with more capital, will buy goods under those circumstances so much lower as to make it only a question of time when they will force him out entirely.

A differential of that kind is not a "cash discount" as I see it. It is simply going through the motion of offering a "cash discount" but in reality selling goods on terms—10 days net.

I have no quarrel with the man who makes his terms 10 days net—and hence offers the goods only to those who have or can get ready cash to pay for them. I do quarrel with any plan which makes it very difficult, if not impossible, for any small merchant to do business in this country unless he has sufficient capital to buy all his goods for cash. I am a great believer in giving the able, thrifty, industrious young man of small means a chance to branch out for himself. I believe the American credit system gives just such an opportunity with adequate protection to all interests involved. I believe that plan is in line with one of the basic ideals of

EDITORIAL COMMENT

ARE YOU BOOSTING BUILDING?

ON every side one hears the cry when building is mentioned that costs are too high, materials are out of all proportion to enable much construction work to be instituted. But does an investigation of the situation really reveal the fact that building materials are too high? Take the actual cost of the materials entering into the construction of a house. Should the cost of the plumbing and heating used be a deterrent factor—isn't the plumbing and heating bill really a comparatively small factor in the total cost?

What, then, is the main element to-day? Nothing more nor less than labor. With every branch of labor demanding more, does it seem reasonable to expect that prices can come tumbling down? Doesn't labor enter into manufacturing costs to a great degree, far more usually than the raw material? How then is it possible to sanction increased wages to labor and at the same time urge that cost of goods representing the fruits of labor should be reduced?

Putting off building is not going to help the labor situation. Nor is it likely to result in a saving of any great amount to the builder in the matter of the materials which he depends upon the hardware dealer to supply. It is better to face the situation fairly—look at every angle carefully. When you have done this you will be more inclined to urge that building be gone ahead with. The result will be that labor will be employed—it will be a business producer and will stamp you as a citizen who has the best interests of the community as a whole at at heart. If you are not already, start now being a building booster.

THERE is a big difference between practising strict economy and being penurious.

PHONE RATES INCREASED

THE Railway Commission after going thoroughly into the request of the Bell Telephone Company for increased rates has tendered a decision in which the company is given permisson to inaugurate a new schedule for long distance and make an advance of ten per cent. in exchange rates. The Bell Telephone Company requested a twenty per cent. advance for exchange rates. Merchants all over the Dominion are keenly interested in this matter. While there has been considerable objection in many places to any advance in telephone rates it was mainly on the ground that the service rendered was not commensurate with the existing rates. One of the things which many merchants will probably demand if their rates are increased ten per cent. is a greatly improved service. The company in its arguments for making an increase pointed out that rates must be higher if the service was to be maintained. The rates are to be increased, so now the merchants and business men will certainly be justified in looking for improved service. The need for this in some of the rural districts need not be dilated upon. All those who have had any experience in trying to get connections have had reason to remember what occurred. It will now be up to the telephone company to see that these troubles are eliminated.

LITTLE that is worth doing has ever been accomplished without the driving power of enthusiasm.

IT'S WORTH IT

MANY people, including merchants, imagine that it is an easy thing to sit down and write an advertisement. It is anything but an easy proposition to write the right kind of an ad, the kind that will produce sales. It takes time and thought but it is worth the effort every time. There are men who can sit down and write ads easily. There is one thing that makes it easy for them and that is that they know all about the goods. They tell all the good points there are about the goods and they tell them simply and directly. These are the kind of ads that pull. So many writers of ads imagine that in order to inject sales punch into an ad they must use a lot of highbrow words and classy language. There never was a bigger mistake. That sort of stuff goes right over the head of Mr. Average Buyer. He passes it by because he cannot see quickly what it is all about and he reads something that interests him. The most forceful ads are those that are simplest. To write good ads you must know all about the articles you expect the public to buy. The little details often carry the whole interest from the purchaser's standpoint. The best ad writers always make sure that the heading arouses interest. Then they try to make their general talk maintain that

interest throughout. There are certain things every prospective buyer of the articles you are advertising wants to know. Tell them briefly and in simple language. Put in a few illustrations, give the prices, make a nice arrangement and there you are. Study the ads of the best advertisers, the mail order houses and other leaders in advertising and you will constantly get ideas you can adopt. It means work to do this and to keep your advertising message to the public newsy and interesting, but it can be done and the results are worth the effort.

ON A SOUND BASIS

IT is rather gratifying from the standpoint of the trade in general to find so many retail firms suffering from growing pains. At a time like this, the reconstruction period following nearly five years of the fiercest war that has ever been waged, it means a whole lot for the future of the Canadian retail trade to find so many firms whose quarters are too small for them. Business has been and is so good with them that they need larger stores. They are awake to the possibilities of doing a bigger business and are laying their plans for taking on new lines and increasing their turnover in the line they are already handling. "I have never known the retail trade to be on such a substantial basis as it is to-day," said the auditor of one of the largest firms in the Dominion. "The dealers as a whole have come through the war period not only in splendid shape, but better merchants because they have learned so thoroughly how to deal with business problems."

THIS SHOULD BE REMEDIED

IF reports regarding the handling of the British mails after they arrive on this side of the Atlantic are even approximately correct, a situation exists that should be remedied as quickly as possible. The postal service is so closely related to business that quick handling of all mail matter may mean large sums in actual money to many merchants and business houses. Delays are always annoying and costly. Yet it is reported that there is sometimes a delay of from four to five days in mails reaching their destination because they have after reaching Halifax to be sent to New York and then back again. One cause is cited where a steamer carrying British mails reached Halifax on a Saturday afternoon, but the letters from that boat did not arrive in Halifax for distribution until the following Saturday and then by way of New York. Things of this sort point to the need of a new head for the Canadian postal service. Dr. Coulter, who has been in charge for many years, was a village doctor without business or post-office experience. He was given the job over many capable men, men who had grown up with and were thoroughly familiar with the department. The appointment may have been a reward for political services rendered during elections. This sort of thing would not be tolerated for a moment in any progressive private business. The postal service is one of the most important departments that the Government has to deal with and if it were put in charge of a good business executive, and there are any number of good men in the postal service, there would be more efficiency.

IT'S THE NET THAT COUNTS

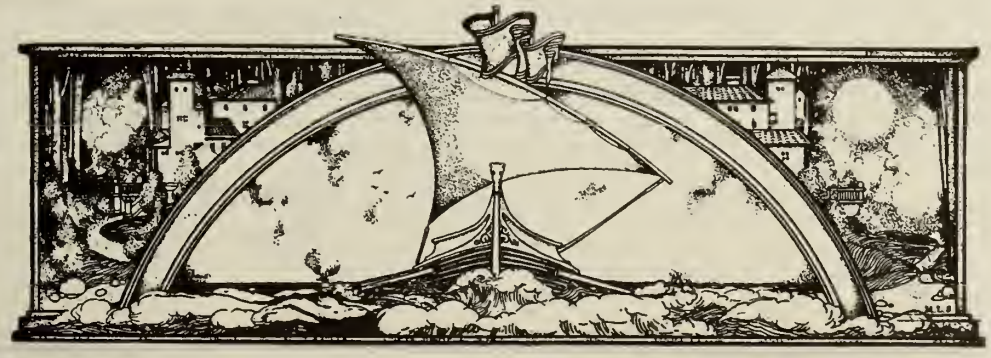
Mr. Dooley was one of the leading restaurant keepers in a small town. Recently he purchased a cash register. The documents of the first trade to be recorded were a 27-cent check and a five dollar bill, the proud proprietor rang up $5.00 and paid out $4.73 in change. When the next customer presented his check it was for 35 cents and a $10 bill was passed over the counter. Dooley operated on the $10 key. Thus things progressed throughout the day. That night, upon checking up, he discovered according to the machine that he ought to have $250.00 on hand, although a careful inventory revealed only $17.30.

"Terrance," said Dooley to his assistant, "have yez taken anything out in the new cash machine to-day?"

"Shure," said Terrance, "I took me carfare home."

"And where d'yez live," inquired Dooley, "Australia?"

Like Mr. Dooley, many a man in charge of a business is ringing up gross profits without the faintest idea of what his net profits really are. And like Mr. Dooley, if he keeps on hammering the gross receipt button, he is "going to have a disappointment in his life," as the fortune tellers say, for after all it's getting the net that counts.



PRACTICAL SHEET-METAL WORK

THREE PIECE ELBOW WITH GUSSET OR GORE PIECE.

BY THOMAS STANSFIELD

THE article for which a pattern is to be developed is that of a taper piece to fit around an iron chimney, which has to be placed through the ridge of the roof. Many times it is found to be a little difficult to flash and make water-tight such a chimney so placed.

The elevation, Fig. 1, is first drawn and the pitch of the roof determined as shown at A B C. The length of the taper is next procured, D E, making A D and E C represent the true length of the taper, with B showing the height of ridge as well as centre of the taper piece.

Next draw the plan, Fig. 2, by first extending the line B down to any convenient point, as at K, and using K as centre of plan. Next draw a number of vertical lines down from H to point 9 and J to point 1.

Now divide top half of the plan into equal parts, 1, 2, 3, 4, 5, 6, 7, 8, 9, point 5 being on centre, and erect vertical lines until the solid line H J is reached. This completes the full plan and elevation.

For convenience, a quarter of plan and half the elevation is now drawn, from which the pattern may be developed (see Fig. 3). First draw dotted line A B, which represents the centre, and upon this line draw the half elevation and quarter plan, the exact size of Figs. 1 and 2. In the same manner, and with A as centre, draw an arc from C, which is the stretchout line. Next transfer the measurements, 1, 2, 3, 4, 5, etc., to this arc, and from each of these points draw a line that meets at point A.

Now draw a number of circles as shown by dotted lines, from the various points on side of taper piece, again using A as centre. The solid lines D E F G H show a half pattern, which may simply be turned over at D G or H E on the metal and marked off. The same method is followed out no matter what the taper be, or even the pitch of the roof. Allowance for flash on roof should be made, which is not shown; this would require to be peened down to fit and either riveted, soldered, or both. Allowance is shown for the side seam.

VENTILATING THE MODERN SCHOOL

Third Article of Series Written Especially For "Sanitary Engineer" by N. A. Kearns—First Article of Series Appeared in April 1 Issue

TO THE person not satisfied with working in a rut, the study of systems of ventilation becomes a most absorbing pursuit, and when in his zeal for the gathering of information he reads every article that comes to his notice that has any bearing on the matter, he is almost sure to be impressed with the general agreement that exists regarding the importance of air movement.

While details of design may differ in their application, we may safely say that there are only two schools of thought differing radically in the opinion of what constitutes air fit for breathing.

One of these schools claims that air once breathed is poisonous because of chemical change that has taken place in its constituents. The other school contends that air can be breathed over and over again if it is properly conditioned by the regulation of its temperature and humidity and by washing it free of odors, dust, and poisonous gases, but no matter how much the representatives of these schools may differ in some of their opinions, they all agree that the air surrounding the occupants of the room must be kept in motion.

Some writers on hygiene claim that a "draught never hurt anyone," and that it is better to sit in the draught than to breathe stagnant air. These men prove their contention by exposing themselves to draughts on every possible occasion and glorying in the fact that they never catch cold, and if we did not know that their other habits were conducive to the building of a vigorous constitution we could believe that they were proving their argument. However, we know that the average person is affected by sitting in a draught, and as it is the average person that we have to provide for we will, if we are conscientious, make sure that the ventilating systems that we are designing will not cause draughts.

One might ask, "What are draughts?" And as in the design of ventilating plants a knowledge of air velocities is required, we will take the opportunity of answering this question by providing the following table:

Feet per Minute	Description
88	Just noticeable
176, 264	Noticeable
352, 440	Gentle breeze
880, 1320	Pleasant breeze
1760	Gale
2640	High wind

Now it will be noticed that air travelling at a velocity of 264 feet per minute is noticeable, so if we have air coming into a room anywhere near the level of the occupants of that room the velocity of the air should not be anything in excess of 264 feet per minute; but if we have made provision for air to enter the room at a point or points situated at some distance from the occupants, say 9 feet above the floor level, we could proportion the fresh air openings so that the air might enter the room at a velocity of from 400 to 500 feet per minute.

If the flue leading to a fresh air face should be small in proportion to the face, a very unequal discharge of air would flow through that face; so we proportion the fresh air flues for an air velocity of from 500 to 800 feet per minute.

When we are using a pressure fan we generally proportion the branches that connect the fresh air flues and the main ducts for an air velocity of from 800 to 1,200 feet per minute.

The main horizontal duct should be proportioned for a velocity of 1,500 to 2,000 feet per minute, this velocity being proportioned to the distance that the air must travel from the outlet of the fan to the outlet in the room. And where the horizontal duct connects to the outlet of the fan it should be of an area equivalent to one and one-fifth of that of the fan outlet.

If we intend to design a gravity system of ventilation, using indirect radiators for the heating of the air and proportioning the air-carrying flues to the usual velocities found in gravity systems, we make use of the following table showing the quantity of air in cubic feet discharged per minute through a flue with an area of 1 square foot. The external temperature is assumed at 32 degrees Fahr. and there is an allowance for friction of 50 per cent.

Excess of Temperature of Air in Flue Above That of External Air.

Height of flue in feet.	10	15	20	25	30	50	100
10	108	133	153	171	188	242	342
15 ...	133	162	188	210	230	297	419
20 ...	153	188	217	242	265	342	484
25 ...	171	210	242	271	297	383	541
30 ...	188	230	265	297	325	419	593
35 ...	203	248	286	320	351	453	640
40 ...	217	265	306	342	375	484	684
45 ...	230	282	325	363	398	514	724
50 ...	242	297	342	383	419	541	765
60 ...	264	325	373	420	461	594	835

Now we have some idea of the things that have a bearing on the proportioning of the sizes of the outlets into the rooms and the size of the vertical flues for either a gravity or a fan system, also the sizes of the horizontal branches and ducts in a fan system of ventilation.

Now we come to the point where we select the fan, and for the sake of illustration we will assume that we are designing a ventilating system for an 8-room school, and that each room has a seating capacity of forty pupils. We therefore have a total of 320 pupils, each requiring 30 cu. ft. of air per minute. The total air requirement is then 12,800 cubic feet per minute. Now it would not be safe to specify a fan of that capacity only. We must provide for the loss occasioned by leakage and friction so we specify a fan with a capacity of 20 per cent. in excess of the actual requirements, viz.: a fan with a capacity of 15,360 cubic feet of air per minute.

When we refer to fan manufacturers' catalogues we find that the capacities of fans vary with the speed at which they are run, so before specifying a fan we must decide on the speed best suited for our purpose.

If we run the fan at too slow a speed the velocity of air travel in the main duct will be so low that there will not be sufficient pressure to offset what might be termed local circulation, and again, if the fan is run at too high a speed we are likely to have a noisy installation.

There are several ways that we might take in finding the size of the fan best suited. We might work back from the ducts to the fan, thus proportioning the fan to the ducts, or we could work from the fan to the ducts, proportioning the ducts to the fan selected. In either case we would find that we had decided on the same size of fan.

In an 8-room school the horizontal ducts are not very long and therefore we can assume a fairly low velocity in our main ducts, say 1,500 feet per minute, and as we have assumed that these ducts are to be of an area 20 per cent. in excess of that of the outlet of the fan, we may select a fan with an outlet velocity of 1,800 feet per minute, and a capacity of 15,360 cubic feet of air. There are several other factors that enter into the selection of a fan, but as fan manufacturers, with a few exceptions, design their fans so as to maintain a proper ratio of fan outlet to the diameter of the fan wheel, and to the top speed of the same, we can generally work from the assumption that the fan outlet is properly proportioned.

After selecting our fan we may estimate the amount of indirect radiation required, and here is something that air velocities also have a bearing on. In designing our ventilating plant we must provide for the assembling of indirect stacks in such a manner that the velocity of the air travelling over these surfaces will be neither too high nor too low. Usually in school work we figure that the air should not travel through these heaters at a higher velocity than 1,000 feet per minute.

In a gravity system a velocity as high as this will not be obtained, and it is for this reason that we must increase our indirect radiating surface over that used in a fan system of ventilation.

The article following this describing this in detail, the system of ventilating an 8-room school, will be illustrated with drawings of the work as installed.

RECENT REGISTRATION

The Modern Plumbing and Heating Co. has been registered in Toronto.

The plumbing firm of L. C. Martineau & Co. has been registered in Montreal by Louis C. Martineau.

Heating and Ventilating

THE BOILER

Fourth Article of Series Prepared for Readers of "Sanitary Engineer" by N. A. Kearns

Editor's Note.—This article is the fourth of a series prepared especially for the readers of SANITARY ENGINEER, covering heating and engineering practice reduced to its simplest terms. Readers will find this article on the "Boiler" a most interesting and illuminative one. The first article of the series appeared in the April 1 issue. Descriptions of installations made in different classes of buildings will be given, together with the method used in making the designs for these installations. It is not our purpose to give complicated formulas, but rather to present the simple rules that have been based on these formulas, in such a way that the reader will be enabled to design a heating and ventilating system without having to refer to the data given in engineers' hand-books. The author of these articles, Mr. N. A. Kearns, has designed heating and ventilating equipment for all classes of buildings in practically every province of the Dominion. Some of the buildings were such that the heating and ventilating equipment had to be installed under the most adverse conditions, whereas in other buildings the design for the heating and ventilating equipment was incorporated in the constructional drawings. The fifth article of the series will appear in the next issue.

IN presenting these articles to the readers of SANITARY ENGINEER it has been the writer's aim to take up the various phases of the practice of engineering in what seemed to be the order of their value. It has been, at times, difficult to draw a line which might define the relative importance of any part of the profession, and because of this very difficulty, some of the things written here may appear to be out of their proper order.

The first article covered the use of the British Thermal, or heat units. It was given first place because the writer believed that a thorough understanding of that factor was of the greatest importance to one desiring to study the science of the heating ventilating or refrigerating engineer.

The second article dealt, perhaps in a more or less indirect way, with the faculty of common sense, and the article was entitled "Comparative Standards."

The third article related to chimneys. Many of the heating brotherhood believe that to be the detail most worthy of first place.

If the cost of the material had been the controlling factor in setting a priority of subject matter it is likely that the first article written should have dealt with boilers. It is not because the boiler is less essential than the subjects that have already been written of, that has given it but the fourth place in this series. This article has been put in a fourth place in the series so as to, in some way, accentuate the statement that almost any of the boilers that have been on the market for at least five years have certain merits peculiar to their individual types, and also to the fact that the particular excellence of certain types of boilers may be rendered ineffective because of their installation under the wrong conditions.

A boiler suitable for installation in a small factory might, under different circumstances, be used without fear of failure in a school building, but at the same time a consideration of the requirements for the school heating apparatus might lead one to make a recommendation for the use of a heater differing in every respect to that installed in the factory building.

In the article appearing in this magazine, regarding the ventilation of schools, reference is made to the curse of the closed mind. Some men can never look at anything without visions clouded by prejudice, and until such a time as they cease cherishing their oblique visions they cannot hope to learn anything new.

Prejudice in regard to certain apparatus is at times generated because of some annoyance that these men have had through misunderstandings, either in the way of business with the manufacturers of such apparatus, or an experience they have had in the difficulty of making some particular installation. Prejudice grows fat with nursing, so that even in the face of the success of a certain type of boiler they can only see its faults. Because of the malicious ignorance bred in that type of mind, thousands of dollars are wasted in the making of heating installations unsuitable for certain requirements.

The vigorous work of heating salesman is not always confined to the introduction of their own goods. Often with considerable force they make erroneous statements regarding a competitor's goods, and with fragmentary knowledge and the insolence bred of ignorance, repeat over and over stories of troubles that someone has had with a certain type of apparatus. They do not seem to realize that frequently they miss the purpose of making sales when they spend so much time in worrying over their competitors' troubles. Perhaps there might be some truth in the statements regarding the annoyances that someone has had with a competing boiler, but as a general thing these salesmen could, if they wished to be truthful, place the blame on the conditions of an installation that made that competitive boiler unsuitable for the work.

Occasionally an engineer or an architect is so closely associated with manufacturers of boilers that the so-called "open" specifications are nothing more nor less than a description of one certain type of apparatus. No matter what class of building they may have in hand, they persist in using an old specification as a copy, until its edges grow ragged and its print becomes blurred from constant usage. Often they use the same type of specification because some experience has led them to the belief that one type of boiler is the best for all conditions, and as a result of this, they often specify a boiler suitable only for the use of hard coal in a district where wood and soft coal might be very cheap; or they specify a soft coal-burning boiler in a residential district, where hard coal is easy to get. They might even specify a boiler, whose great merit is that it runs for hours

without attention, in a building requiring heat for only a few hours each day, and that at long intervals.

Recommendations made by the writer are entirely unbiassed. He has no axe to grind, and his belief is that there is no type of boiler on the market to-day that is suitable for every class of building, or for every location.

It is a well-known fact that the more things are specialized for a purpose the less effective they become under unfavorable conditions. We may take, for instance, such a construction as results in the hot gases being broken up into small currents for the purpose of extracting every available heat unit. Now, that in itself is a good feature, but if a boiler constructed on this principle should be connected to anything but a very high chimney, its flue areas in a short time become so choked with soot as to render ineffective its very merits. This is just taken as an example to illustrate that points of excellence may, under the wrong set of conditions, lead to inevitable annoyance.

A volume might be written on the boiler alone. There are so many things to be considered that a study of a lifetime would not place us in a position where we could learn all there was to know about this particular apparatus. Boiler concerns spend thousands of dollars every year in experimental work in an endeavor to increase the efficiency of the boilers that they are selling, but still with all of this they have only proved the existence of a few outstanding guiding principles in boiler construction that the engineer may use in selecting the apparatus fit and proper for the work to be done.

We being interested in heating boilers alone will not attempt to take up in any way the subject of those used for power purposes.

Perhaps it might be well to refer to the rating of boilers before mentioning any type of apparatus now on the market.

Some boiler manufacturers publish two ratings in their catalogues and this practice makes it not only confusing to one when making a selection of the boiler, but it is also misleading to one whose impatience will not permit him to note that the higher reading of the two ratings is based on a low radiator efficiency.

When a boiler is rated at a capacity of 4,000 square feet of direct cast iron steam radiation, it is meant that the boiler is capable of extracting from the fuel the number of heat units that would be thrown off a like amount of steam radiation in a still body of air at 70 per cent. Fahr.

One hundred square feet of direct cast iron steam radiation generally throws off as much heat as may be taken up by ten square feet of heating surfaces in the boiler. But the area of the heating surface alone can not always be taken as a safe guide in estimating the capacity of the boiler, as some forms of heating surface are much more effective than others. As a rule, 10 square feet of heating surface to a hundred feet of radiation is a fairly safe guide.

One of the things we should also take into account in estimating the capacity of boilers is their grate area. While different forms of heating surfaces require different proportions of grate surface, a safe rule to follow is to select a boiler that has a grate area equal to at least one square foot for every 160 feet of direct cast iron steam radiation, or its equivalent. This rule is based on the consumption of six pounds of anthracite coal per foot of grate per hour. In some of the larger sizes of boiler the rating is sometimes based on a consumption of eight pounds of coal per hour; and it can be said that with proper firing these boilers will develop steam to the full rate of capacities; but as most heating boilers are fired in a careless manner, it is not safe to figure for more than six pounds of coal per foot of grate.

Remember that boilers are rated to supply a certain amount of heat at their outlets and that a factor must be allowed for the loss of heat occasioned by the distance that the heat must travel from the boilers to the radiators. An allowance from 20 to 40 per cent. of the net radiation should be added to the actual load on the boiler to provide for this necessity.

Boilers used in hot water or steam heating systems may be of any of the following types:

1. The horizontal return tubular; a brick set boiler.

2. The fire box boiler either brick set or portable.

3. Sectional boilers in vertical or horizontal sections, these may be of cast iron or steel.

The horizontal tubular boiler may be used to advantage where soft coal and wood is the best available fuel. They are often preferred by engineers in hot blast systems of heating. The brick setting should be built only by capable mechanics and the setting should be examined at frequent intervals for the purpose of discovering and repairing air leaks that are likely to occur even in an almost perfect piece of work.

The fire box boiler is a horizontal tubular boiler with a water-jacketed fire box formed at the front end. It requires a lower cellar height than the return tubular boiler and can be used for almost any kind of fuel with the exception of the smaller grades of anthracite coal.

The greater number of boilers used for heating purposes is that of the sectional cast iron type. There are many varieties of these boilers on the market, differing principally in the direction of gas travel. An extended description of the different types of boilers would take up a great deal of space, and as manufacturers' catalogues as a rule contain complete description of particular types, we will do no more here than make notes of those things that should be looked for in a good type of boiler:

First—There should be few joints exposed to the direct action of the fire.

Second—All parts should be easily cleaned.

Third—The boilers should have few parts.

Fourth—The fire box should be large enough to permit of proper combustion.

Fifth—If the boiler is to have the attention of a constant fireman, or if it is to be self-feeding, the grate area should be large and thin fires should be maintained. In all other cases the fire pot should be deep, so that a large body of coal can be fed at one time.

Sixth.—They should contain sufficient water, so that in filling the radiators with steam the water line of the boiler will not be greatly lowered. While it is a fact that boilers with a small amount of water will get up steam quickly the boiler containing a larger amount of water will keep up steam longer.

Finally, we may say that before selecting the boiler we should be able to answer these questions:

What kind of fuel is the easiest to obtain?

Is the building in a residential district where soft coal smoke will be a nuisance?

What heating service is required, and is the building to be kept at the same temperature all the time, or is heat only required for only a few hours each day?

What kind of janitor service may we reasonahly expect?

How about room for the installation of the boiler?

There are many more questions that might be taken up before making a decision, but some of the things covered in the foregoing article should be at least the means of drawing the attention of the readers to what might be considered the most important details of the subject.

CATALOGUES AND BOOKLETS

Moline Heat, Moline, Illinois, has issued three most attractively printed data books, "Moline Heat Everywhere," "Moline Heat Everywhere, Supplement A," and "How to Plan and Specify the Univent." The first-mentioned book deals with high-class heating for high-class buildings of every size and character. A section is devoted to "The Evolution of Heating," covering hot air heat, ordinary steam heat, ordinary hot-water heat, and vacuum and vapor heat. In other sections the principles of Moline heat are discussed in detail, and many attractive illustrations are shown. The supplement A deals with the application of Moline heat to large buildings, groups of buildings and factories; live or exhaust steam, district heating, ventilating systems, dry kilns, etc. How to Plan and Specify the Univent is offered to architects and engineers as a ready reference and aid in preparing plans and specifications for the Univent for heating and ventilating systems.

The Standard Heating and Plumbing Co., Ltd., of Edmonton, Alta., have been awarded the plumbing and heating contract for the new tubercular hospital being erected at Keith, Alberta, by the Dominion and Alberta Governments.

News from Here and There

CONTRIBUTIONS OF NEWS GLADLY ACCEPTED

PERSONALS

John W. Bruce, of Toronto, general organizer for Canada, of the United Association of Journeymen Plumbers and Steamfitters of America, is in Winnipeg with the Industrial Commission, of which he is a member. This commission will visit various cities and investigate working conditions, and it is expected later will present a report to the Government.

Dan Bethune, of D. A. Bethune, Ltd., 483 Bleury Street, Montreal, was elected by the executive, as vice-president of the Montreal Master Plumbers, to fill the vacancy caused by the death of W. R. J. Hughes last winter. The appointment is doubtless a popular one, Mr. Bethune having returned recently from serving at the front.

MONTREAL PERSONALS

Martin Quigley is better. That will be good news to his friends, for Martin was suffering from a bad attack of neuritis. It was necessary to spend about three months in the hospital, and Mr. Quigley is still taking electric treatment in the hope that a complete recovery will be enjoyed. During his convalescence Martin went to New York. Some city, he says, and still he looks well. While in the Southern metropolis Martin could not keep his curious bump at rest. He saw electric radiators in use in some of the self-contained homes, and says they are fine. He remarked to SANITARY ENGINEER that he believed that, contrary to the general belief, a revolution in heating systems would come about within a comparatively few years, electricity being the medium.

Jos. Laurier is improving in health. His illness has been long and severe, and Mr. Laurier has many friends who will wish for him complete recovery.

There is a better spirit abroad in Montreal, and the plumbers are much more hopeful of the future. A considerable amount of new work is looming in sight, and general jobbing is more active. The plumber and the heating engineer are going to have their innings, and they are entitled to it for they have waited patiently for several years for the really good pickings.

At the annual meeting of the Canadian branch of the Royal Curling Club, held on April 26, suitable allusions were made by its members to the removal by death of the late W. J. R. Hughes, of the Caledonian Curling Club, and who died suddenly during the progress of a game last winter.

Charette and Frere, 416 Ontario Street East, Montreal, have made an improvement in their store by having their office enclosed. There is a glass front and sides and two entrance doors are provided.

Jim Griffin, chairman of the entertainment committee for the June convention, was away for a brief time last week, and it is stated that he will have some good fish stories on tap for the delegates. SANITARY ENGINEER has not been able to locate the "fishing grounds," but there may yet be a real fishing trip in prospect. Several of the Montreal stalwarts accompanied "Jim" on this eventful journey up-country.

TRADE NOTES

Marchessault Bros., of St. John's, P.Q., have purchased 134-136 Richelieu Street, and intend to establish a plumbing and tinsmithing business there as well as carrying motor specialties and selling gasoline.

Cotter Bros., of Winnipeg, have secured the contract for the plumbing and heating in the new power house, Tuxedo Military Hospital.

The sanitary conditions in St. Catharines came up for discussion before the Board of Health of that city this month. Dr. D. V. Curry, the Medical Officer of Health, made his report to the board, which showed conditions, especially in the Facer Street and Pelham Road districts, to be very bad.

Montreal is converting three of the boilers at her waterworks pumping station into oil-burning boilers as an experiment. The work is being done by the Imperial Oil Co., and if the experiment proves satisfactory the city will reimburse the company for this work. The Imperial Oil is supplying the necessary oil. There are fifteen boilers at the pumping station, twelve of which are continually in operation.

CHARLES E. WATSON WAS A LUCKY MAN

John Watson, head of the firm of John Watson & Co., sanitary and heating engineers, Montreal, wore a big smile last week, for it brought the climax of a long separation from his son, Bombardier Charles E. Watson, who has been "doin' his bit" over there since 1916.

As a corporal, Mr. Watson Jr. enlisted. Connecting himself with the McGill or Seventh Siege Battery, he went overseas, and has been there continuously ever since, getting back to "blighty" for a brief time, but following the job of soldiering with the same earnestness of purpose as he used to "throw the lead."

Surely this man was born under a lucky star. He was in the first big fight at Vimy Ridge, and was not even wounded. Men were blown to nowhere at his side. Steadily he continued to serve the great cause and to dodge the bullets. He has returned, none the worse for his experience, and will join his father in his old business at Montreal, and to which he will doubtless be glad to again attach himself.

PLUMBERS' ASSISTANCE SOUGHT

The Administrative Commission of the city of Montreal has invited the Master Plumbers to aid in drafting the new city building by-laws. In accordance with this request a committee of three, consisting of Messrs. Ogilvie, Ryan and Charrette, were named to aid in drafting the new laws, to be in operation by January 1, 1920.

SECURING APPRENTICES

There are labor disputes and troubles enough as we all know. Still, there is no reason why the plumber should fail to look upon the future with confidence, and in high hopes of advancement being made.

In speaking the other day with a senior officer of the Canadian Society of Domestic Sanitary and Heating Engineers, he believed that plumbers everywhere should take a real interest in securing the best possible material as apprentices. The trade was a good one to learn, he said, and if the better class of young men were interested in the prospects, he thought better men could be induced to work in the shop.

The problem is a big one, and solution of it can only be made by careful, thoughtful, attention. It would doubtless be wiser to pay a worthy apprentice a salary that would be some inducement. A heart-to-heart talk with the young men you wish to interest might yield good results.

TORONTO SCHOOL BOARD BUILDING SUPT. RESIGNS

E. H. Bishop, Superintendent of Buildings of the Toronto Board of Education, has tendered his resignation after over thirty years of service, due to the determination of some members of the board that no work shall be carried on under

his supervision. This has caused an impossible situation and Mr. Bishop's resignation is the result. A. D. Waste, assistant superintendent; Wilbur Webb, head draughtsman, and Geo. Bachman, architect, also resigned in sympathy with their chief.

Supt. Bishop has signified his willingness to assist in the investigation now being carried on under Justice Lennox, and to complete such work as is at present in hand, otherwise he wishes to be relieved at once.

This takes practically all the heads of the department and can only result in a complete reorganization.

The property committee of the board itself has no plan as yet for the reconstruction of the department, but Frederick Hambly, chairman of the property committee, is in favor of having a practical business man at the head of the department with a practical builder under him.

ALBERTA PLUMBERS MAKE FORWARD PLANS

Continued from page 17

to take into consideration the past lean years for plumbers. If the men should feel that the expense, and the time, now that business is reviving, and needs all their time at home, they will have to be excused, if they cannot see their way clear to leave home just at this time. They know that every dollar and every hour must count and be used to the best and most immediate needs. They may also have the feeling, as the writer has, that the Eastern man will see to it that the Western men take no hurt by anything that the members assembled may do, as the best interests of the trade are mutual. Possibly, by another year, things may be different, and it may then be possible for the East and West to get together and compare notes."

"The best interests of our trade lose nothing by these annual gatherings. It is in the somparing of notes that we can arrive at what is best in the ever-changing conditions of our surroundings. I trust that the coming convention will lose nothing of its usefulness. My only regret is that I will not be able to take advantage of it, by my personal attendance. but I would advocate the attendance of all those who are able to attend.

"It gives me pleasure indeed, to extend to you my word of praise, Mr. Editor, for the very special efforts that you are constantly placing before the readers of your trade journal. the SANITARY ENGINEER, and my best wishes for its continued success."

(Sgd.) JAMES MARR.

THE IMPORTANCE OF THE CASH DISCOUNT

Continued from page 27

our country, one of the prime assets of American citizenship—the chance to prosper and progress to whatever extent each man has in him the requisite capacity, energy and business ability to take advantage of the opportunities which abound in this great republic.

There is another abuse of the "cash discount" which the business men of this country have lately been urged to adopt and which is so full of fallacies that it would take a large volume to cover them all in detail.

The idea is that we should allow the "cash discount" to a man who sends us a trade acceptance. That is simply giving the quid without getting the quo—giving the "cash discount" without getting the cash—giving the value of eliminating the credit risk, and then having it extended instead of eliminated—allowing each customer to borrow money on our credit by endorsing his paper, and then paying him for the privilege of doing so.

For instance, those of us who are doing business on terms of 60 days with 2 per cent. for cash in 10 days are urged to offer to our customers the privilege of sending us a 90 day trade acceptance within 10 days and deducting the 2 per cent. "cash discount." Let us see how that would work out as compared to the present arrangement.

Roughly speaking, about half of our customers discount their bills—it is probably more than half in dollars and cents, therefore we get half of our money within 10 days. We get cash and the transaction, together with the credit risk, is terminated. On the other half, the large majority pay their bills at the end of 60 days. Some few run over a little bit, but the average of the whole, including the half which pays in 10 days, results in about a 45-day credit period with an allowance of 2 per cent. on one-half of the total of 1 per cent. of the whole amount.

The plan we are urged to adopt instead of that, is to allow 2 per cent. to everybody, but to charge them 1½ per cent. interest for 90 days which interest we in turn would pay to the bank. Therefore, we would be out 2 per cent. discount on the whole business instead of 1 per cent.

Then, in order to transfer this loan to the bank we must endorse each customer's note for the full amount of his purchases and wait for an average of 90 days instead of 45 for the closing of the account and our liability and the elimination of the credit risk.

The "cash discount" system provides an adequate means of governing two important factors in domestic trade, one that of enabling the new merchant to take advantage of opportunities, to grow by availing himself of the credit accommodations offered by those firms whose representatives visit him regularly and are personally acquainted with his business, his methods and his likelihood of success.

It also provides amply and correspondingly for the man who does not need credit accommodations, but who can, so to speak, carry his own credit risk.

Against Acceptances

Mr. Simmons argues that the use of the trade acceptance would practically mean the abandonment of the cash discount and says: "If we should allow ourselves to be led to abandon the American systems by substituting acceptances for cash discounts, it would, of course, mean the substitution of the payment by notes for payment by cheques, and if the scheme is worked out according to the evident design, it would mean that for every one of our invoices we would have a note which we would have to pass to our banks for collection, and on each one of which there would be a collection charge. To sum it all up in a nutshell, our American system has proven itself to be a good system—and we would be very foolish to allow anyone to lead us to abandon it.

CEMENT IN PLACE OF LEAD

A report states that the Bureau of Water Works of Portland, Ore., has been using cement in place of lead for the joints of its cast-iron water mains. According to the engineer of the bureau, one pound of cement at half a cent per pound will satisfactorily take the place of three pounds of lead at eight cents per pound, so that there is a material saving in cost. The labor of making the joints, however, reduces this saving, because the cement joints have to be kept wet for from 36 to 48 hours. The joint is first packed with yarn and oakum, and then neat cement is forced in.

"Payment of Freight" Plans Worked Out

The plan of the Canadian railways to go on a cash basis will become effective on June 1. As stated in previous issues of SANITARY ENGINEER, the railways planned to do this on March 1, but the manufacturers and many of the large firms made such strenuous objections to the clause in reference to bonding, that it was postponed. As a result of conferences between members of the Canadian Railway War Board, the railways and the shippers, an understanding has been arrived at by which the objectionable bonding clause has been eliminated. This, it is stated to HARDWARE AND METAL, would have made the whole plan unworkable.

The suggested arrangements are practically an adoption of the plan that has been in use by the Canadian Pacific Railway, and, it is stated, are entirely satisfactory to shippers throughout the country.

Payment within 48 hours, it is stated, will be considered as cash.

Charges on goods shipped from the 1st to the 7th of any month, inclusive, shall be paid on or before the 14th of the same month; charges on goods shipped between the 8th and 14th of any month, inclusive, shall be paid before the last day of that month, and charges on goods shipped between the 22nd and the last day of any month shall be duly paid before the 7th day of the month following.

Market Conditions and Tendencies

Statements Regarding Supplies and Trend of Prices

THE MARKETS AT A GLANCE

INGOT metals provide the most interest in the markets this week. Tin, after remaining quiet for some little time, has responded to a buying movement in the United States markets, with the result that prices moved up from 2c to 4c per pound this week. Lead, after showing decided weakness, has firmed up and a reaction to higher levels is expected. Copper is very strong and the positive attitude of the spelter market would quickly reflect a buying movement in advanced prices.

The position of tin and lead has resulted in an advance in the price of solder amounting to 2c per pound all the way around. Manufactured lead products are held without change, and a somewhat improved demand is noticeable.

Enamelware maintains a firm position and in spite of the feeling among some factors that a revision downward be made, the market maintains a level from which there are no signs of an immediate change.

Buyers returning from the mill districts in the United States within the past few days, come back with the conviction that prices are about as low as they can get on sheets. One factor mentions having gone into actual production figures with one large mill and the revelations were such that he has come back convinced that the market to-day is right in line with costs. Apart from the element of competition there doesn't seem to be any possibility of a revision downward in sheets for some time to come.

TORONTO, May 15.—About the only cloud on the horizon as far as the trade in general is concerned appears to be the labor situation. If strikes develop there is no telling what the consequences will be. A good volume of business is now being handled and numerous inquiries from all parts of the country indicate that a lot of new business is likely to develop. The markets seem to have settled down fairly well and price changes are few. A change which is expected in some quarters, but which so far has failed to materialize, may come in slightly lower prices for enamel goods. Slightly lower prices are now in effect for standard brass steam cocks.

Solder has moved up 2c per pound as a result of higher levels being reached on tin and the stronger tone evident in lead.

Range Boiler Prices Remain Unchanged

RANGE BOILERS.—A fair volume of business is being done and prospects are bright for a good season. Prices show no change, and none are expected in the immediate future. The quotations are as follows:

Range Boilers	Standard	Extra Heavy
30-gallon	$12 25	$14 50
35-gallon	15 00	17 00
40-gallon	18 00	20 00
52-gallon	24 00	28 00
66-gallon	33 00	38 00
82-gallon	40 00	47 00
100-gallon	50 00	58 00

Enamel Firm Despite Predictions

ENAMELWARE.—The view that has been held in some quarters that lower prices are coming for enamelware is still held in spite of the fact that the downward revision has not materialized. Business in these lines is showing some improvement, but is not at all heavy. Quotations show no change, and are as follows:

Bath-tubs, roll rim, 4, 4½, 5 feet, 24 to 30 in. wide	$32 10
Bath-tubs, 5½ ft.	35 70
Basins, flat back, 14 x 15 in.	6 45
Do., corner, 15 in.	7 15

Closets, oak tank and seat	25 50
Do., enamel iron or white vitro tank	27 50

Steadiness Marks Wrought Pipe

WROUGHT PIPE, BOILER TUBES.—The market on wrought pipe is holding quite steadily. More activity is noted, orders coming through in fairly good quantities and prices shown in quotations herewith are being maintained.

Freight equalized on Chatham, Guelph, Hamilton, London, Montreal, Toronto, Welland.

No Changes in Soil Pipe or Fittings

SOIL PIPE, FITTINGS.—The fact that many of the molders are on strike has not affected the markets nor trade so far, as fair stocks are on hand and all demands are being met. Business has not been heavy, but shows some improvement, and if conditions become more settled, prospects, it is stated, are for a good season. The quotations are:

Medium and extra heavy soil pipe, 2, 3 5 and 6 in.	20%
Medium and extra heavy soil pipe, 4 in.	25%
Medium and extra heavy soil pipe, 2 in. to 6 in.	35%

Brass Steam Cocks Reduced Slightly

VALVES—.No changes have been made in quotations on steam goods with the exception of brass steam cocks, standard, which are now quoted at net list. Trade in many lines has been a little quiet, although there are numerous inquiries. A good business in ma-

MUELLER

Water, Gas and Brass Plumbing Goods

CANADA'S BEST

We wish to direct your attention to the fact that there is nothing in water, plumbing or gas brass goods practice that we do not manufacture. The test of over 60 years of producing nothing but the very best in these lines conclusively proves that we are the masters of such manufacture.

We are illustrating a few of our various lines and wish to direct your attention to the fact that—

Our 1919 Catalog A is ready for distribution.

WE MAKE:

1—Tapping Machines
2—Corporation Cocks
3—Goose Neck Connections
4—Ground Key Curb Cocks
5—Rapidac Bath Cocks
6—Rapidac Basin Cocks
7—Globe Valves
8—Drilling Machines
9—Regulating Valves
10—Meter Testers
11—Bath Supplies
12—Service Boxes
13—Basin Combinations and many other articles of highest quality.

H. Mueller Mfg, Co., Limited

SARNIA, ONT. CANADA

rine lines is being handled. The quotations are as follows:

Compression work, standard	50
High grade	49
Fuller work, standard	45

Globe, angle and check valves, standard, medium pressure	23%
Radiator valves ,standard med. pressure	31%
Radiator valves, removable seat, medium pressure	25

Boiler Tubes Remain Firm

BOILER TUBES.—The market remains firm, and from reports gathered, no immediate change is expected. The outlook for business seems fair and an open market on steel, now generally expected, will, it is thought, improve the situation as a whole. Quotations are now as follows:

BOILER TUBES—	Per 100 feet Seamless	Lapweld
1¼ inch	$27 00	$.....
1½ inch	28 00	.....
1¾ inch	30 00	26 00
2 inch	30 00	26 00
2¼ inch	33 00	28 00
2½ inch	40 00	32 00
3 inch	46 00	38 00
3¼ inch	.....	45 00
3½ inch	56 00	42 00
4 inch	70 00	54 00

Waste Holds; Oakum Unchanged

WASTE, OAKUM. — There is little new to report in the situation on waste. Sales are not large, but the outlook is not considered discouraging by any means. Prices remain at unchanged levels.

The situation in oakum is on a parallel with that of waste. A fair amount of business is being handled at firm and unchanged prices.

	Per 100 lbs.	
Best American	$21 00	$22 00
Clipper, spun	.....	21 00
Do., unspun	.....	10 50
Plumbers' spun	.....	9 50

Sheet Basis Seems Near Bottom

SHEETS, PLATES.—One large factor, in talking to SANITARY ENGINEER this week on the situation in sheets, said: "I have just returned from Pittsburgh, where I was in touch with two very large mills in respect to sheets. These mills took me over their cost sheets and the figures I saw have convinced me that the market is about as low as it will go. I have been a consistent bear on the market for some months past and it has taken this actual insight into production figures to bring me to a feeling that present figures were not too high. I feel now that little, if any, further decline can be made. Most certainly the buyer is not risking much in covering for his requirements for some little time ahead." An open market might create a temporary flurry and bring about lower prices, but the feeling is that no substantial drop, considering costs, can be or will be made effective. Quotations for the week reveal no change. Sales are reported brisk.

BLACK SHEETS—	Per 100 lbs.	
10 gauge	$5 00	$5 45
12 gauge	5 05	5 50
14 gauge	....	5 10
16 gauge	....	5 20
18-20 gauge	....	5 80
22-24 gauge	....	5 85
26 gauge	....	5 90
28 gauge	....	6 00
3-16 inch plate	4 90	6 25
¼-inch boiler plate	4 50	5 80

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

GALVANIZED SHEETS—		
10¾ oz.	$7 80	$8 10
U.S. 28	7 40	7 70
U.S. 26	7 10	7 40
22 and 24	6 95	7 25
18 and 20	6 80	7 10
16	6 65	6 95
12 and 14	6 50	6 80

An extra is now charged on galvanized sheets, 10¾ oz. and 28 ga., when shipped out in sheets 3 feet wide. The extra charged over prices shown above is 20c per 100 pounds. Other gauges show no change for different widths.

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

Reaction in Solder; Higher Prices Named

LEAD AND ZINC PRODUCTS.—Prices on solder reacted this week, going up 2c per lb. as a reflection of the stronger feeling in lead and advances made in quotations on tin. Figures now being quoted on solder range as follows: Guaranteed, 35c to 39c; strictly, 33c to 35c; commercial, 30c to 33c; wiping, 29½c to 32c; wire, 36c to 42c.

No change has been made in manufactured lead products, but a better tone to the market is apparent as a result of the improvement in the metal. Business is reported to be good. Range of prices follows:

Lead pipe, lb.	$0 11½
Lead waste pipe, lb.	0 12½
Lead traps and bends	15%
Lead wool, lb.	0 14
Lead sheets, 4 to 6 lbs., sq. ft., in rolls, lb.	0 10¼ 0 12
Cut sheets ½ to ¾c lb. extra and cut sheets to size, 1c lb. extra.	
Solder, guaranteed, lb.	$0 35 $0 39
Solder, strictly, lb.	0 33 0 35
Solder, commercial, lb.	0 30 0 33
Solder, wiping, lb.	0 29½ 0 32
Solder, wire, lb.	0 36 0 42
Zinc sheets, per lb.	0 17

Still "Nothing Doing" Sign in Evidence

OLD MATERIALS. — Scrap yards have had a poor season of it. In fact, since the signing of the armistice there has been nothing worth while in the business, and some of the dealers with large overhead expenses have probably lost money. Range of quotations which can be termed only nominal, follow:

Dealers' Buying Prices—		
Tea lead	....	0 03
Heavy lead pipe	....	0 04
Pipe scrap	....	8 00
Stove plate, per ton	....	10 00
No. 2 busheling	....	8 00
Yellow brass	....	0 06
Red brass	....	0 08½
Light brass	....	0 05
Scrap zinc	....	0 05
Heavy copper	....	0 15
Wrought iron, No. 1, per gr. ton	....	15 00
No. 1 machinery cast	....	14 00
Heavy melting steel	....	9 00

Tin Goes Higher; Lead Stiffens

INGOT METALS. — Tin moved up from 2c to 4c per lb. this week, and seems to be on the upward trend again. Lead, after a period of dullness and weakness, has stiffened, and it looks as though a revision in prices upward may result.

COPPER.—The market at primary points is firmly held, and there seems to be some interest in the metal. Locally, the price has held unchanged at 18c per lb., but the undertone is strong.

TIN.—This metal has reacted as a result of some buying which has developed in U. S. markets after a period of little activity. It looks as though even higher levels may be reached than the 58c to 60c per lb. price now asked.

SPELTER.—There is a better feeling, and it is felt that any buying would result in a stiffening of values, the metal being quite sensitive to any such factor. Price holds at 8¼c per lb. locally.

LEAD.—A reversal of feeling is noted in lead, the undertone to the market strengthening appreciably, though no quotable change has occurred locally, 6½c per lb. being figured ruling.

ANTIMONY. — There is only a fair amount of business being done, but the market is quite firm. The price here to-day is 8½c per lb.

ALUMINUM. — Still uninteresting and little activity reported. A price of about 40c per lb. fits the situation as it exists to-day.

STRATFORD JOURNEYMEN DEMAND INCREASE

Stratford, Ontario, Journeymen Plumbers held a meeting on Sunday, April 27 to discuss the new schedule of prices which they are presenting to the Master Plumbers. The following statement is given out for circulation:

"The rate of pay is at the present time 35c to 50c per hour. The working day is calculated on a basis of ten hours. If the Master Plumbers have decided to change to a nine-hour day the journeyman have not been notified to that effect.

"It has not been the policy to pay time and one-half or double time for overtime work.

"We are asking for 65c per hour for a basic working day of eight hours instead of a 50c to 75c increase as the Master Plumbers have stated."

The demands also include time and one-half for overtime and double time for Sundays and holidays.

WE manufacture a full line of Steam, Vacuum and Combination Gauges, Locomotive and Duplex Gauges.

MORRISON'S Standard Test Gauges, Hydraulic, Altitude and Sprinkler Alarm Gauges, Combination Water Works Gauges.

PYROMETER Gauges, Engineers' Clocks and Revolution Counters, Pressure Gauge Testers, Pyrometers for Bakers' Ovens.

RECORDING Pressure and Temperature Gauges, Blast Pressure Gauges. Dealers in Thermometers for Heating Installations, Feed Water, Flue Gas, etc.

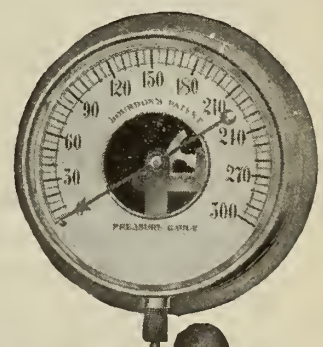
UNITED BRASSFOUNDERS AND ENGINEERS, LIMITED

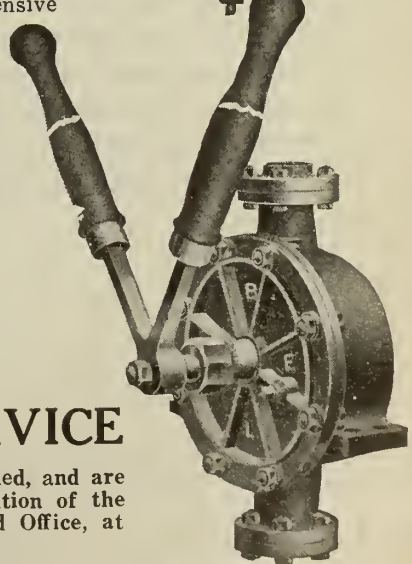
EMPRESS FOUNDRY, CORNBROOK, MANCHESTER, ENG.

DURING THE WAR our Plants have been exclusively engaged on work of supreme national importance.

WITH PEACE IN SIGHT we are pleased to announce that we intend to again direct our energies to the intensive production of:—

GUNMETAL and BRASS VALVES and COCKS.
STEAM, WATER and COMPRESSED AIR FITTINGS GENERALLY.
CAST IRON STOP and SLUICE VALVES.
SEMI-ROTARY PUMPS.
EXTRUDED BRASS and BRONZE BARS.
BRASS BOLTS and NUTS, STUDS and GENERAL TURNED WORK FROM THE BAR.
CAST AND MALLEABLE IRON COCKS and PIPE FITTINGS.
PRESSURE and VACUUM GAUGES.
INJECTORS and GENERAL JET APPLIANCES.
ENGINE GOVERNORS (Pickering, Proell, and Other Types).
SPRAYING MACHINES, for Insecticides and Lime-washing.
COPPERSMITHS' WORK.
"STELLA" BRAND ALLOYS: MANGANESE COPPER, SILICON COPPER, FERRO ZINC, PHOSPHOR COPPER and TIN, etc.

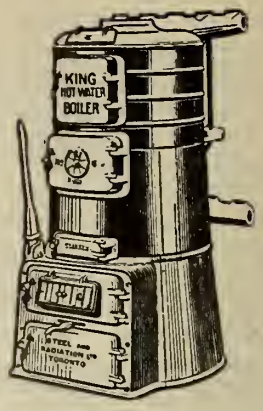




"UBEL" POST-WAR SERVICE

If you are interested in any or all of the lines mentioned, and are in a position to take a hand in the energetic distribution of the same, please communicate with us NOW to our Head Office, at above address.

Recommend to Your Customers Common Sense Heating



A Hot Water Boiler of the correct capacity, with the proper radiation is the most efficient method of heating. It is only by installing the system that will give your customer entire satisfaction that you can hope to get more orders.

KING HOT WATER BOILERS AND IMPERIAL RADIATORS

Give that satisfaction in the highest degree. You can safely stake your reputation on King Hot Water Boilers and Imperial Radiators. Besides the King Boiler is very economical to operate, due to the quick-heating principle of the water-ways.

We require a few live Agents. Write us if you will represent us.

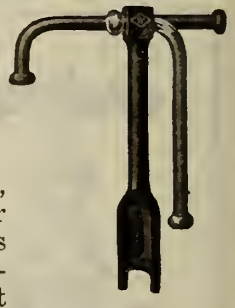
ADVERTISING to be successful does not necessarily have to produce a basketful of inquiries every day.

The best advertising is the kind that leaves an indelible, ineffaceable impression of the goods advertised on the minds of the greatest possible number of probable buyers, present and future.

Williams' Falcon Drop-Forged Waste Plug Spanner



THE old adage tells us, "Necessity is the mother of Invention," but makes no mention of the father; presumably he is "mere man." At any rate, we are rather proud to have "fathered" the invention of the useful and badly needed tool here illustrated.

It is far more efficient than any possible makeshift, and its folding handle allows it to be readily carried in the pocket. The dimensions of the "finger ends" make it universally adaptable to all sizes and forms of basin and sink plugs and grates. The tool is hardened for severe service. Descriptive Booklet on request.

X Laboratories 43

There's Something about an Original that Can Never be Imitated!

IF you've ever heard Harry Lauder sing his Scotch songs you could tell an imitation with your eyes shut.

You've seen Charlie Chaplin do his stunts—do you think an imitator could fool the people?

Whether it's real diamonds or paste—whether it's pure gold or brass—an imitation is simply an imitation—**and nothing else.**

That's why the thoughtful steamfitter isn't going to fall for anybody's talk about something "just as good" as "X" Boiler Liquid. He knows that for positive results it is safer to stick to the original. An imitation of the genuine "X" may look like it—but that's all. Patents are allowed on the "X" Liquid process. Its quality **can't** be imitated. Imitations of the genuine "X" Liquid cause foaming. **"X" will prevent foaming.**

No fitter can afford to experiment with his profits. When you get a leaky or cracked boiler job you want to know that you can send any man to that job—have him finish it quickly—otherwise there's the kicking, the arguing and the time-wasting that is utterly useless from a money-making standpoint.

Over 25,000 steamfitters now know that "X" Liquid is the **only** scientific process for repairing leaky and cracked boilers—and for making them LEAKPROOF—RUST-PROOF — AND SCALEPROOF. They know that with "X" they make three times the profit that they could by dismantling and welding.

And they wouldn't risk their reputations experimenting with an imitation.

The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH

Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with wood handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

Nut with Nut-Guards

Inquiries from Importers and Dealers Solicited. Send for Catalogue No. 55.

This is a "Q" Foot Valve

And it Just *CAN'T* Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

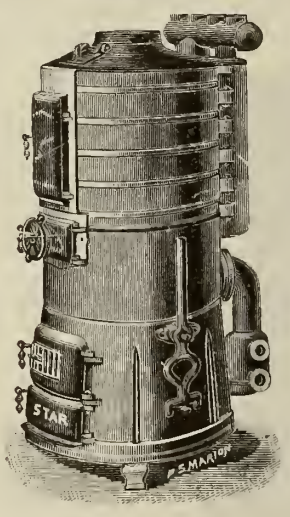
Thousands of Star Boilers in Use requiring repair Parts



It will be a long time before folks forget the coal troubles of the last few seasons.

The principal feature of the Star Boiler is that **no other round hot water boiler has any coal-saving improvement not embodied in the "Star."**

Then, too, while boiler installation and repair time is here, why not stock up with Star parts, for which O. Belanger has taken over the rights and is now making?

Many thousands of Star Boilers are in use requiring these repair parts hitherto unobtainable.

Write to us at once in time to catch the season's business.

We guarantee prompt deliveries.

Have You Taken Down Your Sign?

A prominent merchant who has made a great success of all branches of his business has said that withdrawing advertising from a good trade paper is like taking down your sign. Advertising to the trade you serve is business insurance, but premiums must be kept up or the policy will lapse.

There never was a time when the trade was keener for business information. That is why the advertising pages of the SANITARY ENGINEER are being followed so closely at the present time.

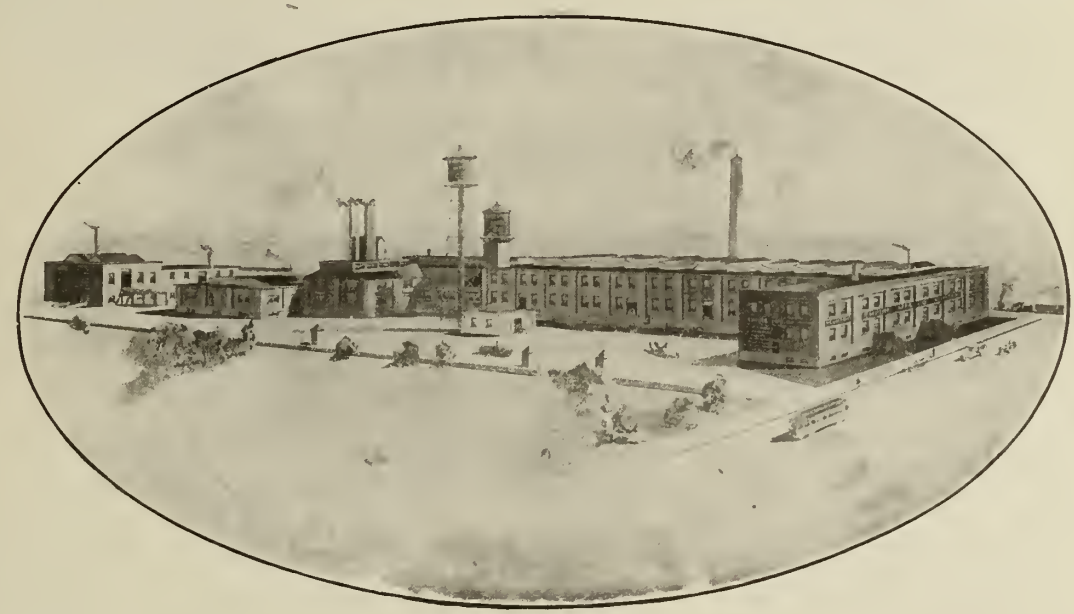
VOL XIII. PUBLICATION OFFICE, TORONTO, JUNE 1, 1919 No. 11.

Empire Service



A NEW season is opening up—after upwards of four years of more or less retrenchment in general building and construction work, the Canadian Building Trades will this Spring commence catching up on work that has been left undone—work laid aside for more pressing war duties.

This will impose many new problems on the plumbing, sanitary and heating interests, but here is where we offer our services—BESIDES SUPPLYING COMPLETE LINES OF PLUMBING, SANITARY AND HEATING EQUIPMENT, we send our engineers to assist you solve any complex problems that may confront you.

Your problems are our problems, too. It may be the equipment of a new building with the very latest types of plumbing and sanitary facilities. We can help you plan this work. It may be that a building must be refitted—a water pressure system may be needed, or heating facilities found necessary. We offer you expert advice, and can supply EVERY NEED.

Write us for our special Catalogue. Specify your needs. We can be of infinite service to heating and sanitary engineers. We also guarantee prompt delivery.

"Dual" Mixer

A valve that really mixes Hot and Cold Water, and maintains a uniform mixture.

For ease of operation, simple construction and easy installation, it has set a new standard of efficiency.

Cold Water must be turned on first, no possibility of scalding.

Made in several forms for Showers, Sprays, Operating Rooms, etc.

At the well-known works of Messrs. Brunner, Mond & Co. these valves provide baths for 2,500 employees.

Grate burn outs— A preventative

IT'S just plain human nature for a man to get so stirred up over a grate, that he has to lug and tug on to shake, that he unconsciously, or otherwise, leaves the pit choked full of ashes, and if the drafts are left open long enough, the grate burns out.

So that's one of the reasons why we make Burnham Boiler grates shake half at a time, because then they shake half again easier.

Another thing in favor of half the grate shaking at a time — you can run half the fire at a time.

Clinker doors are mostly cramped narrow slits. The Burnham has a wide-mouthed one—big enough to do what it's meant to do.

A Timely Service and the Company Behind It

The public wants better steam-heating service—more comfort per ton of coal. This Company is in a most favorable position to meet this demand through its co-workers—the architects, heating and ventilating engineers, heating contractors and builders—to whom it offers practical co-operation that will increase their prestige as well as their volume of business.

Any man who uses, specifies or installs steam-heating equipment will find it advantageous to learn more about Dunham Heating Service—the product of 15 years' knowledge of steam-heating in all its phases.

PIPE THREADING TOOLS

Take Another Look At This Job

ESTABLISH PEACE

If you desire to establish lasting peace in your shop, you will have to furnish your men with good tools. Men will not do the same amount of work if that work is hard. The more you *INVEST* in tools if they're good tools, the less you will SPEND in labor. To invest is to establish an asset, to spend is to create a liability. Our tools will save you money and make peace in your shop.

ESTABLISH PROFIT

Work made easy becomes a pleasure. Jardine and Toledo Pipe Threading Tools make threading pipe so easy that a boy can thread a 4-inch pipe as easily as he can thread a ½-inch pipe.

Not only so but when a thread is made with one of our tools it's a good thread. No cutting off pieces of pipe. No lost time and no leaks. That's the way to establish a profit on every job.

Williams' "Vulcan" Chain Pipe Vise

THIS Vise is, perhaps, one of the most remarkable of our products. It is the result of many years of careful study and comparison of many pipe vises—their advantages and weaknesses.

Williams' "Vulcan" Chain Pipe Vise in the *only* pipe vise made wholly of wrought steel and is stronger, lighter and more compact than the old style, conventional cast tool it is rapidly superseding. It embodies all the desirable qualities of a really superior pipe vise for it is unbreakable and combines positive grip, powerful action and rapid adjustment with ease of attachment anywhere.

Three sizes—1/8 to 8-inch pipe. Descriptive booklet on request.

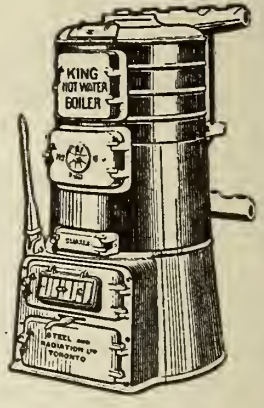
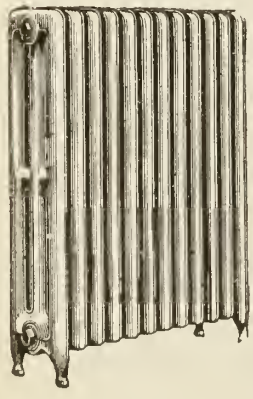
Houses, Factories and Schools

Heating is a most important problem. The "thin waterway" idea, used in King Boilers and Imperial Radiators, insures quick circulation, which causes greater fuel efficiency and less fuel consumption. At the present prices of coal, fuel saving is a most important question. This argument alone is good enough for you to sell your customers a King Boiler in preference to any other make.





KING HOT WATER BOILERS AND IMPERIAL RADIATORS

King Boilers and Imperial Radiators are constructed with great accuracy and carefulness. This insures against dissatisfaction after installation. The new design of the Imperial Radiator is pronounced by architects and persons of discernment to be the most pleasing and artistic and the best seller of any Radiator yet devised.

This is a "Q" Foot Valve

And it Just *CAN'T* Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

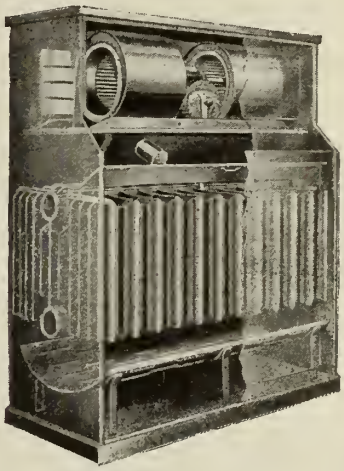
"LIVE OUTDOORS-INDOORS"

—A Fine Booster For Your Business—



A light, easy job appeals to most men, especially if the pay is better than ordinary.

In the same sense, a light, easy installation of a Heating and Ventilating System appeals to the heating contractor—especially if there is better profit for him.

The UNIVENT installation can be made with fewer men, in less time, with less actual labor than with any other system—and the ultimate profits are greater—and your client is completely satisfied.

It is good, sound business for you to obtain a good working knowledge of the UNIVENT—the most efficient ventilating system in America to-day.

This system is successfully operating right now in hundreds of buildings of all kinds.

Some valuable territory still open for good sales representatives.

Why Did We Let Trotzky Go?

THERE was a time when Canada had it in her power to end the war. In the early days of the Russian Revolution a bushy-haired German was taken off a boat at Halifax and interned at Amherst, N.S. He pretended to be a Russian but was known to be in German pay—on his way to push the revolution—British and American Intelligence Officers so informed our authorities. But pressure was brought to bear and the man was finally released. He got to Europe and became the most sinister figure among the Bolsheviki. Largely as a result of his work, Russia dropped out of the war and Germany was able to fight on for eighteen months. That man was Leon Trotzky. His real name was Braunstein.

Why was Trotzky allowed to leave Canada?

Colonel MacLean discusses this question in the June issue of MACLEAN'S MAGAZINE. He tells the story of Trotzky's activities, of his arrest and subsequent release in full detail, tracing the threads of a strange intrigue from Germany to Washington, and Washington to Ottawa. It is a gripping story, the most important inside story of the war.

BUILDING PERMITS

April—1918	$ 3,065,873.00	
April—1919	5,639,997.00	
GAIN		$2,574,124.00
4 Months—1918	$ 7,717,999.00	
4 Months—1919	11,522,767.00	
GAIN		$3,804,768.00

The above figures are an answer to those who say, notwithstanding the insistent demand for more houses, that building will not go on until conditions change. The fact is, builders are building and will build, and are finding that the investment is profitable at to-day's prices.

Some people say prices are high. Of course they are high in comparison with pre-war prices, but everything else is high. The price of building is not as high as other commodities. Read the following comparison taken from the "Iron Trade Review" comparing Iron with Wool, Beef and Cotton Products, using Chicago quotations:—

> "Wool, Pork and Beef sell to-day for three times as much as in 1913. Cotton for little more than twice, while iron has only increased one and a half times."

All other building material, including Lumber and Plumbing Goods, are comparatively low as is Iron. Just figure it out for yourself, make a comparison of prices and when you are satisfied, tell your customer and do your share with everyone who is interested in building material, whether as a Manufacturer, Jobber or Contractor, to make more and a bigger and better building business.

Canada wants more homes, and more homes mean more building, more work for the Contractor, more business for the Jobber and keeps the Manufacturer's plant in operation.

Our Company is in the Enamelware business. We are interested in the building business in general, but we make Plumbers' fine Enamelware in particular. It can be bought from every Jobber in Canada and "PORT HOPE" Sanitary Ware is installed in nearly every comfortable home. Plumbers like it because it makes satisfied customers.

Names Three Essentials of Success

"Get a Good Stock of Good Goods, Get a Good Location for Your Store and Don't Be Afraid to Advertise"—Views of London, Ont., Dealer Expressed—Goes After Trade Aggressively—Displays a Feature

Based on an interview by C. E. Parsons, of Sanitary Engineer, with F. C. Hunt, of the Hunt Plumbing Co., London, Ont.

"GET a good stock of good goods, get a good location for your store and don't be afraid to advertise."

That is the plan on which F. C. Hunt, of London, Ont., works, and which he says has resulted in his business making a steady growth. There are not many plumbing shops in Canada which have as nice a display window as that in the store of the Hunt Plumbing Co. It has a frontage of forty feet on one of the main streets of London and Mr. Hunt never for one moment neglects to make the most of his opportunity for showing his stock in it. The window display is changed regularly and special care is given to keeping not only the window but everything that is put into it looking its best.

Brings People In

"There is certainly no doubt about the results we get from our window displays," said Mr. Hunt to SANITARY ENGINEER. "They are a big help in selling goods. Any number of people come into the store and ask about the things we show in the windows. They not only ask about them but they buy. Our display windows are certainly one of the most valuable sections of the whole store."

The shop of the Hunt Plumbing Co. is located on a corner. This gives it two windows, the large forty foot window mentioned and a smaller one facing on a side street. The smaller window is used to good advantage also and the displays in it are also changed regularly. It is, however, on the big window that the main efforts are centred.

Store Display Also

Mr. Hunt makes his store arrangement back up in every way the interest that may be aroused in prospective buyers by the window display. The whole front section of the store, forty feet in width, behind the main show window, and extending back for about twenty feet, is used for displaying electrical fixtures, bathroom equipment and plumbing goods generally. The accom-

THE HUNT PLUMBING CO.
HOT WATER HEATING
PLUMBING & GAS FITTING
THE HUNT PLUMBING CO.
THE HUNT PLUMBING CO.
HOT WATER HEATING ELECTRIC FIXTURES

It is not every plumber who has the possibilities for such an extensive window display as the Hunt Plumbing Co., London, Ont., whose store front appears above. However, nearly every plumber has a display window which can be used to advantage and this means of attracting the interest of the passer-by is one which is being developed successfully in towns large and small all over Canada. A well-arranged display of plumbing fixtures reveal as attractive a class of merchandise as any—it would be hard to find an arrangement of goods that is brighter than that above.

A display of this nature does more than create just casual interest—it develops a desire on the part of the individual to have these modern conveniences installed for his own use. The atmosphere is one of cleanliness and that is just the right idea to carry out to influence the buyer to loosen his purse strings. This is the display room of the Hunt Plumbing Co., London, Ont., where the house owner can see just what class of goods he requires to complete the plumbing and heating in his own house.

panying photo will give some idea of how attractive Mr. Hunt keeps this department. As may be seen from the photo a great deal of the interior display is visible to passersby through the main show window. One display helps the other without in any way conflicting. The general effect at night when both the store and the store window are brilliantly illuminated is very striking.
